crenulate leaves, known as the Fever- or Devil-nettle. A sting from the hairs is very

painful, the effects lasting for several days.

There is one sheet in Herb. Kew. marked "Konkan Herb. Stocks," not, however, in Stocks's handwriting. It is not an uncommon experience to find it assumed that anything collected by Stocks to which no locality has been assigned was collected in the Konkan. In the present case there is not a shadow of evidence to show that the plant was collected in that division of the Presidency. Talbot says (Trees, Bomb. ed, 2, p. 333): "Does not seem to have been met with in the Presidency by any other collector since Stocks's time." It is quite inconceivable that a plant possessing such formidable stinging properties (for a full description of which a reference may be made to Beddome's Flora Sylvatica, t. 306) should have escaped notice if it existed in the Presidency. Fl. B. I. v. 5, p. 550; Brandis, For. Fl. p. 404; Bedd. Flor. Sylvat. t. 306; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 516; Watt, Dict. Econ. Prod. v. 4. p. 587.

VILLEBRUNEA INTEGRIFOLIA, Gaud. Voy. Bonite (1844-46) t. 91. A small evergreen tree with elliptic-oblong membranous leaves 6-14 in, long drying brown, and globose flower-clusters in small dichotomously branched hispid cymes from the branchlets below the leaves. Fl. B. I. v. 5, p. 589; Talb. Trees, Bomb. ed. 2, p. 334; Prain, Beng. Pl. p. 966; Watt, Diet. Econ. Prod. v. 6, part 4, p. 238.

There are 2 sheets in Herb. Kew. marked " Herb. Stock's Konkan," but not in Stock's handwriting. This seems to be a case similar to that of Laportca crenulata, in which a plant collected by Stocks, without an authentic locality-label on it, was assumed to have been collected in the Konkan. No other collectors have found the plant there, and Talbot, who has an intimate acquaintance with the plants of the South Konkan and North Kanara, remarks (l. c.): "This species has not been met with in the Bombay Presidency as far as 1 know."

CONOCEPHALUS CONCOLOR, Dalz. in Dalz. & Gibs. Bo. Fl. (1861) p. 239. Shrubby. Leaves very large, 1 ft. long, irregularly scattered, 3-nerved, perfectly smooth, oblongovate, acute, green on both sides. Female flower axillary. Decean: Phonda Ghat, Dalzell & Gibson. The above is Dalzell's description of the plant, which has not as yet been found by any other collector, and there are no specimens anywhere so far as I know. Fl. B. I. v. 5, p. 546; Talb. Trees, Bomb. ed. 2, p. 333.

ORDER CXVII. CASUARINACEÆ.

An Order with only one genus (Casuarina), of which one species (Casuarina equisetifolia, Forst. Char. Gen. [1776] p. 104, t. 52) is extensively planted but is not indigenous in the Bombay Presidency. It is a tall evergreen leafless very ornamental diccious tree, with cylindric or angled deciduous branchlets. There are large plantations in N. Kanara near the sea-coast, and, from the readiness with which it accommodates itself to coast-sands, the tree is useful in the reclamation of land from the sea (Gamble). The reddish-brown wood, known as the Beef-wood of Australia, is very heavy and hard and almost unworkable by Indian carpenters owing to its hardness. It is chiefly used for fuel. The wind, when blowing through a plantation of Casuarinas, sounds like the waves of the sea. Fl. B. I. v. 5, p. 598; Dalz. & Gibs. Suppl. p. 82; Bedd. For. Man. in Flor. Sylvat. p. ccxxvi; Trim. Fl. Ceyl. v. 4, p. 120; Talb. Trees, Bomb. ed. 2, p. 335; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517; Prain, Beng. Pl. p. 985; Watt, Dict. Econ. Prod. v. 2, p. 230. Casuarina muricata, Roxb. Fl. Ind. v. 3, p. 519; Grab. Cat. p. 196; Dalz. & Gibs. Suppl. p. 82.—DISTRIB. India (east side of the Bay of Bengal from Chittagong southwards, elsewhere planted); Malny Archipelago, Australia.

ORDER CXVIII. SALICACEÆ.

Deciduous from the periodate; stipules free. (rarely monoecious), in catkins which are similar in both sexes, each bract bearing 1 flower in its axil; bracteoles 0. Perianth 0. Disk of one or more scales or glands, or cup-shaped. Male flowers: Stamens 2 or more; filaments free or connate; anthers ovate-oblong, dehiscing longitudinally. Rudimentary ovary in normal flowers 0. Female flowers: Ovary sessile or stalked, 1-celled; ovules few or many, on 2-4 sub-basal or parietal placentas, erect, anatropous; style short or 0; stigmas short, notched or lobed. Fruit an ovoid or lanceolate 2-4-valved capsule. Seeds few or many; funicle with a pencil of long silky deciduous hairs; albumen 0; cotyledons plano-convex; radicle short, inferior.—Distrib. Genera 2; species about 180, chiefly in N. temperate regions.

1. SALIX, Linn.

Trees or shrubs. Leaves lanceolate, ovate or elliptic, entire or serrulate; petioles short, as a rule less than \(\frac{1}{4} \) the length of the leaf-blade; stipules various. Flowers small, diœcious (rarely monœcious; sometimes androgynous in \(S. \) ichnostachya \() \), in usually dense catkins; bracts small, entire. Perianth 0. Disk of 2 scales (anterior and posterior) or of one posterior scale, fleshy or glandular. Male flowers: Stamens 2-12 (in many species 2); filaments long, filiform, usually free; anthers usually small. Female flowers: Ovary sessile or stalked; placentas 2; ovules 2-seriate on each placenta, usually 4-8; style usually short with 2 short retuse or 2-fid arms. Fruit a 2-valved capsule, the valves generally rolled back. Seeds with a penicillate funicle; albumen 0; cotyledons plano-convex; radicle inferior.—Distrib. Species about 160, almost all in the Northern Hemisphere.

1. Salix tetrasperma, Roxb. Cor. Pl. v. 1 (1795) p. 66, t. 97. A much-branched tree 20-40 ft. high; bark rough with deep vertical furrows; young shoots silky, becoming glabrous. Leaves 2-5 by $\frac{5}{5}-1\frac{1}{2}$ in., lanceolate, acute or acuminate, usually serrulate, sometimes obscurely so, green and glabrous above, white and more or less silky beneath when very young; petioles $\frac{3}{5}-\frac{5}{5}$ in. long; stipules subulate, deciduous. Flowers appearing after the leaves; catkins hairy, 2-5 in. long; peduncles silky-villous, leafy at the base. Main flowers sweetscented, sessile; bracts ovate, concave, subacute, silky-villous, veined. Disk of 2 yellow glands. Stamens 5-10; filaments free, of various lengths, the longest about twice as long as the bract; anthers yellow. Fimale flowers pedicellate; bracts smaller than those of the male, oblong or obovate-oblong, hairy. Disk small, $\frac{1}{2}$ -annular, yellow, clasping the pedicel at the side opposite the bract. Ovary fusiform, glabrous;

ovules 4-6 (usually 4); stigma sessile, 2-branched, each branch 2-lobed. Capsule glabrous, \(\frac{1}{8-\frac{1}{6}} \) in. long on a long slender stalk. Seeds 4-6. Fl. B. I. v. 5, p. 626; Grah. Cat. p. 195; Dala. & Gibs. p. 220; Wight, Icon. t. 1954; Bedd. Flor. Sylvat. t. 302; Talb. Trees, Bomb. ed. 2, p. 336; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517; Plain, Beng. Pl. p. 989; Watt, Diet. Econ. Prod. v. 6, part 2, p. 391.—Flowers: Oct. Venn. Walunj.

Decean: Poona, Woodrow, Mahableshwar, Cooke', H. M. Birdwood, vale of the Yena (Mahableshwar) and other most places, Graham. S. M. Country: in various places, Law ex Graham; Belgaum, Ritchie, 159:; planted along roadsides about Belgaum, chiefly male trees, Talbot.—Distrin. India (on river-bunks and in most places), China, Miday Peninsula and Archipelago.

2. Salix ichnostachya, Lindl. in Wall. Cat. (1828) n. 3702. A moderate-sized tree. Leaves 3-6 by $\frac{\pi}{5}$ -2 in., lanceolate or elliptic-lanceolate, acute or acuminate, subcoriaceous, smooth and shining above, glancous beneath, penninerved, base usually acute; main nerves numerous, slender; petioles $\frac{1}{2}$ -1 $\frac{1}{4}$ in. long. Catkins softly woolly, often androgynous (the males and females mixed in the same catkin). Male flowers. Bracts $\frac{1}{8}$ in. long, ovate-oblong, obtuse, concave, densely woolly. Stamens 6-8. Female flowers: Bracts much smaller than in the male, $\frac{1}{16}$ - $\frac{1}{12}$ in. long, suborbicular, concave, densely woolly. Ovary sessile or nearly so; stigma sessile, short, 2-fid. Capsules sessile or nearly so, globosely ovoid, densely woolly. Fl. B. I. v. 5, p. 628; Wight, Icon. t. 1953; Talb. Trees, Bomb. ed. 2, p. 336.— Flowers: Oct.

In the specimens from Wight's Herbarium in Herb. Kew. many of the catkins are androgynous.

KONKAN and N KANARA: along river-banks, Tallot, -DISTRIB India (W. Peninsula).

Salia babylonica, Linn. Sp. Pl. (1753) p. 1017. A tree attaining 50 ft. high with drooping branches. Leaves 3-6 by ½ in., narrowly lanceolate. Flowers appearing with the leaves; catkins very slender, the male catkins ½-1 in. long, the female 1 in. long. Capsules glabrous, sessile. The Weeping Willow, well known in England, occasionally grown as an ornamental tree.—Graham says that there was a plant in Parel Garden, Bombay, reared from a cutting of the tree which grew over the tomb of Napoleon at St. Helena. Fl. B. I. v. 5, p. 629; Grah. Cat. p. 195; Dalz. & Gibs. Suppl. p. 81; Watt, Dict. Econ. Prod. v. 6, part 2, p. 388.

2. POPULUS, Linn.

Trees with scaly often resinous buds. Leaves alternate, usually broad, 3-5-nerved from the base, penninerved above, entire, toothed or lobed (in the only Bombay species very heteromorphous); stipules narrow, membranous, fugacious. Flowers often pedicellate in both sexes, dioxcious, in usually lax catkins; bracts of catkins caducous, crenate or lobed. Disk fleshy or membranous, cup-shaped, often oblique, entire, toothed or irregularly lobed. Male flowers: Stamens 4-30; filaments filiform, free; anthers usually large. Female flowers: Ovary sessile within the disk; placentas 2-3 (rarely 4); ovules many on each placenta. Capsule 2-4-valved. Seeds very small with a long and dense coma.—Distrib. Species 18, chiefly in N. temperate regions.

1. Populus euphratica, Oliv. Voy. Atlas, v. 3, p. 449, tt. 45, 46. A middle-sized usually gregarious tree 40-50 ft. high; buds slightly pubescent, not viscid. Leaves most variable in shape, those of seedlings, young trees, and young shoots linear or oblong, entire and shortly petiolate, 3-6 in. long, those of older trees usually broadly ovate, rhomboid or orbicular, 2-3 in. long and often as broad or broader than long, dentate or more or less cut or lobed, with a rounded cordate or cuneate 3-5-nerved base, the narrower leaves sometimes entire. Flowers pedicellate in both sexes; catkins glabrous. MALE FLOWERS on long slender pedicels reaching $\frac{1}{8}$ in long. Disk membranous, suborbicular, with 6-8 (usually 8) irregular acute teeth. Stamens 8-12; filaments filiform; anthers oblong, quadrangular, longer than the filaments. Female flowers: Disk membranous, caducous, tubular, with 8-12 linear segments. Stigmas 2-3, more or less irregularly crescent-shaped, narrowed into a short style. Capsules $\frac{1}{4}$ in long, ovoid-lanceolate, turgid, 2-3- (commonly 3-) valved; pedicels shorter than the capsules. Seeds narrowly ellipsoid, acute at both ends, $\frac{1}{25}$ in. long, enveloped in a mass of silky hairs. Fl. B. I. v. 5, p. 638; Talb. Trees, Bomb. ed. 2, p. 336; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517; Watt, Dict. Econ. Prod. v. 6, part 1, p. 326.—Flowers: Feb., nearly leafless in January. Vern. Bán.

In the Bombay Presidency confined to Sind. Sind: Ritchie, 690!, Stocks, 424!, Dalzell!, Woodrow.—Distrib. India (Panjab); W. Thibet, Beluchistan, Afghanistan, westwards to Syria and Egypt.

The wood is largely used for fuel in Sind.

ORDER CXIX. CERATOPHYLLACEÆ.

Submerged slender fragile branched herbs. Leaves whorled, dichotomously cleft into filiform minutely toothed lobes; stipules 0. Flowers minute, monocious, axillary, sessile. Male flowers solitary. Perianth (or involucre) of 6-12 narrow subvalvate 2-fid segments. Stamens 20-30; filaments very short; anthers erect, extrorse, dehiscing longitudinally; connective truncate or 2-toothed at the apex. FLOWERS: Perianth of the male. Ovary sessile, ovoid, 1-celled; ovule solitary, pendulous, orthotropous; style subulate, stigmatic on one side. Fruit a small coriaceous ovoid or ellipsoid somewhat compressed nutlet. terminating in a long subulate style with a spur projecting from the base on either side. Seed pendulous; testa membranous; albumen 0; embyro straight; cotyledons thick; radicle short, inferior; plumule many-leaved.—Distrib. Genus 1; species 1, very variable, in all temperate and tropical countries.

1. CERATOPHYLLUM, Linn.

Characters of the Order.

1. Ceratophyllum demersum, Linn. Sp. Pl. (1753) p. 992. Whole plant 8-36 in. long, forming a much-branched tangle of slender branches and leaves which collapse in a tassel when taken out of the water. Leaves about 1 in. long; segments spreading in water, variable in thickness and amount of toothing. Male flowers solitary, in separate axils from the female but on the same plant. Perianth (or involucre) of 6-12 narrow 2-fid segments. Stamens 10-30, sessile;

anthers large, white (Clarke). Female Plowers: Perianth (or involucre) as in the male, often with an entire acute (not 2-fid) apex. Ovary sessile, 1-celled; style subulate. Fruit very variable. Fl. B. I. v. 5, p. 639; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517; Engler, in Engl. & Prantl, Pflanzenf. v. 3, part 2, p. 11, fig. 12; Prain, Beng. Pl. p. 990. Ceratophyllum verticillatum, Roxb. Hort. Beng. (1814) p. 68, & Fl. Ind. v. 3 (1832) p. 624; Trim. Fl. Ceyl. v. 4, p. 120.

Sir Joseph Hooker (Fl. B. I. l. c.) considers the Indian species of Chamisso and Wallich to be referable to this, but at the same time is of opinion that an examination of living specimens is necessary for verification. Wight and Arnott (Prodr. pp. 300 & 310) give 3 Indian species figured in Wight's 'Icones,' but suggest that these might perhaps be regarded as forms of *C. verticullatum*, Roxb., which Sir J. Hooker makes synonymous with *C. demersum*. The following are the 3 species given by Wight and Arnott:—

C. tuberculatum, Oham. in Linnæa, v. 4 (1829) p. 504, t. 5, fig. 6 d. Fruit ellipsoid, slightly compressed, wingless; spines at first slender and weak, afterwards strong; sides of the fruit convex, finely tuberculate. Wight & Arn. Prodr. p. 309; Wight,

Icon. t. 1948, fig. 3.

C. muricatum, Cham. in Linnma, v. 4 (1829) p. 504, t. 5, fig. 6 c. Fruit ellipsoid, slightly compressed, winged; spines slender, weak; wing narrow, regularly many-toothed; sides of the fruit convex, more or less muricated, particularly towards the apex. Wight & Arn. Prodr. p. 309; Wight, Icon. t. 1948, figs. 1, 2. C. platyacanthum, Cham. I. c. fig. 6 a; Engl. in Engl. & Prantl, Pflanzenf. v. 3, part 2, p. 12.

**C. missionis, Wall. Cat. (1828) n. 7007. Fruit ellipsoid, slightly compressed, winged; spines elongate, the lateral ones flattened; the wing broader downwards and decurrent along the base of the spines, with a few irregular teeth; sides of the fruit convex, fluely tuberculate. Wight & Arn. Prodr. p. 310; Wight, Icon. f. 1948, fig. 4.

ORDER CXX. GNETACEÆ.

Trees or shrubs; branches jointed at the nodes. Leaves opposite, large and green or minute and scale-like; stipules 0. Flowers 1-sexual, monocious or diocious, in axillary or terminal spikes or cones. Male flowers: Perianth valvately 2-lobed or spathaceous. Stamens commate in a column of united filaments; anthers 2-8, globose, 1-3-celled, sessile or subsessile on the column. Finally flowers: a naked erect ovulo with 2-3 coats, of which one is produced into a styliform tube with a discoid mouth. Seed dry or drupe-like; albumen copious or scanty; embryo straight; cotyledons appressed; radicle long, superior.—Distrib. Genera 3; species about 40, in temperate and tropical regions.

1. EPHEDRA, Linn.

Erect or subscandent rigid shrubs; branches opposite or whorled, terete, striate, with membranous sheaths at the nodes, which often bear narrow leafy blades. Flowers unisexual, usually diocious. Malin rlowers in short bracteate spikelets which are whorled or in pairs. Perianth of 2 opposite compressed membranous sepals. Anthers 2-8, on a central column, 2-celled, opening by a short slit at the apex. Female flowers usually in pairs, sometimes 3 or solitary, each flower consisting of 1 ovule with a single integument prolonged into a styliform

tube (tubillus) and enclosed in a bag (? perianth), each female inflorescence supported by several pairs of decussate bracts. Fruit (in the Indian species) fleshy, consisting of several succulent bracts enclosing 1 or 2 seeds.—DISTRIB. Dry regions of Europe, N. Africa, Asia, and America; species 31.

1. Ephedra foliata, Boiss. Fl. Orient. v. 5 (1881) p. 716. diecious or monecious climbing shrub reaching 15 ft. long or more (rarely prostrate or hanging from walls); branches often fascicled, slender; bark green or glaucescent, smooth, striate; buds terminal, minute, shortly ovate or more or less elongate. Leaves 2, 3, or 4, shortly connate at the base, $1-1\frac{1}{6}$ in. long by $\frac{1}{45}$ in. broad, linear-setaceous. Mann FLOWERS: Spikelets ovate, obtuse, tetragonal, in pairs, or 3 together, or solitary, of various lengths, often with a peduncle 1-12 in. long; flowers 6-24; bracts rotund, obtuse, connate for $\frac{1}{3}$ their length, $\frac{1}{16}$ in. long and as broad as long. Perianth obovate, exceeding the bracts. Staminal-column equalling the perianth or shortly exserted. FLOWERS: Floral galbuli in depauperate usually nodding cymes, ovate, on long peduncles or in short fascicles, with 3 pairs of bracts. usually in pairs, equalling the bracts. Integument at first oblong, obtusely trigonous; tubillus exserted, straight, short. Fruit globose, 1 in. in diam., semitransparent, red or milky-white, showing 2 dark-colored seeds. Stapf, Die Art. der Gatt. Ephed. (1889) p. 49. Ephedra peduncularis, Boiss. Fl. Orient. v. 5 (1881) p. 717; Hook. f. Fl. B. I. v. 5, p. 641; Talb. Trees, Bomb. ed. 2, p. 337; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517; Watt, Dict. Econ. Prod. v. 3, p. 251. E. Alte, Brandis, For. Flor. p. 501, t. 69 (not of C. A. Meyer).—Flowers: Mar.-Apr.

In the Bombay Presidency confined to Sind. Sind: Woodrow, Stocks, 449!; hills at the Hub near Karachi, Bhola Puran!; near Schwan, Dalzell, 7!—Distrib. India (Panjáb, Rajputana); Afghanistan to Syria.

2. GNETUM, Linn.

Evergreen climbing shrubs or erect trees; branches jointed. Leaves opposite, entire, penninerved. Flowers monœcious or diœcious, whorled, in the axils of the cupular bracts of axillary or terminal solitary or paniculate spikes, often surrounded by jointed hairs. Male flowers: Perianth narrowly clavate, entire or valvately 2-fid. Stamens adnate to the base of the perianth; filaments connate in a column, exserted from the mouth of the perianth; anther-cells 2, distinct, sessile on the top of the column, opening by terminal slits. Female flowers (some imperfect): Ovule ovoid or globose, the inner integument produced into a slender exserted tube with often a toothed or fimbriate mouth. Seed drupe-like.—Distrib. Tropical Asia, Africa, America, Pacific Islands; species about 15.

1. **Gnetum scandens,** Rowb. Hort. Beng. (1814) p. 66. A lofty discious climber with dichotomous branches; bark thick, scaly; young shoots jointed and swollen at the insertion of the leaves. Leaves opposite, $4\frac{1}{2}$ -6 by 2-3 in., ovate-oblong or elliptic, obtusely acuminate, smooth and polished, hase obtuse or very shortly cuneate; main nerves 6-8 pairs, slender, with lax reticulate venation between; petioles $\frac{1}{4}$ - $\frac{1}{2}$ in.

long. Flowers in stiff paniculate spikes (generally one or two opposite pairs of cylindric spikes and a terminal one); bracts of the male flowers closely imbricate, those of the female interrupted. Fruiting spikes 3-10 in. long. Stigma 3-fid. Fruit somewhat olive-shaped, drupaceous, 1-1½ in. long, of a reddish-orange color when ripe, obtuse at the apex, narrowed at the base into a short stout stalk, the pulp intermixed with many tender spicules. Fl. B. I. v. 5, p. 642; Grah. Cat. p. 188; Dalz. & Gibs. p. 246; Talb. Trees, Bomb. ed. 2, p. 337; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517; Prain, Beng. Pl. p. 991; Watt, Dict. Econ. Prod. v. 3, p. 518.—Flowers: Dec.-Mar. Venn. Kombal; Umbli.

KONKAN: Law!, Dalzell!; dense jungles below the Ghâts, Dalzell! Decens: ravines at Par, below Mahableshwar, Graham; Lanoli, Graham, Woodrow; Phonda Ghât, Ritchie, 954! S. M. Couvery: Oastlerock, Kanitkar! Kakaka: common in the moist forests of N. Kanara, abundant in the evergreen forests of the Supa Ghât, Talhot.—Distrib. India (Sikkim, Assam, Khasia Hills, Chittagong, Birma, Andamans, W. Peninsula); Malay Peninsula and Archipelago, China.

ORDER CXXI. CONIFERÆ.

There are no plants of the Order indigenous to the Bombay Presidency. The following are the principal species grown in gardens:—

Cupressus glauca, Lam. Encyc. Méthod. v. 2 (1786) p. 243. A tree of very upright habit, with numerous short branches covering the stem, extensively grown as an ornamental tree, but does not succeed below the Gháts and above only when the soil is rich and deep (Dalzell & Gibson). It is known as the Goa Cypress or Cedar of Goa. Fl. B. I. v. 5, p. 645; Grah. Cat. p. 196; Dalz. & Gibs. Suppl. p. 83; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517, & Gard. in Ind. ed. 5, p. 459; Watt, Dict. Econ. Prod. v. 2, p. 646.

Cupressus sempervirens, Linn. Sp. Pl. (1753) p. 1002. A tall tree, attaining 100 ft. high and 9 ft. in girth of trunk, a native of Europe. Foliage dark green. Leaves ovate-oblong, convex, with a gland on each side. Fl. B. I. v. 5, p. 645; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517, & Gard. in Ind. ed. 5, p. 459; Watt, Dict. Econ. Prod. v. 2, p. 646.

Cupressus torulosa, D. Don, Prodr. Fl. Nep. (1825) p. 55. A tall tree, a native of the W. Himalaya, attaining 150 ft. high, with a girth of trunk of 17 ft. Leaves $\frac{1}{20}$ in. long, triangular-ovate obtuse, with an oblong gland on either side of the midrib. Fl. B. I. v. 5, p. 645; Dalz. & Gibs. Suppl. p. 83; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517; Watt, Dict. Econ. Prod. v. 2, p. 646.

Cupressus funebris, Endl. Syn. Conif. (1847) p. 58. A handsome tree, a native of China, attaining 60 ft., with dark green foliage, wide-spreading branches and pendulous distictions branchets. Fl. B. I. v. 5, p. 646; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517, & Gard. in Ind. ed. 5, p. 459; Watt, Dict. Econ. Prod. v. 2, p. 645.

Juniperus communis, Linn. Sp. Pl. (1753) p. 1040. The Common Juniper, occurring in India in the Western Himalaya and distributed to

temperate and subarctic regions in Europe, Asia, N. Africa, and N. America, is sometimes grown in gardens. Fl. B. I. v. 5, p. 646; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517, & Gard. in Ind. ed. 5, p. 459; Watt, Dict. Econ. Prod. v. 4, p. 552.

Juniperus chinensis, Linn. Mantiss. 1 (1767) p. 127. A dwarf conical bluish-green shrub of slow growth. Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517, & Gard in Ind. ed. 5, p. 459.

Araucaria excelsa, R. Br. in Ait. Hort. Kew. ed. 2, v. 5 (1813) p. 412. The Norfolk Island Pine, a native of Norfolk Island, a very handsome species with graceful feathery branches. Woodr. Gard. in Ind. ed. 5, p. 458.

Araucaria Cookii, R. Br. ex D. Don, in Trans. Linn. Soc. v. 18 (1841) p. 164. A native of New Caledonia, resembling the last, but of more irregular outline. Woodr. Gard. in Ind. ed. 5, p. 458.

Araucaria Cunninghamii, Sweet, Hort. Brit. ed. 2 (1830) p. 475. A large tree of rapid growth with whorls of branches often 4 feet apart, a native of Queensland. Woodr. Gard. in Ind. ed. 5, p. 458; Watt, Dict. Econ. Prod. v. 1, p. 289.

Araucaria Bidwilli, Hook. Lond. Journ. Bot. v. 2 (1843) p. 503, tt. 18, 19. A native of Australia, with triangular leaves about 1 in. in length. A delicate species in the plains of India, but thrives well in a conservatory covered with coir matting. Woodr. Gard. in Ind. ed. 5, p. 458.

ORDER CXXII. CYCADACEÆ,

There are no plants of the Order indigenous to the Bombay Presidency. The two following species are commonly grown in gardens for ornamental purposes:—

Cycas Rumphii, Miq. in Bull. Sc. Phys. Nat. Néerl. (1839) p. 45. A palm-like evergreen tree with leaves 5-8 ft. in length, abundant in the Malabar and Cochin forests. Fl. B. I. v. 5, p. 657; Prain, Beng. Pl. p. 993; Watt, Dict. Econ. Prod. v. 2, p. 675. Cycas circinalis, Roxb. Fl. Ind. v. 3, p. 744 (not of Linn.); Dalz. & Gibs. Suppl. p. 83; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517, & Gard. in Ind. ed. 5, p. 461; Watt, Dict. Econ. Prod. v. 2, p. 675.

Cycas revoluta, Thunb. Fl. Jap. (1784) p. 229. A more dwarf species than the former with smaller leaves, a native of Japan. Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517, & Gard. in Ind. ed. 5, p. 461; Prain, Beng. Pl. p. 993; Watt, Dict. Econ. Prod. v. 2, p. 675.

ORDER CXXIII. HYDROCHARITACEA: *.

Aquatic usually submerged herbs. Leaves undivided. Flowers regular, monœcious or regular

^{*} From $\tilde{v}\delta\omega\rho$ water, and $\chi\acute{a}\rho\iota s$ grace. The genitive of $\chi\acute{a}\rho\iota s$ is $\chi\acute{a}\rho\iota\tau s$; hence the Order should be written Hydrocharitacex not Hydrocharidacex.

or 2-leaved spathe; females solitary; perianth superior. Sepals 3, green or petaloid. Petals membranous or 0. Main flowers: Stamens 3-12 in 1-4 series; anthers 2-celled. Finally flowers: Ovary inferior, 1-celled; placentas 3-6, parietal or intruded, sometimes almost meeting at the axis; ovules numerous on each placenta, anatropous or orthotropous; styles or style-arms 3-12. Fruit globose or ovoid, dry or pulpy (rarely dehiscent). Seeds few or many; albumen 0; embryosmooth or lineate.—Distrib. Warm regions of the world; genera 14; species about 40.

•	
Stems branching, leafy; leaves small; spathes small, sessile.	•
Leaves whorled; styles undivided; ovules anatropous	1. Hyprilla.
Leaves scattered; styles notched; ovules orthotropous	
Stems 0, or with stolons only, or a creeping rootstock.	
Leaves all long and narrow, sessile; male scapes many-	
flowered.	• •
Perianth single	
Perianth double	
Leaves mostly or all petiolate; flowers solitary	5. Ottelia.

1. HYDRILLA, Rich.

A submerged leafy fresh-water herb. Leaves short, 3-4-nately whorled or the lower opposite. Flowers minute, diœcious, the males shortly pedicellate, solitary in a subglobose muricate spathe, the females sessile, 1-2 in a tubular 2-toothed spathe. Male flowers: Sepals 3, ovate or obovate, green. Petals 3, oblong or cunciform. Stamens 3; anthers large, reniform, opening elastically. Pistillede minute. Finally flowers: Sepals 3, linear, green. Petals 3, narrow. Ovary produced beyond the spathe into a filiform beak, 1-celled; ovules anatropous; styles 2-3, linear, undivided; stigmas fimbriate. Fruit subulate, smooth or muricate. Seeds 2-3, oblong, minute; testa produced at both ends.—Distrib. Central Europe, Mauritius, Madagascar, Tropical Asia and Australia; species 1.

1. Hydrilla verticillata, Presl, Bot. Bemerk. (1844) p. 112. Fresh-water plants forming large masses; stem slender, 1 ft. and more long, with fibrous roots, much branched, flaccid, with long or short internodes, often rooting from the nodes; branches with a short sheathing leaf at the base. Leaves \(\frac{1}{4-\text{3}}\) by \(\frac{1}{12}\)-\frac{1}{6}\] in, sessile, 4-8 in a whorl (the lowest often opposite), linear or linear-oblong, apiculate, entire or servalate; midrib strong. Flowers \(\frac{1}{6}\)-\frac{1}{6}\] in, long; perianth-segments very variable. Fruit smooth or muricate. The little membranous spathe of the male flowers ultimately splits and liberates the flower, which rises to the top of the water, where it floats, expands, and scatters its pollen. Fl. B. I. v. 5, p. 659; Dalz. & Gibs. p. 277; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517; Prain; Beng. Pl. p. 995; Watt, Diet. Econ. Prod. v. 4, p. 310. Hydrilla ovalifolia, Rich. in Mém. Inst. Fr. v. 12, part 2 (1811) p. 76, t. 2; Trim. Fl. Ceyl. v. 4, p. 123. Serpicula verticillata, Linn. f. Suppl. (1781) p. 416; Roxb. Cov. Pl. v. 2 (1798) p. 33, t. 164; Fl. Ind. v. 3, p. 578.— Flowers: Dec.

Common in tanks taroughout the Presidency. Konkan: Uran (Bombay Harbour), Stocks! Diccan: Tanks near Poona, Cooke!, Woodrow; Bijapur, Cooke! Sind: Manchar Lake, Stocks, 1107!—Distrib. Of the genus.

2. LAGAROSIPHON, Harv.

Submerged fresh-water herbs. Leaves scattered, fasciculate or subverticillate, serrulate, the lower sometimes opposite. Flowers diecious; the males minute, many, in an ovoid 2-fid axillary sessile spathe, the females solitary, sessile in a narrow oblong spathe. Sepals 3, petaloid. Petals rather shorter than or as long as the sepals. Male flowers: Stamens 2 or 3; filaments short; anthers ovate; staminodes often 2-3. Pistillode 0. Female flowers: Staminodes 0. Ovary oblong, produced into a filiform beak; ovules many, orthotropous; styles 3, stout, notched. Fruit ovoid, oblong or linear; pericarp membranous. Seeds numerous; testa with a mucous coat.—Distrib. India, Africa, Madagascar; species 9 or 10.

1. Lagarosiphon Roxburghii, Benth. in Gen. Pl. v. 3, part 2 (1883) p. 452. Stem 2-3 ft. long, filiform; roots fibrous; upper branches floating. Leaves 3-4 by \(\frac{1}{4} \) in., alternate and opposite, sessile, oblong-lanceolate, acute, minutely serrulate. Male flowers: Spathe ovoid, at length 2-valved, enclosing many minute, shortly pedicellate flowers. Sepals broadly oblong, pink. Petals as long as the sepals or nearly so, white. Stamens 2; anthers dehiscing transversely. Female flowers: Spathe \(\frac{1}{6} \) in. long, tubular, 2-fid. Ovary lanceolate, produced into a filiform flexuous beak 2-3 in. long. Fl. B. I. v. 5, p. 659; Trim. Fl. Ceyl. v. 4, p. 124; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517; Prain, Beng. Pl. p. 995. Nechamandra Roxburghii, Planch. in Ann. Sc. Nat. sér. 3, v. 11 (1849) p. 78 (exclud. syn. Roxb. Cor. Pl.); Dalz. & Gibs. p. 277. Valisneria alternifolia, Roxb. Hort. Beng. (1814) p. 71; Fl. Ind. v. 3, p. 750; Wight, in Hook. Bot. Misc. v. 2, p. 344, Suppl. t. 11; Grah. Cat. p. 199.—Flowers: Aug.—Feb.

Tolerably common in tanks throughout the Presidency.—DISTRIB. Throughout India; Ceylon, Tropical Asia.

3. VALLISNERIA, Linn.

A submerged tufted stemless stoloniferous herb. Leaves very long, linear. Flowers diœcious, the males many, minute, in an ovoid 3-lobed, shortly pedunculate spathe, the females solitary in a tubular 3-toothed spathe terminal on a very long filiform spiral scape. Sepals 3. Petals 0. Male flowers: Stamens 1-3; filaments rather thick; anthers didymous. Pistillode 0. Female flowers: Staminodes 3, each 2-fid. Ovary narrow, not produced upwards; ovules numerous; stigmas 3, broad, notched. Fruit linear, included in the spathe. Seeds numerous, oblong; testa membranous.—Distrib. Species about 4, in the warmer regions of both hemispheres.

1. Vallisneria spiralis, Linn. Sp. Pl. (1753) p. 1015. Leaves radical, narrow, linear, varying in length with the depth of the water, reaching sometimes 15 by ½ in., green, translucent, entire or the tips serrulate. Male flowers numerous, minute. Spathe shortly pedunculate, ¼ in. long, breaking off at the base when the flowers emerge and float on the surface of the water. Pedicels long, slender. Stamens 1-3. Flimale flowers solitary. Spathe 3-toothed, carried to the surface of the water in flower by the uncoiling of the long filiform spiral scape,

which, after fertilization, again coils close and brings the ovary down to ripen under water. Fruit linear, included in the spathe, many-seeded. Fl. B. I. v. 5, p. 660; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517; Prain, Beng. Pl. p. 996; Watt, Dict. Econ. Prod. v. 6, part 4, p. 220. Vallisneria spiraloides, Roxb. Hort. Beng. (1814) p. 71; Grah. Cat. p. 200.—Flowers: Apr.—May. Venn. Saivala.

More or less abundant throughout the Presidency. Konkan: Law! Deccan; Poona, Woodrow; Kirkee, in the Mula River, J. G. Woodrow! Sind: Stocks!, Ritchie, 695!—
Distrin. Throughout India; westward to Spain and in warm regions of the Old and New Worlds.

4. BLYXA, Noronha.

Annual submerged tufted scapigerous herbs. Leaves linear, acute, entire or minutely serrulate. Flowers hermaphrodite or diocious; scapes long or short; males pedicellate, several in a tubular 3-toothed spathe; hermaphrodite or female flowers solitary sessile, within a tubular 2-toothed spathe. Sepals 3, linear. Petals 3, linear, longer than the sepals. Male flowers: Stamens normally 3-seriate, 1 or more often reduced to staminodes; authers narrow, erect. Pistillodes 3, slender. Fimale flowers: Staminodes 0 or minute. Ovary linear, 1-celled, beaked; placentas parietal; ovules many; style very short; stigmas 3, fliform. Fruit linear, included in the ribbed narrow ventricose spathe; pericarp membranous. Seeds numerous, oblong, smooth or tuberculate, often tailed.—Distribe. Tropical Asia, Australia, Sumatra; species 7 or 8.

Flowers diacious: seeds with short tails.

Leaves broad at the base, 8-24 in. long, narrowed upwards to the acuminate tip; seeds $\frac{1}{24}$ in. long, tuberculate ... Leaves narrowed from below the middle to the base, 4-6 in. long; seeds $\frac{1}{6}$ in. long, strongly echinate

- 1. B. Roxburghii.
- 4-6 in. long; seeds § in. long, strongly echinate 2. B. Talboti.
 Flowers hermaphrodite; seeds with long filiform tails 3. B. cchinosperma.
- 1. Blyna Roxburghii, Rich. in Mém. Inst. Fr. (1811) p. 77, t. 5. Leaves 8-24 by $\frac{1}{4}-\frac{1}{2}$ in., radical, linear, broad at the base, finely acuminate at the apex. Flowers diocious, white. Male flowers: Scape straight, as long as or rather longer than the leaves. Stamens 8; filaments of unequal lengths, shorter than the petals. Female flowers: Scape shorter and thicker than in the male. Fruit 2-4 by $\frac{1}{6}$ in. Seeds small, $\frac{1}{24}$ in. long, distinctly tuberculate, shortly tailed. Fl. B. I. v. 5, p. 660; Woodr, in Journ. Bomb. Nat. v. 12 (1899) p. 517; Prain, Beng. Pl. p. 996. Vallisneria octandra, Roxb. Cor. Pl. v. 2 (1798) p. 34, t. 165; Grab. Cat. p. 199—Flowers: Feb.

In still water throughout the Presidency, tolerably common.—Distrib. Tropical Asia and Australia.

2. Blyna Talboti, Hook. f. Fl. B. I. v. 5 (1888) p. 661. Leaves 4-6 by $\frac{1}{5}$ in., linear-lanceolate, serrulate. Flowers 1-sexual. Capsules 1-2 by $\frac{1}{5}$ in. Seeds very strongly echinate with a short tail at each end. Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517.—Flowers: Aug.

There is but one sheet in Herb. Kew., the specimens on which are female plants only. I have not seen any male flowers.

KANARA: Karwar, Talbot, 287!

3. Blyxa echinosperma, Hook. f. Fl. B. I. v. 5 (1888) p. 661. An annual almost stemless herb growing in shallow and deep water. Leaves variable in length, 6 in: to 4 ft. long by $\frac{1}{5}-\frac{1}{2}$ in. broad, narrowly linear, with entire or (under the lens) minutely denticulate margins. Flowers hermaphrodite, 1 in each spathe. Scapes filiform, elongate, 1-3 ft. long or more, depending on the depth of water. Sepals 3, narrowly linear, obtuse, greenish. Petals white, often spirally twisted at the tip. Stamens 3. Stigmas 3. Capsules 2-3 by $\frac{1}{8}$ in., terete. Seeds spinescent, sometimes $\frac{1}{2}$ in. long (including the tails), with a long fliform tail at each end. At the time of flowering the deep-water plants become detached from the bottom and float on the surface (Talbot). Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 517; Prain, Beng. Pl. p. 996. $Hydrotrophus\ echinospermus$, C. B. Clarke, in Journ. Linn. Soc. v. 14 (1875) p. 8, t. 1.—Flowers: July-Oct.

Stocks without locality in Herb. Kew.! Deccan: Mahableshwar, Cooke!, Woodrow. S. M. Country: Belgaum, Ritchie, 1392! Kanara: Yellapur, common in tanks, Talbot, 287!—Distrib. India (Bengal, W. Peninsula).

5. OTTELIA, Pers.

Submerged or partially floating fresh-water herbs; root fibrous. Leaves radical, crowded, of 2 forms, the submerged narrow, shortly petiolate, the floating ovate-lanceolate, oblong or cordate with long petioles. Flowers solitary, hermaphrodite, sessile within a tubular long-pedunculate spathe. Sepals 3, linear or oblong. Petals 3, longer than the sepals, obovate or orbicular, with fleshy basal appendages. Stamens 6-15, in 2-5 series; anthers erect. Ovary oblong, beaked, almost 6-celled; ovules many; placentas diffuse; styles 6, linear, 2-fid. Fruit oblong, enclosed in the spathe, 3-6-winged. Seeds many, oblong; testa pulpy.—Distrib. Species 6 or 7, tropical and subtropical.

1. Ottelia alismoides, Pers. Syn. Pl. v. 1 (1805) p. 400. A succulent flaccid herb; roots fibrous. Leaves usually submerged, very variable, 2-6 by 1-3 in. (when orbicular reaching 7 in. in diam.), oblong or orbicular, cordate, membranous, undulate, 7-11-nerved; petioles 3-gonous, their length depending on the depth of the water. Flowers solitary. Spathe 1-1½ in. long, 5-6-winged; peduncles varying in length with the depth of water; wings of spathe undulate, unequal; mouth 5-6-toothed. Sepals small, oblong, green. Petals nearly orbicular, 1 in. broad, white with a yellow base, reticulately veined. Ovary narrowly oblong; placentas 6-12. Fruit 1-1½ in. long, ellipsoid, crowned by the withered perianth. Fl. B. I. v. 5, p. 662; Trim. Fl. Ceyl. v. 4, p. 125; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Prain, Beng. Pl. p. 997. Ottelia indica, Planch. MS. ex Dalz. & Gibs. Bo. Fl. (1861) p. 278. Damasonium indicum, Willd. Sp. Pl. v. 2 (1799) p. 276; Grah. Cat. p. 200; Bot. Mag. t. 1201.—Flowers: Dec.-Apr.

Common in tanks, Dalzell & Gibson. Konhan: Stocks; Bombay, Nimmo ex Graham. Deccan: Poona, Woodrow; Bijapur, Cooke!; Kolhapur, Cooke! Gujarat: Bulsar, Dr. Lush ex Graham.—Distrib. Throughout India; Ceylon, Tropical Asia, Australia.

ORDER CXXIV. BURMANNIACEÆ.

Erect herbs, annual or with a perennial rootstock, simple or sparingly branched. Leaves chiefly radical or reduced to scales or 0. Flowers hermaphrodite, regular, solitary, terminal, or unilaterally spicate or racemose on a forked rhachis with a bract opposite each. Perianth superior, corolline, persistent, 6-lobed or 6-cleft (rarely 3-lobed); lobes valvate. Stamens 3 or 6, included, adnate to the perianth-tube or throat; filaments very short or 0; anthers 2-celled, dehiscing transversely or longitudinally. Ovary inferior, 3-celled with axial placentas, or 1-celled with 3 parietal placentas; ovules many, minute. Fruit a loculicidal capsule, or opening vertically. Seeds many, minute, reticulate; albumen 0; embryo homogeneous.—Distrip. Throughout warm regions in both hemispheres; genera 10; species 54.

1. BURMANNIA, Linn.

Annual herbs; stems simple or divided. Leaves ensiform, acuminate, radical, sometimes reduced to scales or 0. Flowers solitary or few. Perianth-segments 2-seriate, connate in a winged or angled tube; segments of outer series 3, of inner also 3, smaller, sometimes obsolete. Stamens 3, sessile or subsessile; anther-cells short, separated by a broad connective, dorsally crested, dehiscing transversely. Ovary 3-celled; style short; stigma 3-lobed. Fruit a capsule more or less 3-winged, opening loculicidally between the wings, or sometimes rupturing transversely. Seeds minute, oblong or subglobose.—Distrib. Tropics of both hemispheres; species about 20.

1. Burmannia cælestis, Don, Prodr. Fl. Nep. (1825) p. 44. Van. pusilla, Trim. Fl. Ceyl. v. 4 (1898) p. 131. Stem 3-6 in. (rarely reaching 7 in.) high, very slender. Leaves very few, scale-like, sessile along the stem, $\frac{1}{10}\frac{1}{6}$ in. long, lanceolate-subulate. Flowers $\frac{1}{4}-\frac{1}{2}$ in. long, obcordate or orbicular in outline, blue or purple, solitary or 2-3 together (often 3 when the central flower is sessile, the others stalked). Calyxtube winged, the wings rounded, truncate or retuse at the top. Petals minute.—Flowers: Sept.-Oct.

This is the common form. I have never seen a specimen of B. calestis proper from the Bombay Presidency. Burmannia pusilla (sp.), Thw. Enum. p. 325; Hook. f. Fl. B. I. v. 5, p. 665; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518. B. triflora, Roxb. Fl. Ind. v. 2 (1832) p. 117 in part; Dalz. & Gibs. p. 271. B. disticha, Grab. Cat. p. 223 (not of Linn.). Gonyanthes pusilla, Miers, in Trans. Linn. Soc. v. 18 (1841) p. 537, t. 38, fig. 3.

KONKAN: hot springs near Mahar, Dalzell & Gibson; Matheran, Cooke!, H. M. Birdwood. Decean: Mahableshwar, Cooke!, Woodrow! S. M. Country: Castlerock, Talbot, 2588!

ORDER CXXV. ORCHIDACEÆ.

Herbs (rarely shrubby), usually either (1) terrestrial often tuberousrooted with annual herbaceous leafy or leafless simple stems and with solitary or spicate or racemose flowers, or (2) epiphytes with perennial stems or branches usually leafy, variously thickened and often forming a

pseudobulb, flowering from the top, sides, or base of the pseudobulb; bracts usually present. Flowers hermaphrodite, irregular, often showy. Perianth superior, of 6 free or variously connate segments, 2-seriate; 3 outer segments (sepals) more or less similar, the 2 lateral sometimes connate in a short or long sac or spur-like base (mentum); 3 inner segments dissimilar, the 2 lateral alike and often resembling the sepals, the remaining petal (lip) usually very differently shaped. Stamens and style united in a column opposite the lip; anther usually 1 (sometimes 2) on the front, top, or back of the column and free or adnate to it, 2-celled or, by subdivision, 4-celled; top of the column sometimes produced towards the lip into a beak (rostellum); pollen-grains usually coherent in each cell into 1, 2, or 4 pairs of oblong or globose or pyriform waxy or powdery masses (pollinia), which are free or adnate by pairs or fours immediately or by a stalk (caudicle) to a gland. Ovary inferior, 1-celled, usually linear or twisted; ovules many, minute; stigma one or two viscid spots on the top or concave face of the column, opposite the lip and below the anther. Fruit a capsule, usually opening by 3 or 6 longitudinal fissures (rarely fleshy and subindehiscent). Seeds very many, minute, with a lax hyaline testa enclosing a homogeneous nucleus.—Distrib. Genera 340; species about 5000, temperate and tropical (rarely arctic).

Pollinia waxy.

Pollinia free or those of each cell held together at the base by a viscid appendage, not attached by their bases or by a caudicle to the rostellum.

Pollinia 4.

Leaves equitant

Leaves not equitant.

Terrestrial or epiphytic herbs; leaves membranous, usually sessile; inflorescence terminal; flowers rather small, in racemes or spikes; column prolonged below into a foot.

Lip with basal auricles; column very short with broad arms; terrestrial

herbs
Lip without basal auricles; column long with callosities or wings or both; rostellum sometimes double; terrestrial or epiphytic herbs

Epiphytic herbs; leaves chartaceous or coriaceous; column more or less prolonged below into a foot.

Stems solitary or exspitose or composed of discrete pseudobulbs basally attached on a short or long rhizome.

 1. OBERONIA.

2. MICROSTYLIS.

3. Laparis.

4. DENDROBIUM.

Flowers from lateral scapes rising from the base of the pseudobulbs or from the rhizome between them, solitary or in heads, umbels, or racemes; leaves solitary and coriaceous, or binary and chartaceous, usually from the apices of pseudobulbs on a generally prolonged rhizome (occasionally the rhizome and less often the pseudobulbs inconspicuous or absent); pollinia free or occasionally attached by their bases to a small ball of translucent tissue, the inner primalways smaller than the outer. Lateral sepals greatly exceed-		
ing the dorsal; flowers unbellate Lateral sepals not greatly exceeding the dorsal. Lateral sepals alongside or under the lip; flowers	5.	Cirrhopetalum.
racemose or spicate; pollinia free Lateral sepals spreading; scape 1-flowered; pol-	6.	Bulbornyllun.
linia subcoherent in pairs in each cell Stems jointed, composed of clongated pseudobulbs strung on a woody core; leaves solitary or binary, chartaceous;	7.	Trias.
flowers in racemes; column footless. Tufted stemless herbs; leaves radical; pseudobulbs 0; flowers in panicles;		Риомпота.
column footless	9.	Josephia,
Sepals connivent at the base, all or the lateral only connate; pseudobulbs small, discoid, reticulate		,
adnate to the base of the footless column, shortly spurred; side lobes involving the column; midlobe fringed; pollinia attached by fours to a granular membrane	12.	THUNIA.
Stem pseudobulbons or tuberous at the base, Terrestrial herbs; flowers in pedunculate racemes; leaves plicate.		

Shiffed Ht the Dase: Innorescence	
spurred at the base; inflorescence	
strict 13. Evlorma.	
Lip obscurely 3-lobed, wide-ventricose,	
but not spurred at the base; inflores-	
cence at first decurved 14, Geodorum.	
Epiphytic herbs with long linear sheathing	
leaves on usually a large fleshy pseudo-	
bulb: lobes of the lin embracing the un-	
winged column	
Stem not pseudobulbous nor tuberous at the	
base.	
Column prolonged into a foot.	
Spur erect or parallel to the blade of	
the lip, pointing forwards; lip adnate	
to the produced foot of the column;	
side lobes of lip erect; foot of	
column long	
Spur saccate, laterally compressed; side	
lobes of lip 0; foot of column small. 17, Rhynchosty	
Spur conical, usually more or less	LIS.
alapartal areas on averal under the	
elongated, erect or curved under the	
midlobe of the lip; foot of column	
drge	
Column not prolonged into a root.	
Lip not spurred nor saccate.	
Leaves terete; flowers in short	
spikes : caudicle of pollinia	
broad 19. Luisia.	
Leaves lorate; flowers in racemes	
with very long simple or branched	
peduncles; caudicle of pollinia	
long, narrow 20, Cottonia.	
Lip spurred or saccate.	
Side lobes of lip large; flowers	
large	
Side lobes of the small or U.

Anther-cells sessile on the column, remote or contiguous, always discrete; pollinia 2, sometimes 2-partite, adnate with or without caudicles to separate glands; leaves membranous; terrestrial herbs.		
Sepals subequal and more or less connivent; petals equal to or shorter than the sepals	29.	Peristylus.
sprending. Stigmas sessile or subsessile, confluent or more		•
or less distinct	30.	PLATANTHERA.
Stigmns more or less distinctly stalked, very		
rarely confluent	31.	HABENARIA.

1. OBERONIA, Lindl.

Epiphytic herbs with usually very short often tufted stems. Leaves coriaceous or fleshy, usually ensiform, always distichous and equitant. Flowers minute, numerous, in dense subcylindric spikes or racemes, expanding centrifugally. Sepals ovate or oblong, subequal. Petals as wide as or narrower than the sepals. Lip larger than the sepals, sessile, more or less concave, usually lobed and often erose. Column very short, stout. Anther terminal or incumbent; pollinia 4, cohering in pairs, waxy.—Distrib. Species about 60, Tropical Asiatic, Australian, and Pacific.

Petals broad, ovate or obovate.		ř
Petals ovate; lateral lobes of lip small; midlobe 2-fid with		••
a broad sinus; flowers greenish-yellow	1.	O. Falconeri.
Petals obovate; lateral lobes of lip large, orbicular; midlobe		
2-fid with a narrow sinus; flowers brick-red	2.	O, recurva.
Petals linear	3.	O. Brunoniana.

1. Oberonia Falconeri, Hook. f. Icon. Pl. (1888) t. 1780. Leaves corinceous, broadly ensiform, acute, subfalcate, 1-2 by \(\frac{1}{4} - \frac{1}{2} \) in., the lower becoming gradually smaller. Scape terete, shorter than the leaves, robust; bracts numerous, ovate-lanceolate or oblong, serrulate, slightly shorter than the flowers. Flowers about \(\frac{1}{20} \) in. across, greenish-yellow, numerous, shortly pedicellate, in a dense raceme 3-5 in. long; rhachis stout. Sepals broadly ovate. Petals ovate, obtuse. Lip linear-oblong; side lobes small, rounded or tooth-like; midlobe 2-fid at the apex, the lobules narrow, parallel or incurved, subacute, with a subtruncate broad sinus. Capsules shortly pedicellate, deeply ribbed, \(\frac{1}{8} - \frac{1}{6} \) in long. Fl. B. I. v. 5, p. 678; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Prain, Beng. Pl. p. 1003; Gammie, in Journ. Bomb. Nat. v. 16, part 4 (1905) p. 564. Oberonia iridifolia, Wall. Cat. 1948 (1 and 3) in part (not of Lindl.).—Flowers: Sept.—Oct.

KONKAN: Law!, Woodrow!; Kalyan, Millard ex Gammic, -Distrib. India (Nepal Behar, Chota Nagpur, Dehra Dun, W. Peninsula).

2. Oberonia recurva, Lindl. in Bot. Reg. (1839) Misc. No. 8. A small plant $2-3\frac{1}{2}$ in. high to top of inflorescence. Leaves $1-1\frac{3}{4}$ in. long, thin, pale green, oblong-lanceolate, acuminate, nearly straight. Scape short, terete; bracts lanceolate, shorter than the flowers, entire or subcrenulate. Flowers $\frac{1}{30}$ in. across, hyaline, sparsely gland-dotted, pale brick-red, pedicellate, in slender dense-flowered racemes $1\frac{1}{2}-2\frac{1}{2}$ in. long. Sepals broadly triangular-ovate, obtuse. Petals obovate-oblong, obtuse,

irregularly toothed. Lip usually longer than the sepals, the margins crenate or erose; side lobes large, orbicular; midlobe obcordate, 2lobulate, with usually a narrow sinus. Capsules \(\frac{1}{2} \) in, long, ovoid or subobovoid, with elongate pedicels as long as the capsules. El. B. I. v. 5, p. 680; Dalz. & Gibs. p. 260; Trim. Fl. Ceyl. v. 4, p. 137; Hook. f. Icon. Pl. (1888) t. 1784 A; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Gammie, in Journ. Bomb. Nat. v. 16, part 4 (1905) p. 564. Oberonia setifera, Lindl. Fol. Orchid. [Oberonia] (1859) p. 3.—Flowers: Feb.-Apr.

Throughout the Ghats and Konkan, Gammie. Konkan: Law!, Dalzell! Deccan: Mahableshwar, Cooke!, Woodrow, H. M. Birdwood; Khandala, Law, 39!-DISTRIB. India (W. Peninsula).

3. Oberonia Brunoniana, Wight, Icon. v. 5 (1852) p. 3, t. 1622. A large and handsome species. Leaves elongate, 6-14 by $\frac{3}{4}$ - $1\frac{1}{4}$ in., linear-oblong, succulent, nearly as long as the inflorescence. Scapes 2-8 in. long, flattened, adnate to the upper leaf, 2-edged; adnate leaf 1-4 in. long, usually falcate at the apex, variable in position; bracts lanceolate, denticulate, acute. Flowers $\frac{1}{6}$ in. across, sessile, in dense stiff erect spikes 4-6 in. long, like a rat's tail (Hooker). Sepals ovate, subobtuse, reflexed, slightly longer than the petals, brown. Petals linear, subacute, quite entire, pale yellow. Lip brown, cordate at the base, with a concave disk, entire, constricted below the apex which is 2-lobed, sometimes with a small tooth between the lobes. Capsules $\frac{1}{5}$ in long, sessile or nearly so. Fl. B. I. v. 5, p. 681. This may possibly be the plant which Dalzell & Gibson (Bo. Fl. p. 260) term O. Lindleyana.

Konkan: Dalzell! Kanara: Kala nuddi, Ritchie, 1405!-Distrib. India (W. Peninsula), apparently endemic.

EXCLUDED SPECIES.

OBERONIA PLATICAULON, Wight, Icon. v. 5 (1852) p. 3, t. 1623. Leaves 6-10 by $\frac{1}{2}-\frac{3}{4}$ in., narrowly ensiform, straight, subacute. Scape very broad, flat, adnate to a leaf to the top and almost as broad as the leaf; bracts ovate, sheathing the sessile ovary, erose, obtuse. Flowers whitish or pale yellow, about $\frac{1}{2}$ in. across, in spikes 3-5 in. long with a stout rhachis. Petals narrow, linear, slightly shorter than the sepals. Lips broader than long; side lobes broad, rounded; midlobe 3-toothed, the central tooth the smallest. Capsules sessile or nearly so.

This plant does not appear to have been found in the Bombay Presidency. It scens to belong to the Pulney Hills. Graham does not mention the plant (nor in fact the genus) in his Catalogue, nor do Dalzell & Gibson include it in their 'Flora of Bombay.' Woodrow does not cite it, and Gammie says in his "Orchids of the Bombay Presidency" (Journ. Bomb. Nat. v. 16, p. 564) that he does not know the plant. There are in all 2 sheets in Herb. Kew., one from the Pulney Hills from Wight's Herbarium and one other (also from Wight's Herbarium) without flowers, on which is a ticket apparently written by Wight—"19. Parasite, rare. I do not know what it is"; and at the bottom of the sheet in pencil are the words "Bombay Graham." Thus the only evidence as to the occurrence of the plant in Bombay depends on a pencilled note which does not state that the plant was collected in Bombay, but merely sent from there by Graham.

2. MICROSTYLIS, Nutt. -

Terrestrial (rarely epiphytic) herbs, pseudobulbous or not. Leaves one or more, membranous, plicate, continuous with their sheaths. Flowers small, resupinate in terminal racemes. Sepals spreading or recurved, subequal. Petals as long as the sepals but narrower. Lip adnate to the base of the column, usually flat, the basal lobes large, sagittate, and produced upwards; or cup-shaped with small lobes or without basal lobes, the apex emarginate, 2-3-lobed, crose or entire. Column usually very short with 2 spreading arms; anther subterminal, 2-celled; pollinia 4, ovoid or obovoid, waxy.—Distrib. Species about 70, chiefly in Tropical Asia and America.

1. Microstylis versicolor, Lindl. Gen. & Sp. Orchid. (1830) p. 21 (not of Wight). Stem 3-6 in. high, slender or robust, stoloniferous, bearing numerous acute sheaths, base swollen or not. Leaves usually drying yellowish-brown, thinly membranous, petiolate, $2\frac{1}{3}$ -7 by 11-3 in., broadly ovate or elliptic, acute or acuminate, plaited, silvery or purplish beneath, 5-7-nerved, decurrent into a sheathing petiole 1-3 in. long, base usually unequal-sided. Scape with racemo 6-12 in. long; bracts lanceolate, deflexed, about as long as the flowers. Flowers fragrant, 1-1 in. broad, green, yellow, or purple, in slender racemes. Sepals broadly ovate, obtuse, concave, 1-nerved, the dorsal longest and narrowest. Petals narrowly linear, subobtuse. Lip broader than long, rounded, reniform or fan-shaped, pectinate. Column somewhat constricted in the middle, truncate; arms short or 0. Fruit & in. long, clavate-oblong, erect, shortly pedicellate. Jackson, Index Kewen. v. 3 (1895) p. 234. Microstylis Rheedei, Wight, Icon. v. 3 (1843-45) part 2, p. 9, t. 902. Hook. f. Fl. B. I. v. 5, p. 690; Dalz. & Gibs. p. 260 (exclud. syn.); Hook. f. Icon. Pl. t. 1832; Trim. Fl. Ceyl. v. 4, p. 141; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Prain, Beng. Pl. p. 1004; Gammie, in Journ. Bomb. Nat. v. 16, part 4 (1905) p. 565. Malaxis Rheedei, Heyne, ex Wall. Cat. (1828) sub n. 1939; Grah. Cat. p. 202.—Flowers: June-Aug.

Lindley's specific name versicolor is more than 13 years prior to

Wight's name Rheedei.

Common on the Ghats. Konkan: Law!, Stocks! Deccan: Khandala, Cooke!; Mahableshwar, Cooke!, Woodrow, H. M. Birdwood; Koina Valley below Mahableshwar, common, Cooke! Kanara: Law!—Distrib. India (Chota Nagpur, W. Peninsula); Ceylon.

3. LIPARIS, Rich.

Terrestrial or epiphytic herbs (terrestrial in the Bombay species), pseudobulbous or not. Leaves 1 or more, membranous or coriaceous, continuous with the sheath, or thickened and jointed at the base. Flowers small, in terminal racemes, resupinate or not. Sepals spreading or recurved, the margins usually revolute. Petals as long as the sepals, but much narrower. Lip adnate to the base of the column, usually broad, flat or deflexed from the middle, sometimes concave, often with calli near the base. Column elongate, often arched, usually winged near the apex and tumid or dilated and compressed at the base; anther terminal; pollinia 4.—Distrib. Species about 120, in temperate and tropical regions, most numerous in India.

1. Liparis nervosa, Lindl. Gen. & Sp. Orchid. (1830) p. 26. Terrestrial, 6-15 in. high. Pseudobulbs often present, ovoid. Stem 2-5 in. long, slightly bulbous at the base, bearing several sheaths. Leaves 2 or 3, alternate, sessile, sheathing, $2\frac{1}{2}$ -5 by $\frac{3}{4}$ - $1\frac{3}{4}$, elliptic-

lanceolate, acute, narrowed into the amplexicaul sheath, plicate; main nerves 5, with numerous slender parallel veins between. Scape angular. together with the raceme 4-8 in. long; bracts $\frac{1}{8}$ - $\frac{1}{3}$ in. long, lanceolate, acute, spreading (not deflexed), shorter than the twisted ovary. Flowers green, tinged with pink or yellow, in erect rigid racemes; rhachis angular, striate. Sepals 5-nerved; dorsal sepal $\frac{1}{4}$ by $\frac{1}{16}$ in., linear-lanceolate, obtusely pointed, with revolute margins; lateral sepals $\frac{1}{6}$ by $\frac{1}{5}$ in., falcate-oblong, recurved. Petals $\frac{1}{4}$ by $\frac{1}{20}$ in., linear, obtuse, with revolute margins, reflexed. Lip 1 in. long and as broad as long, cuneately obovate or subquadrate, often recurved from the middle, tip truncate or slightly obcordate with a minute apiculus, and with 2 calli at the base. Column incurved above the middle, with 2 small rounded wings. Fruit $\frac{1}{2}$ - $\frac{3}{4}$ in. long, clavate, very shortly pedicellate. Trim. Fl. Čeyl. v. 4, p. 145; Index Kewen. Suppl. 2 (1905) p. 106. *Liparis paradoxa*, Reichb. f. in Walp. Ann. v. 6 (1861) p. 218; Hook. f. Fl. B. I. v. 5, p. 697; King, in Ann. Roy. Bot. Gard. Calc. v. 8, p. 27, t. 34; Prain, Beng. Pl. p. 1005; ? Gammie, in Journ. Bomb. Nat. v. 16, part 4 (1905) p. 565. Liparis odorata, Lindl. Gen. & Sp. Orchid. (1830) p. 26. Malaxis nervosa, Sw. in Vet. Akad. Nya Handl. Stockh. v. 21 (1800) p. 235. Malaxis odorata, Willd. Sp. Pl. v. 4 (1805) p. 91; Grah. Cat. p. 202.—Flowers: July-Sept.

Rare. Konkan: Stocks!, Law! Kanara: Law! Gammie [Journ. Bomb. Nat. v. 16, part 4 (1905) p. 565] describes a plant very close to this which was collected by Mr. Spooner on the Belgaum and N. Kanara Ghâts, but the lateral sepals of that plant are described as being similar to the dorsal, which is not the case in the specimens of L. nervesa in Herb. Kew. collected by Stocks and Law.

Van. Dalzellii. More robust, with stems $\frac{2}{3}$ in. in diam., leaves 4-6 by $2\frac{1}{2}-2\frac{3}{4}$ in., and much larger flowers. Liparis Dalzellii (sp.), Hook. f. Fl. B. I. v. 5 (1890) p. 698: Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Gammie, in Journ. Bomb. Nat. v. 16, part 4 (1905) p. 565.

There is but 1 specimen in Herb. Kew. from the South Konkan supplied by Dalzell, and no one seems to have seen another. Woodrow merely cites the 'Flora of Brytish India,' and Gammie says he does not know the plant. Except its size, I can find no difference between the variety and the typical plant, and I conclude that the variety is merely an accidental luxuriant specimen grown under some peculiar conditions.

4. DENDROBIUM, Swartz,

Epiphytic herbs; pseudobulbs short and fleshy or elongated and stem-like, usually tufted. Leaves sessile, never plicate, bases sheathing. Flowers solitary or in fascicles or racemes, often large and showy. Sepals subequal, the latter obliquely adnate to the foot of the column and forming with it a sac or mentum (spur). Petals usually like the sepals. Lip sessile or clawed at the base, adnate to and incumbent on the foot of the column; side lobes embracing the column or spreading or 0; terminal lobe broad or narrow, flat, convex, concave or saccate, its disk sometimes lamellate. Column short, its foot long or short with usually a nectar-secreting depression or cavity at its extremity, the apex angled or 2-toothed; anther 2-celled; pollinia 4, equal in length, sometimes in free pairs but usually all slightly coherent, the 4 never all quite free, ovoid or oblong, slightly compressed, waxy.—Distrib. Species about 300, Tropical Asiatic, Australasian, and Polynesian.

Stems branched, the branches formed by chains of uninodal sessile or stipitate pseudobulbs. Leaf solitary, terminal, coriaccous, flat, peristent. Flowers 1-3 from the base of the leaf, medium-sized, white or pale, lasting only one day; mentum (spur) short; the edge of the lip plicate ... Pseudobulbs short, tufted, with 2 or 3 leaves; or stems elongate and leafy. Leaves narrow, membranous, deciduous or persistent. Flowers in slender terminal or

lateral racemes, small or medium-sized; mentum rather long, conical, incurved, or short and obtuse; lip often with a flat keel on the disk that terminates in a truncate crenate callus on the midlobe.

Stems simple or nearly so, often a small pseudobulb. Small plants with crowded ovoid psudobulbs; flowers small, in racemes from the top of the pseudobulb; petals not broader than the dorsal sopal.

Sepals and petals white; lip pink with dark-

Larger plants; stems tufted, 10-18 in. long; flowers in terminal and lateral racemes; petals broader than the dorsal senals.

Lateral sepals oblong; midlobe of lip subquadrate; flowers oream-colored Lateral sepals lanceolate, falcate; midlobe of

lip orate, acute; flowers white, often with a tinge of pink

Stems long, copiously branched; flowers small Stems elongate, stout or slender, cylindric, clavate or nodose. Leaves membranous or coriaceous, persistent or deciduous. Flowers usually large, in lateral pairs or fascicles or racemes (very rarely solitary), variously colored, white, yellow, or purple.

Mentum (spur) half as long as the dorsal sepal; lip longer than broad
Mentum less than half as long as the dorsal sepal;

lip as broad as long

7. D. macrostachyum.

8. D. crepidatum.

1. Dendrobium Macræi, Lindl. Gen. & Sp. Orchid. (1830) p. 75. Rhizome creeping, annulate, giving off pendulous smooth polished stems 2-3 ft. long, bearing at irregular intervals narrowly fusiform somewhat compressed shining pseudobulbs 2-21 in. long; internodes long, terete. Leaf terminal from the top of the pseudobulb, solitary, 4-8 by \(\frac{3}{4}-1 \) in, finear-oblong, obtuse, with numerous parallel slender veins. Flowers remaining open for a few hours only, 1-3 from near the base of a leaf, 3-1 in across, white, the lip and mentum yellow fin the Sikkim specimen figured in the Annals of the Royal Botanic Garden, Calcutta (l. c.), the side lobes of the lip are shown pale-pink speckled with red, the middle greenish-yellow]; bracts beneath the flower small, ovate, acute, sheathing. Sepals oblong-lanceolate, subacute, spreading. (spur) short, broad, conical. Petals narrower than the sepals, linearoblong, obtuse. Lip oblong-obovate in general outline, decurved about the middle, concave; side lobes oblong, obtuse, the disk between them with 2 fleshy crests; midlobe contracted and coarsely erose-crisped at its base, the terminal part expanded and the edges much plicate. Column short with a short foot; pollinia narrowly oblong. Fl. B. I. v. 5, p. 714; Dalz. & Gibs. p. 260; Trim. Fl. Ceyl. v. 4, p. 150; King, in Ann. Roy. Bot. Gard. Diccan: Mahableshwar, Cooke!; Koina Valley below Mahableshwar, where it forms large masses on the branches of trees, Cooke!, H. M. Birdwood. S. M. Country: Rámghát, on Jambul trees, Dalzell & Gibson. Kanara: Sampkhand (N. Kanara), Woodrow.—Distrib. India (Sikkim, Khasia Hills, Birma, W. Peninsula); Ceylon, Java.

2. Dendrobium microbolbon, A. Rich. in Ann. Sc. Nat. sér. 2, v. 15 (1841) p. 19, t. 8. A small epiphyte. Pseudobulbs small, $\frac{1}{2}$ in. long, ovoid, crowded, covered with a network of fibres formed by decaying membranous sheaths. Leaves usually 2 from the top of the pseudobulb, very soon falling, rather thick, 2-3 by $\frac{1}{4}$ - $\frac{3}{8}$ in., oblonglanceolate, acute. Flowers 4-10, in racemes 1-3 in. long (including the scape); bracts $\frac{1}{10}$ $\frac{1}{3}$ in. long, lanceolate; pedicels and overy together $\frac{1}{4}$ in. long in flower, slender. Sepals white; lateral sepals $\frac{1}{5}$ in. long by $\frac{1}{10}$ in. broad below the middle from where it is decurrent into the mentum, falcately tapering to a subacute point; dorsal sepal $\frac{1}{4}$ by $\frac{1}{12}$ in., lanceolate, obtuse, veined. Mentum (spur) stout, $\frac{1}{3}$ in. long, slightly curved. Petals white, $\frac{1}{4}$ by $\frac{1}{16}$ in., oblanceolate, obtuse. Lip pink with darker veins, $\frac{1}{4}$ in. long and as broad as long, suborbicular in outline, 3-lobed; side lobes small, subacute; midlobe about $\frac{1}{12}$ in. long, truncate or slightly emarginate, crenulate, the disk with a pair of fleshy keels each terminating in front in a short triangular point. Capsules large for the size of the plant, 1/4 in. long, broadly ellipsoid, smooth (not ribbed), on a slender pedicel 1/3 in. long. Fl. B. I. v. 5, p. 716; Dalz. & Gibs. p. 261; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Gammie, in Journ. Bomb. Nat. v. 16, part 4 (1905) p. 567. Dendrobium humile, Wight, Icon. v. 5, part 1 (1852) p. 5, t. 1643. D. crispum, Dalz. in Kew Journ. Bot. v. 4 (1852) p. 111.—Flowers: Dec.-Mar.

Konkan: Stocks!, Dalzell!; throughout the Gháts and Konkan, Gammic. Deccan: Mahableshwar, Cooke!, Fairbank ex H. M. Birdwood; Lanoli, Woodrow.—Distrib. India (W. Peninsula).

- 3. **Dendrobium Mabelæ,** Gammie, in Journ. Bomb. Nat. v. 16, part 4 (1905) p. 567. Pseudobulbs small, tufted, 2-jointed, ovoid, $\frac{1}{4}$ in. long, or as much as 4-jointed and $1\frac{1}{2}$ in. long, clothed with a network of fibres. Leaves 2, linear-oblong, reaching 3 in. long, moderately firm. Flowers 3-4 or more, in racemes which are longer than the leaves and arising between them; peduncle slender, bracteate at the base and towards the middle; pedicels including the ovary $\frac{1}{4}$ in. long. Sepals white; lateral sepals $\frac{1}{4}$ in. long from a broad base, subfalcate, acute; dorsal sepal rather more than $\frac{1}{4}$ in. long by $\frac{1}{10}$ in. broad, oblong-lanceolate. Petals white, as long as the dorsal sepal, linear-spathulate. Lip yellowish-green with faint rose-colored blotches and streaks (Gammie), hinged on the extremity of the foot of the column, sub-orbicular in outline, $\frac{1}{5}$ in. long; side lobes shallow, obtuse; midlobe suborbicular, $\frac{1}{10}$ in. in diam., fringed with thick white hairs; disk with a channelled ridge which is free and 2-lobed at the end and extending as far as the lateral lobes.—Flowers: Oct.—Dec.
- S. M. COUNTRY: Belgaum Gháts, Gammie; Castlerock, Bhiva!; Londa, Bhiva!—DISTRIB. India (W. Peninsula).

4. Dendrobium chlorops, Lindl. in Bot. Reg. (1844) Misc. p. 44. Stems tufted, 12-18 in. long, usually slender. Leaves on first year's shoots 2-4 by \(\frac{1}{4}-\frac{1}{2}\) in., lanceolate, acute, the second year's shoots leafless and flower-bearing. Flowers 3 in. in diam., with a primrose-like scent when first expanded, in lateral and terminal racemes 3-6 in. long; pedicels and ovary together reaching \frac{1}{2} in. long in flower, slender; bracts below the pedicels 1 in. long, ovate-lanceolate, acute. Sepals cream-colored; lateral sepals $\frac{1}{3}$ in. long by $\frac{1}{3}$ in. broad at the base, oblong-lanceolate, subacute; dorsal sepal $\frac{1}{3}$ in. long, less than $\frac{1}{5}$ in. broad, oblanceolate, obtuse. Mentum (spun) conical, $\frac{1}{3}$ in. long. Petals a by 1 in., cream-colored, obovate. Lip flat, rather more than 3 in. long; side lobes small, rounded, greenish; midlobe large, subquadrate, cream-colored; disk pubescent with a channelled ridge. Column greenish; anther white (Veitch). Fruit not seen. Fl. B. 1. v. 5, p. 719; Dalz. & Gibs. p. 261; Veitch, Man. Orchid. Pl. part 3 (1888) p. 27; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Gammie, in Journ. Bomb. Nat. v. 16, part 4 (1905) p. 568. Dendrobium barbatulum, Wight, Icon. t. 910 (not of Lindl.). Cymbidium ovatum, Willd. Sp. Pl. v. 4 (1805) p. 101; Grah. Cat. p. 203.—Flowers in the cold season.

Throughout the Gháts and Konkan towards the south, Gammie. Konkan: Stocks!, Law!; Konkan Gháts, Woodrow. Deccan: Mahableshwar, Cooke!, H. M. Birdwood; Phonda Ghát, Ritchie, 1410!—Distrib. India (W. Peninsula), apparently endemic.

5. Dendrobium barbatulum, Lindl. in Wall. Cat. (1828) 2013. Stems 10-15 in. long, swollen at the base, tapering towards the apex. Leaves 3-4 by ½ in., lanceolate, acute, deciduous. Flowers white, often suffused with pink, glistening when fresh, in lateral and terminal racemes 3-6 in. long (including the peduncle); pedicels together with the ovary in flower ½ in. long; bracts $\frac{1}{10} - \frac{1}{6}$ in. long, lanceolate, scarious. Lateral sepals $\frac{\alpha}{4}$ by $\frac{1}{6}$ in., lanceolate, acute, slightly falcate; dorsal sepal $\frac{\alpha}{4}$ by $\frac{1}{6}$ in., linear-lanceolate, acute. Mentum (spur) conical, acute, $\frac{1}{3}$ in. long. Petals $\frac{7}{6}$ by $\frac{1}{3}$ in. broadly lanceolate, acute. Lip $\frac{7}{6}$ in. long, obtuse; midlobe $\frac{5}{6}$ by $\frac{3}{6}$ in., rhomboid-obovate, apiculate, entire, bearded at the base with yellow hairs. Fruit $\frac{1}{4}$ in. long. Fl. B. I. v. 5, p. 719; Dalz. & Gibs. p. 261; Veitch, Man. Orchid. Pl. part 3 (1888) p. 21; Bot. Mag. t. 5918; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Gammie, in Journ. Bomb. Nat. v. 17, part 1 (1906) p. 31.—Flowers: Apr.-May. Vern. Jadhia-lasan.

Konkan: Stocks!, Law!, Graham; Matheran, Woodrow, H. M. Birdwood. Deccan: Mahableshwar, common, Cooke!—Distrib. India (W. Peninsula).

6. Dendrobium herbaceum, Lindl. in Bot. Reg. (1840) Misc. p. 69. A large pendulous epiphyte with much-branched stems 2-3 ft. long; lower part of stem naked and as well as the branches smooth, polished and shining, brown or yellow; branchlets leafy. Leaves $2-\frac{1}{2}$ by $\frac{1}{4}-\frac{3}{6}$ in., linear-lanceolate, neute or subobtuse, caducous. Flowers yellow; racemes terminal, few-flowered, rarely reaching 1 in. long; peduncle $\frac{1}{4}-\frac{1}{3}$ in. long; pedicels together with the ovary $\frac{1}{4}-\frac{1}{2}$ in. long, flifform; bracts $\frac{1}{12}-\frac{1}{5}$ in. long, lanceolate, scarious. Lateral sepals $\frac{1}{4}$ in. long by $\frac{1}{10}$ in. broad at the base, oblong-lanceolate, subacute, slightly falcate; dorsal sepal $\frac{1}{4}$ by $\frac{1}{12}$ in., oblong-lanceolate. Mentum (spur) minute, rounded. Petals $\frac{1}{6}$ by $\frac{1}{16}$ in., linear, obtuse. Lip $\frac{1}{6}$ by $\frac{1}{12}$ in., oblong, slightly constricted about $\frac{1}{10}$ in. from the apex; side lobes very

narrow or obsolete; midlobe ovate, subacute, entire. Fruit $\frac{3}{4}$ in. long, ellipsoid, tapering at the base into a stalk $\frac{1}{2}$ in. long, with 3 broad flat ribs and 3 narrow ones. Fl. B. I. v. 5, p. 719; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Prain, Beng. Pl. p. 1006; Gammie, in Journ. Bomb. Nat. v. 17, part 1 (1906) p. 32. Dendrobium ramosissimum, Wight, Icon. v. 5, part 1 (1852) p. 6, t. 1648; Dalz. & Gibs. p. 261.—Flowers: Nov.

Konkan: Gibson!, Dalzell!, Stocks! Decoan: Mahableshwar, Woodrow; Koina Valley below Mahableshwar, abundant, Cooke!, H. M. Birdwood; Wada below Mahableshwar, Cooke!—Distrib. India (Bengal, W. Peninsula).

7. Dendrobium macrostachyum, Lindl. Gen. & Sp. Orchid. (1830) p. 78. Stems many, pendulous, crowded, slender, terete, the leaf-bearing stems 8-20 in. long, the flowering stems longer, sometimes reaching 4 ft. long (Trimen). Leaves sessile, sheathing at the base, $2-3\frac{1}{2}$ by $\frac{1}{2}-\frac{7}{8}$ in., oblong-lanceolate, acute, membranous, the sheaths appressed to the stem. Flowers 2-4 from the leafless stems of the previous year's growth, fragrant, very pale green or yellow, often tinged with pink; peduncle short; pedicels with the ovary reaching 1 in. long, slender, often curved; bracts small, ovate, acute, scarious. sepals $\frac{1}{2}$ $\frac{5}{8}$ by $\frac{1}{8}$ $\frac{1}{6}$ in., oblong-lanceolate, acute; dorsal sepal similar. Mentum (spur) $\frac{1}{4}$ $\frac{1}{3}$ in long, funnel-shaped, obtuse. Petals $\frac{1}{2}$ $\frac{5}{8}$ by $\frac{1}{10}$ $\frac{1}{8}$ in., linear-lanceolate, acute. Lip \$ -3 in. long and less than 1 in. broad, with a long claw, ovate-oblong, finely pubescent, crenulate on the margin; side lobes small, rounded, often obscure; midlobe quadrately ovate, obtuse, yellow at the tip; disk veined with purple. Fruit $1-1\frac{1}{4}$ in. long, narrowly fusiform, tapering into the stalk. Fl. B. I. v. 5, p. 735; Wight, Icon. t. 1647; Trim. Fl. Ceyl. v. 4, p. 152; Prain, Beng. Pl. p. 1007; Gammie, in Journ. Bomb. Nat. v. 17, part 1 (1906) p. 32.-Flowers: May.

Konkan: S. Konkan, Dalzell, 45! Deccan: Koina Valley below Mahableshwar, Cooke! S. M. Country: Belgaum Gháts, Gammic. Kanara: Woodrow!, Gammic.—Distrib. India (Chota Nagpur, W. Peninsula); Ceylon.

8. **Dendrobium crepidatum,** Lindl. & Pawt. Fl. Gard. v. 1 (1850) p. 63, fig. 45. Stems tufted, almost as thick as the little finger, fleshy, loosely sheathed, 12–18 in. long, jointed at intervals of about 1 in., the internodes marked with longitudinal white lines on a sea-green ground. Leaves 2–5 by $\frac{1}{2}$ – $\frac{5}{8}$ in., linear-lanceolate, acute, falling at the end of the first season. Flowers in fascicles of two or three produced from every joint except the lowermost, of wax-like texture, white tinted with lilac except the disk which is yellow; pedicel together with the ovary reaching $1\frac{1}{4}$ in. long in flower, pale purple; bracts minute, ovate, acute. Lateral sepals $\frac{1}{2}$ by $\frac{1}{3}$ in., oblong-elliptic, rounded at the apex; dorsal sepal similar. Mentum (spur) $\frac{1}{3}$ in. long, obtuse. Petals $\frac{1}{2}$ by $\frac{1}{3}$ in., elliptic, rounded at the apex. Lip $\frac{1}{2}$ in. long and as broad as long, with a yellow disk and white tip, slightly retuse at the apex and with a short claw, plaited at each side at the base forming a slipper-like cavity. Fruit clavate, $1\frac{1}{2}$ –2 in. long. Fl. B. I. v. 5, p. 740; Bot. Mag. t. 4993 & t. 5011; Veitch, Man. Orchid. Pl. part 3 (1888) p. 33; Prain, Beng. Pl. p. 1007; Gammie, in Journ. Bomb. Nat. v. 17, part 1 (1906) p. 33. Dendrobium Lawanum, Lindl. in Journ. Linn. Soc. v. 3 (1859) p. 10;

Dalz. & Gibs. p. 260. Dendrochilum roscum, Dalz. in Kew Journ. Bot. v. 4 (1852) p. 291.—Flowers: Mar.-Apr.

Konran: Law!, Dalzell!, Stocks!; near Vingorla, Dalzell, 33! Diccan: Mahableshwar Hills, Cooke! S. M. Countay: Belgaum Gháts, Gammie, Kanara: Gammie,—Distair, India (Chota Nagpur, Assam, Khasia Mountains, W. Peninsula).

The following plants of the genus are sometimes grown in the Bombay Presidency:—

Dendrobium formosum, Roxb. in Wall. Cat. (1828) 1998. A native of the tropical Himalayas, Assam, the Khasia Hills, and Birma. Stems 12-18 in. long, cylindric, nearly as thick as the little finger. Leaves ovate-oblong, 5 in. long, amplexicaul, unequally 2-lobed at the apex. Flowers white, with an orange blotch on the lip, 3-4 in. in diam. Lip broadly obovate, entire. Fl. B. I. v. 5, p. 721; Veitch, Man. Orchid. Pl. part 3 (1888) p. 44; Bot. Reg. (1838) Misc. p. 49; Prain, Beng. Pl. p. 1006; Woodr. Gard. in Ind. ed. 5, p. 474.

Dendrobium albo-sanguineum, Lindl. & Paxt. Fl. Gard. v. 2 (1852) p. 93. A native of Birma. Stems subcylindric, 6-12 in. high and about ½ in. thick. Leaves linear-lanceolate, reaching 6 in. long. Flowers nearly 3 in. in diam., pale buff with maroon-purple blotches at the base of the lip. Lip with a broad claw and broadly obovate blade. Fl. B. I. v. 5, p. 722; Bot. Mag. t. 5130; Veitch, Man. Orchid. Pl. part 3 (1888) p. 16; Woodr. Gard. in Ind. ed. 5, p. 473.

Dendrobium cretaceum, Lindl. in Bot. Reg. (1847) t. 62. A native of Assam and the Khasia Hills. Stems stoutish, 9-12 in. long, curved. Leaves 2-3 in. long, oblong-lanceolate, deciduous. Flowers $1\frac{1}{2}$ in. in diam., cream - white. Lip elliptic - oblong, fimbriate - dentate; disk yellowish, streaked with crimson. Fl. B. I. v. 5, p. 736; Bot. Mag. t. 4686; Veitch, Man. Orchid. Pl. part 3 (1888) p. 33; Woodr. Gard. in Iud. ed. 5, p. 474.

Dendrobium heterocarpum, Wall. in Lindl. Gen. & Sp. Orchid. (1830) p. 78. A native of Nepal, Assam, Birma, Ceylon, Java, and the Philippines. Stems erect, stoutish, 9-18 in. high, yellow. Leaves 4-5 in. long, oblong-lanceolate, acute, deciduous. Flowers with a primrose fragrance, 2-2½ in. across. Sepals and petals cream-colored. Lip buff-yellow, streaked with reddish-purple; disk velvety. Fl. B. I. v. 5, p. 737; Trim. Fl. Ceyl. v. 4, p. 154. Dendrobium aureum, Lindl. Gen. & Sp. Orchid. (1830) p. 77; Bot. Reg. (1839) t. 20; Veitch, Man. Orchid. Pl. part 3 (1888) p. 19; Woodr. Gard. in Ind. ed. 5, p. 473.

Dendrobium Pierardi, Roxb. Hort. Beng. (1814) p. 63. A native of Sikkim and Bengal, where it is common in the Sundribans. Stems slender, pendulous, 2-3 ft. long. Leaves ovate-lanceolate, the lowermost 4-5 in. long, gradually smaller upwards, deciduous. Flowers 1-2 in across, usually in pairs: Sepals and petals pale rosy-mauve. Lip broadly deltoid, primrose-yellow, streaked with purple at the base. Fl B. I. v. 5, p. 738; Bot. Mag. t. 2584; Veitch, Man. Orchid. Pl. part & (1888) p. 69; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518, & Gard in Ind. ed. 5, p. 475; Prain, Beng. Pl. p. 1007. Cymbidium aphyllum Sw. in Nov. Act. Soc. Sc. Upsal. v. 6 (1799) p. 73; Grah. Cat. p. 203.

Dendrobium nobile, Lindl. Gen. & Sp. Orchid. (1830) p. 79. A native of the Eastern Himalayas, the Khasia Mountains, and China. Stems tufted, 12-20 in. or more long. Leaves 3-4 in. long, ovate-lanceolate, obliquely. emarginate. Flowers $2\frac{1}{2}$ -3 in. across, variable in color, odorous. Several varieties of this plant have been described. Fl. B. I. v. 5, p. 740; Bot. Reg. (1844) Misc. p. 48; Veitch, Man. Orchid. Pl. part 3 (1888) p. 63; Woodr. Gard. in Ind. ed. 5, p. 474.

Dendrobium Parishii, Reichb. f. in Bot. Zeit. (1863) p. 237. A native of Upper Birma and Tenasserim. Stems thick, 1 ft. or more long. Leaves 3-5 in. long, oblong-lanceolate, deciduous. Flowers usually rose-purple, 1½-2 in. in diam. Lip with 2 maroon blotches. Fl. B. I. v. 5, p. 740; Bot. Mag. t. 5488; Veitch, Man. Orchid. Pl. part 3 (1888) p. 68; Woodr. Gard. in Ind. ed. 5, p. 475.

Dendrobium aqueum, Lindl. in Bot. Reg. (1843) t. 54. A native of the Nilghiris. Stems 12–20 in. long, decumbent, stoutish, yellowish-green when young. Leaves 3–5 in. long, ovate-oblong, acute. Flowers solitary or in pairs, cream-white except a yellowish disk on the lip. Lip subrhomboid, obscurely 3-lobed. Fl. B. I. v. 5, p. 739; Bot. Mag. t. 4640. Dendrobium album, Wight, Icon. t. 1645; Veitch, Man. Orchid. Pl. part 3 (1888) p. 18; Woodr. Gard. in Ind. ed. 5, p. 473.

Dendrobium Dalhousieanum, Wall. MSS. in Paxt. Mag. v. 11 (1844) p. 145. A native of Sikkim, Assam, and Birma. Stems 3-4 ft. long, spotted with purple when young. Leaves 4-6 in. long, ovate-lanceolate, deciduous. Flowers 4-5 in. across, pale-yellow, veined and tinted with rose. Lip elliptic, concave, obscurely 3-lobed, with a large maroon-purple blotch on each side near the base. Fl. B. I. v. 5, p. 743; Veitch, Man. Orchid. Pl. part 3 (1888) p. 35; Woodr. Gard. in Ind. ed. 5, p. 474.

Dendrobium aggregatum, Roxb. Fl. Ind. v. 3 (1832) p. 477. A native of Assam, Birma, and China. Pseudobulbs clustered, reaching 2 in. long, 1-leaved. Flowers 1½ in. in diam., primrose-yellow when first expanded, changing in age to orange-yellow with a deeper color on the lip. Lip transversely oblong, with a short claw and pubescent disk. Fl. B. I. v. 5, p. 749; Bot. Mag. t. 3643; Veitch, Man. Orchid. Pl. part 3 (1888) p. 15; Woodr. Gard. in Ind. ed. 5, p. 472.

Dendrobium Farmeri, Paxt. Mag. v. 15 (1849) p. 241. A native of the tropical Eastern Himalayas, Assam, and Birma. Stems 10-18 in. long, clavate, 4-angled. Leaves 2-4, near the summit of the stems, 6 in. long, elliptic-oblong, persistent. Flowers 2 in. across, pale straw-yellow tinted with rose. Lip suborbicular; disk deep yellow. Fl. B. I. v. 5, p. 750; Bot. Mag. t. 4659; Veitch, Man. Orchid. Pl. part 3 (1888) p. 41; Woodr. Gard. in Ind. ed. 5, p. 474.

5. CIRRHOPETALUM, Lindl.

Epiphytic herbs with usually a creeping rhizome but sometimes tufted. Pseudobulbs 1 (rarely 2) -leaved. Leaves when solitary usually coriaceous and persistent, when geminate usually membranous and deciduous. Flowers in whorled umbels (in the Bombay species) on scapes rising from

the base of a pseudobulb. Lateral sepals usually much elongated and acuminate, oblique, often connate by their inner edges, their bases admate to the sides of the column or its foot; dorsal sepals short, concave, rarely half as long as the lateral, usually much shorter. Petals shorter than the dorsal sepal. Lip small, tunid, usually entire, always shorter than the dorsal sepal, jointed to the end of the foot of the column and more or less mobile. Column short with 2 (rarely 4) tooth-like appendages at the apex, the foot more or less produced. Anther 2-celled; pollinia 4, waxy, cohering in one mass and sometimes attached by their lower ends to a mass of viscid tissue, the 2 inner usually small and lamelliform.— Distrib. Species about 50, chiefly Indian and Malayan.

1. Cirrhopetalum fimbriatum, Lindl. in Bot. Reg. (1839) Misc. p. 72. Pseudobulbs clustered, ovoid, irregularly angular, smooth and polished, yellow and leafless when flowering, reaching 1 in. long. Leaves (from a specimen grown at Kew) 3-4 by $\frac{1}{2} - \frac{5}{8}$ in., oblong-lanceolate, acute. Scape from below the pseudobalbs, 4-8 in. long, slender, smooth, terete, with 2 or 3 lanceolate acute bract-like scales; flowers in umbels, nearly sessile, numerous; bracts $\frac{1}{6}$ in. long, lanceolate, acutely acuminate. Sepals green; lateral sepals 1-14 in. long, linear, acute, flat, cohering by their inner edges to near the tip, 5-nerved; dorsal sepal reaching in. long, ovate, suddenly tapering at the apex into a long subulate tail, 3-nerved. Petals 1 in. long, ovate, caudate, fringed with purple cilia, 1-nerved. Lip reddish-brown, fleshy, somewhat tongue-shaped, in long. Column with 2 subulate horizontal horns. Fl. B. I. v. 5, p. 774; Dalz. & Gibs. p. 261; Bot. Mag. t. 4391; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Gammie, in Journ. Bomb. Nat. v. 17, part 1 (1906) p. 34. Cirrhopetalum Wallichii, Grah. Cat. p. 205 (not of Lindl.) .- Flowers: Apr.-May.

Konran: Stocks!, Low!, Gammic. Deccan: Parghat below Mahableshwar, Low!, Graham; Rotunda Ghat, Mahableshwar, Graham; Koina Valley below Mahableshwar, Cooke!, Woodrow; Mahableshwar, H. M. Birdwood. S. M. Gourtus: Parva Ghat, Dalzell & Gibson. Kanara: Low!, Gammie; Supa Ghats of N. Kanara, Tulbot, 651 This orchid is known to Anglo-Indians as the Umbrella Orchis.—Disturn. India (W. Peninsula), apparently endemic.

6. BULBOPHYLLUM, Thouars.

Epiphytic herbs. Pseudobulbs from a creeping rhizome (rarely 0), 1 (rarely 2) -leaved. Flowers on scapes from the rhizome usually close to the pseudobulbs, racemose, spicate, capitate, umbellate or solitary. Sepals subequal or the lateral rather longer than the dorsal and free or connate under the lip. Petals usually smaller than the dorsal sepal. Lip articulate with the foot of the column, mobile, small, usually much recurved. Column very short, often 2-aristate at the apex. Anther 2-celled; pollinia 4, free, the 2 inner smaller (rarely obsolete).—Distrib. Species nearly 300, chiefly Asiatic, a few African, American, and Australian.

1. Bulbophyllum neilgherrense, Wight, Icon. v. 5, part 1 (1852) p. 6, t. 1650. Rhizome creeping. Pseudobulbs ovoid, $1\frac{1}{2}-2$ in. long, irregularly angled. Leaf 1 from the top of the pseudobulb, $3\frac{1}{2}-5\frac{1}{2}$ by $1-1\frac{1}{2}$ in., oblong, obtuse, often slightly emarginate, tapering at the base,

strongly many-nerved. Scape stout, from the base of the pseudobulb, sheathed at the base, jointed and with bract-like sheaths at the joints. Flowers in many-flowered racemes reaching with the scape sometimes 7 in. long; bracts $\frac{1}{4}$ in. long, lanceolate, acute; pedicel with ovary about as long as the bract when in flower. Sepals dull brownish-yellow, suffused with red at their bases; lateral sepals $\frac{3}{8}$ in. long, ovate-lanceolate, acute, oblique; dorsal sepal $\frac{1}{4}$ by $\frac{1}{6}$ in., broadly ovate, acute. Petals smaller than the dorsal sepal, ovate, acuminate, pale yellow. Lip 3-lobed, recurved; side lobes small, purple, entire or toothed; midlobe tongue-shaped, obtuse, brownish-yellow. Column with lanceolate spurs. Fl. B. I. v. 5, p. 761; Bot. Mag. t. 5050; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Gammie, in Journ. Bomb. Nat. v. 17, part 1 (1906) p. 33.—Flowers: Dec.

Not very common. S. M. Country: Belgaum Gháts, Gammie. Kanara: N. Kanara Gháts, Gammie; Sampkhand, Woodrow.—Distrib. India (W. Peninsula).

7. TRIAS, Lindl.

Small epiphytic pseudobulbous herbs. Leaves solitary on the pseudobulbs, coriaceous. Flowers solitary on lateral scapes. Sepals subequal, spreading, 7-nerved; lateral adnate to the foot of the column. Petals small, oblong or linear. Lip small, coriaceous or fleshy, jointed to the foot of the column, inflexed, incumbent, mobile. Column short, broad, the tip winged or toothed or angled. Anther erect, caducous, 2-celled, produced into a long horn; pollinia 4, waxy, subcoherent in pairs in each cell.—Distrib. Species 3 or 4, all Indian.

1. **Trias Stocksii**, Hook. f. Fl. B. I. v. 5 (1890) p. 781. A small epiphyte. Rhizome creeping. Pseudobulbs globosely ovoid, $\frac{3}{8} - \frac{3}{4}$ in. in diam. Leaves $\frac{3}{4} - 1\frac{1}{4}$ by $\frac{3}{8} - \frac{1}{2}$ in., elliptic-oblong, usually acute, sometimes apiculate, tapering at the base. Scape $\frac{1}{2}$ in. long. Flowers large for the size of the plant, $\frac{1}{2} - \frac{2}{3}$ in. in diam. Lateral sepals $\frac{1}{4}$ by $\frac{1}{6}$ in., oblong, obtuse; dorsal sepal $\frac{1}{6}$ by $\frac{1}{6}$ in., oblong, obtuse. Petals small, linear-lanceolate, acute, erect. Lip oblong, smooth, the shoulders convex, the tip rounded. Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518. Gammie, in Journ. Bomb. Nat. v. 17, part 1 (1906) p. 34.

Rare. Konkan: Law! Kanara; Stocks, 69!-Distrib. India (W. Peninsula).

8. PHOLIDOTA, Lindl.

Epiphytic herbs with jointed often branching stems, with internodes like pseudobulbs, or with tufted pseudobulbs. Leaves usually in pairs (solitary in *P. imbricata*, the only Bombay species), membranous, manynerved. Flowers small, subglobose, expanding from above downwards in racemes which are terminal or from the base of a pseudobulb, usually drooping and distichous; peduncles ebracteate; floral bracts large and persistent. Sepals concave. Petals narrower than the sepals Lip more or less cymbiform and saccate, usually without side lobes Column short, the apex shortly hooded or winged; anther more or less globose: pollinia 4, waxy, subglobose or clavate, cohering by pairs to one or two membranes.—Distrib. India, Ceylon, China, Malay Peninsula Australia; species about 20.

1. Pholidota imbricata, Lindl. in Hook, Fl. Evot. (1825) t. 138. A pendent epiphyte; pseudobulbs cospitose, cylindric, thickened at the base, 2-3 in long and $\frac{1}{2}$ - $\frac{3}{4}$ in thick at the middle, or shorter and more ovoid, furrowed, more or less enveloped in large fibrous sheaths. Leaf solitary, 6-12 by $1\frac{1}{4}$ - $2\frac{1}{3}$ in., elliptic-lanceolate or oblanceolate, acute. strongly 3-5-nerved, tapering at the base into a stout petiole 13 in. long. Flowers in dense many-flowered drooping racemes 6-9 in. long, rising from the top of the pseudobulb, distichous, 1 in. long, white with a pinkish or yellowish tinge (Trimen); peduncles slender, naked, as long as or longer than the raceme; floral bracts large, longer than the slender stalked ovary, persistent, pale brown, convolute, \frac{1}{3} in. broad, subrotund, minutely apiculate, many-nerved, the edges irregularly folded. Sepals 4 in. long; lateral sepals connate at the base, cymbiform with a winged keel: dorsal sepal orbicular, 3-nerved. Petals linear-oblong, subacute. Lip 3-lobed, saccate between the side lobes; side lobes large, broad, rounded; midlobe divided at the apex into 2 small oblong lobules separated by a broad sinus. Column broad and winged in its upper half; pollinia clavate, attached by pairs to two small membranes. Capsules 3 in, long, ellipsoid, strongly ribbed, the fruiting rhachis thickened. Fl. B. I. v. 5, p. 845; Dalz. & Gibs. p. 262; Wight, Icon. t. 907; Lindl. Bot. Reg. tt. 1213, 1777; Trim. Fl. Ceyl. v. 4, p. 162; King & Pantl. Ann. Roy. Bot. Gard. Calc. v. 8, p. 144, t. 201; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Prain. Beng. Pl. p. 1012.—Flowers: July.

Konkan: Stocks!, Law!; S. Konkan, Dalzell, 51!; near Vingorla rare, Dalzell & Gibson. Kanana: N. Kanara, Woodrow.—Distrib. India (Sikkim, Kumaon, Bhutan, Assam, Chittagong, Birma, Andaman Islands, W. Peninsula); Coylon, Malay Peninsula, China, Philippines.

9. JOSEPHIA, Wight.

Epiphytic almost stemless tufted herbs; root-fibres very stout. Leaves radical, petiolate, coriaceous, elliptic or oblong. Flowers small, pedicellate, in slender secundly branched panicles terminal or subterminal on the branches; bracts persistent, small. Sepals connivent, subequal, oblong, obtuse, concave, with a subsaccate base. Petals as long as the sepals, oblong, obtuse. Lip adnate to the base of the column, erect, fleshy, concave; side lobes short, rounded, incurved; midlobe small, rounded; disk with a broad callus uniting the side lobes. Column erect, nearly as long as the sepals, broad above, footless. Anther acuminate, 2-celled; pollinia 4, oblong, parallel, subcaudate, attached by a viscus to a broad gland.—Distrib. East Indies; species 2.

Wight says on the authority of Jerdon, who had the plants in cultivation for 3 years, that the flowers in the genus are annually renewed on the old scapes.

1. Josephia lanceolata, Wight, Icon. v. 5, part 1 (1852) p. 19, t. 1742 (leaves only; for flowers see t. 1743). Leaves including petioles 3-5½ by ½-1 in., oblong or oblong-lanceolate or oblanceolate, obtuse or subacute, apiculate, very coriaceous, dull green, strongly nerved, contracted at the base into a channelled petiole ½-2 in. long. Inflorescence very like that of a Statice; scapes exceeding the leaves, sometimes reaching 12 in. long; flowers white, tinged with purple; bracts small, ovate, acute, persistent; pedicel with the ovary short. Sepals ½-10 in.

long, obtuse, 3-nerved. Petals linear-oblong, obtuse, 1-nerved. Lip fleshy; side lobes small, rounded; midlobe subquadrate, rounded, somewhat saccate between the side lobes. Column purple. Fl. B. I. v. 5, p. 823; Trim. Fl. Ceyl. v. 4, p. 182; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518.

KANARA: Stocks, 50!, Law!

Wight's draftsman has transposed the figures of the inflorescence in the 'Icones,' giving the inflorescence of Josephia lanceolata to Josephia latifolia.

10. PORPAX, Lindl.

Small epiphytes with much depressed subdiscoid pseudobulbs clothed with reticulate sheaths. Leaves 2, membranous, caducous. Flowers 1-3, subsessile on the top of the pseudobulbs. Sepals connivent at the base, often all connate into a tube or the lateral only connate; lateral pair oblique at the base and adnate to the long-produced foot of the column. Petals small, free, usually shorter than the sepals. Lip sessile on the foot of the column and incumbent. Column short, wingless, its foot very long. Pollinia normally 8, pyriform or obovoid, attached by fours to a very short granular membrane.—Distrib. Species 6, all East Indian.

This genus, founded by Lindley in 1845 (Bot. Reg. Misc. p. 62), has been included under Eria by Bentham & Hooker f. [Gen. Pl. v. 3 (1883) p. 509], but has been again separated by King & Pantling [Orchids of the Sikkim Himalaya in Ann. Roy. Bot. Gard. Calc. v. 8 (1898) p. 113].

1. Porpax reticulata, Lindl. in Bot. Reg. v. 31 (1845) Misc. p. 62. Pseudobulbs button-like, \(\frac{3}{4}\) in. in diam., covered with lace-like sheaths. Leaves less than 1 in. long, broadly oblong. Flowers solitary, reaching \(\frac{1}{2}\) in. or more long, purple-brown, rising from between the leaves with sheaths and an orbicular bract at the base. Sepals all connate in a subcampanulate 3-lobed tube, strongly nerved on the inside; lobes broadly ovate, acute. Petals included in a sepaline tube, \(\frac{1}{3}\) by \(\frac{1}{16}\) \(\frac{1}{10}\) in., spathulate, strongly 5-nerved. Mentum (spur) obscure. Lip \(\frac{1}{6}\) in. long, panduriform, crenulate, shortly clawed, furnished at the base with an erect subulate tooth-like process. Pollinia 8, pyriform. Fruit not seen. Eria reticulata, Benth. in Gen. Pl. v. 3 (1883) p. 509; Hook. f. Fl. B. I. v. 5, p. 786; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Gammie, in Journ. Bomb. Nat. v. 17, part 1 (1906) p. 35. Aggeianthus marchantioides, Wight, Icon. v. 5, part 1 (1852) p. 18, t. 1737.—Flowers: June-July.

Thoughout the Western Gháts, but not easy to discover as the pseudobulbs are small and resemble the bark on which they rest. Kanara: Chandwar, Ritchie, 1415!

2. Porpax Lichenora, T. Cooke. Pseudobulbs depressed, disk-like, $\frac{1}{2} - \frac{3}{4}$ in. in diam., crowded, covered with a fibrous network. Leaves 2 on each pseudobulb, $\frac{1}{2} - 1\frac{1}{4}$ in. long, broadly ovate or orbicular, ciliate, brownish beautifully tessellated with green (Gammie). Flowers $\frac{1}{3}$ in. long, yellowish, 2-lipped; pedicels very short with a broad ciliate bract VOL. II.

and many subsimilar sheaths. Lateral sepals connate, pubescent, concave; dorsal sepal orbicular-ovate, 5-nerved (? free or connate with the lateral ones). Mentum (spur) small, rounded. Petals linearspathulate, much shorter than the sepals. Lip very small, shortly clawed, ovate-cordate, with toothed sides and an acute tip. Eria Lichenora, Lindl. in Journ. Linn. Soc. v. 3 (1858) p. 46; Hook, f. Fl. B. I. v. 5, p. 787; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Gammie, in Journ. Bomb. Nat. v. 17, part 1 (1906) p. 35. Lichenora Jerdoniana, Wight, Icon. v. 5, part 1 (1852) p. 18, t. 1738 (figure not good).—Flowers: July.

Konkan: Stocks!, Law! S. M. Country: Belgaum Ghats, Spooner ex Gammie. KANARA: Spooner ex Gammie; Sampkhand, Woodrow. Distrib. India (W.

Peninsula).

The plant requires the examination of fresh specimens. There is but one sheet in Herb. Kew., the specimens on which are imperfect. Wight says in his description (Icon. l.c.) that the sepals are adherent at the base, but this is not shown in his drawing, which is not good, his material, as he has explained, having been limited.

11. ERIA, Lindl.

Epiphytic usually pseudobulbous herbs; pseudobulbs often elongate and stem-like. Flowers never large, rarely showy, often pubescent or tomentose, in racemes, spikes, or heads on 1-2-flowered peduncles. Sepals free, adnate to the elongate foot of the column and forming with it a short or long and spur-like or saccate mentum. Petals like the sepals. Lip sessile on the foot of the column and incumbent. Column short and straight or long and little curved. Anther imperfectly 4- or 8-celled; pollinia waxy, pyriform or broadly obovoid, attached in fours by their bases to a granular membrane or occasionally all attached to a single viscus.—Distrib. Tropical Asia; species more than 100.

Flowers in racemes. Small plants less than 4 in, high; leaves less than 3 in. long; sepals and petals greenish-yellow. Margins of sepals entire; lip ovate-lanceolate 2. E. Dalzellii. Margins of sepals ciliate with minute gland-tipped hairs; lip pandurate
Plant exceeding 4 in. high; leaves 4-8 in. long; sepals 3. E. microchilos.

1. Eria reticosa, Wight, Icon. v. 5 (1852) p. 4, t. 1637. Caspitose, stemless; pseudobulbs $\frac{1-3}{2-4}$ in. in diam., enclosed in a net-like sac, depressed-globose. Leaves 2, oblong-lanceolate or elliptic-lanceolate, acute, 1-3 by $\frac{3}{8} - \frac{7}{8}$ in. Flowers solitary, large for the size of the plant, on slender scapes 1-13 in. long; bract below the flower large, 1 in. long and nearly as broad, ovate, acute, cordate, strongly nerved. Sepals pure white; lateral sepals reaching I in. long by I in. broad at the base, falcate, acute, 7-nerved; dorsal sepal nearly 1 in. long by I in. broad, oblonglanceolate, acute, 5-nerved. Mentum short, broad, sac-like. Petals white, as long as the lateral sepals, \frac{1}{4} in. broad, ohlong-lanceolate, acute, 5-nerved. Lip \(\frac{3}{4}\) in. long, 3-lobed; side lobes long, narrow, rounded, white edged with a purple line (Ritchie); midlobe $\frac{1}{4} - \frac{3}{8}$ in. long, ovate, acute, yellow at base and white towards the tip (Gammie), the margins subcrenulate; disk with 2 crested ridges. Column very short, yellow.

Capsules \(\frac{1}{2}\) in. long, obovoid, conspicuously and deeply ribbed. Fl. B. I. v. 5, p. 787; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Gammie, in Journ. Bomb. Nat. v. 17, part (1906) p. 36. Eria braccata. Dalz. & Gibs. Bo. Fl. p. 262 (not of Lindl.). Eria uniflora, Dalz. in Kew Journ, Bot. v. 4 (1852) p. 111.—Flowers: July.

KONKAN: Stocks!, Law!, Dalzell!, Woodrow; Western Ghats, Gammic. Deccan: Mahableshwar, Dalzell!, H. M. Birdwood; Lanoli, very common, Gammie. S. M. COUNTRY: Ramghat, Ritchie, 707! - DISTRIB. India (W. Peninsula).

2. Eria Dalzellii, Lindl. in Journ. Linn. Soc. v. 3 (1858) p. 47. A small plant 13-3 in. high (rarely more). Pseudobulbs flattened, ovoid, reaching \frac{1}{2} in. in diam., reticulated; principal venation pinnate (Gummie). Leaves usually 2, oblanceolate-oblong, obtuse. Flowers in racemes from between the leaves, secund, green with a yellow tinge; pedicels short; bract below the flower 1 in. long, lanceolate with a long acumen. Sepals lanceolate, acute, often recurved towards the apex; lateral sepals $\frac{1}{5}$ in. long; dorsal sepal $\frac{1}{4}$ in. long. Mentum (spur) broad, short, blunt, sac-like. Petals as long as the lateral sepals, lanceolate, acute. 1 by 1 in., rather thick, ovate-lanceolate, with 2 distinct callosities at the base; side lobes narrow, rounded, ½ the length of the lip; midlobe in. long, linear, acute, with a cronulate margin. Column nearly white (Gammie). Anther imperfectly 8-celled; pollinia 8, pyriform. Fl. B. I. v. 5, p. 789; Dalz. & Gibs. p. 262; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Gammie, in Journ. Bomb. Nat. v. 17, part 1 (1906) p. 36. Dendrobium filiforme, Wight, Icon. v. 5, part 1 (1852) p. 5, t. 1642.—Flowers: July.

Konkan: Stocks!, Law!, Dalzell!, Gammie; S. Konkan and Ghats, Dalzell & Gibson.—Distrib. India (W. Peninsula).

There is a marked difference between the lip of this orchid and the lip of Eria microchilos, Lindl., which it otherwise much resembles. The points of difference between the two plants have been clearly pointed out by Gammie (Journ. Bomb. Nat. l.c.). I have examined Lindley's own specimens in his Herbarium.

3. Eria microchilos, Lindl. in Journ. Linn. Soc. v. 3 (1858) p. 47. Pseudobulbs flattened, irregularly shaped, ½ in. in diam., reticulated; principal venation flabellate (Gammie). Leaves 2-4, oblong-lanceolate, obtuse, reaching 2 in. long. Flowers secund, in racemes rising from the base of the leaves; bracts $\frac{1}{10}$ in. long, ovate-lanceolate, acute. Sepals minutely ciliate with gland-tipped hairs; lateral sepals $\frac{1}{8}$ in. long, broadly lanceolate, acute; dorsal sepal \(\frac{1}{6}\) in. long, linear-lanceolate. Mentum (spur) $\frac{1}{12}$ in. long, curved forward. Petals $\frac{1}{6}$ by $\frac{1}{20}$ in., more or less ciliate with minute gland-tipped hairs. Lip $\frac{1}{10-8}$ in. long, thin, pandurate; side lobes small, rounded; midlobe broadly ovate, rounded and with subcrenulate margins; disk with almost obsolete ridges which coalesce in a single line towards the apex. Column green (Gammie); pollinia 8, pyriform, unequal. Dalz. & Gibs. p. 262; Gammie, in Journ. Bomb. Nat. v. 17, part 1 (1906) p. 36. Eria Dalzellii var. fimbriata, Hook. f. Fl. B. I. v. 5, p. 789. Dendrobium microchilos, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 345.—Flowers: July-Aug.

Konkan: Stocks!, Law!, Dalzell!, Gammie; Wari country on mango-trees, Dalzell & Gibson. Deccan: Mahableshwar. common. Cooks! Deccan: Yari (W. Peninsula).

The difference between the lip of this orchid and that of Eria Dalzellii is sufficient to justify its restoration to the rank of a species which is given to it by Lindley.

2 z 2

4. Eria mysorensis, Lindl. in Journ. Linn. Soc. v. 3 (1858) p. 54. Pseudobulbs ovoid, 2-3 in. long. Leaves 4-5, membranous, 4-8 by $\frac{3}{4}$ - $1\frac{1}{4}$ in., elliptic-lanceolate or oblong-lanceolate, acute, strongly and closely parallel-nerved. Flowers 6-12, in glabrous curved raceines which are shorter than the leaves, usually 2 racemes on each pseudobulb; pedicels $\frac{1}{4} - \frac{1}{2}$ in. long, filiform; bracts $\frac{1}{2} - \frac{5}{8}$ in. long, ovate-lanceolate, acute, glabrous, reflexed. Sepals white, strongly nerved; lateral sepals $\frac{1}{2}$ in. long by $\frac{1}{8}$ in. broad at the base, falcate, acute; dorsal sepal $\frac{1}{2}$ by in., linear-lanceolate, acute. Mentum (spur) very small, obtuse, sac-like. Petals white, rather shorter than the dorsal sepal, $\frac{1}{10}$ in. broad, lanceolate, acute, strongly 3-nerved. Lip \(\frac{1}{3} \) by \(\frac{1}{10} \) in., oblong or subpandurate, with a short claw, subcordate at the base; side lobes narrow, rounded, purple (Gammie); midlobe about \frac{1}{2} in. long, yellow (Gammie), apiculate, the side nerves usually forming arched thickened ridges. Fl. B. I. v. 5, p. 793; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518; Gammie, in Journ. Bomb. Nat. v. 17, part 1 (1906) p. 37.—Flowers: July.

Konkan: Stocks!; Western Ghats, Gammic. Decean: Koinn Valley below Mahableshwar, Cooke!, Woodrow, H. M. Birdwood; Mahableshwar, Gammic. S. M. Country: Dharwar, Law!—Distrin. India (W. Peninsula).

12. THUNIA, Reichb.

Terrestrial or epiphytic herbs; stems slender or equally thickened along their entire length, elongate, leafy, with numerous foliaceous sheaths below. Leaves distinhous, lanceolate, glaucous. Flowers in terminal drooping racemes; bracts large, scarious. Sepals erecto-patent, subequal, lanceolate, acute. Petals like the sepals. Lip adnate to the base of the footless column, shortly spurred; side lobes short, involving the column; midlobe fringed. Anther narrow, pendulous, incompletely 4-celled; pollinia 8, waxy, attached in fours to a granular membrane; rostellum 3-lobed.—Distrib. Species 5 or 6, East Indian.

1. Thunia venosa, Rolfe, in Orchid. Rev. v. 13 (1905) p. 206. Epiphytic. Flowers in terminal congested racemes. There is one specimen of this orchid from the Bombay Presidency in Herb. Kew. collected by Dalzell in 1869 on the east side of Matheran Hill and which Dalzell described as a new Dendrobium. I subjoin Dalzell's description literatim from his manuscript in Herb. Kew.:—

"Stem 1-1½ ft. high. Leaves sheathing, alternate, bifarious, their sheaths entire, 1 in. long; leaves gradually larger upwards, 3-7 in. long. Flowers terminal, 3-4, each subtended by a pale green foliaceous persistent bract nearly 2 inches in length. Sepals and petals alike, pure white, linear-lanceolate, acute, erect in flowering and spreading like a fan, all on one side and furthest from the axis, the lip being inner and opposed. Labellum ½ in., shorter than the sepals and petals, somewhat trumpet-shaped, the lower parts of the margin meeting. Throat of the labellum with 5 parallel rugged ridges; edges of labellum lacerato-fimbriate, the inside painted throughout with veins of a carmine colour. Spur half the length of the ovary, decidedly short, cylindrical. Column rather long, expanded upwards into wings, semicucullate above, white, shaped like the hood of a cobra. Lip not articulated with the spur, which merely forms the tubular base of the labellum. Flowers in the

rainy season (August). Very unlike Dendrobium chlorops and D. barbatulum in habit, as the leaves and flowers of this plant appear together, but in the cold and hot seasons it is scarcely distinguishable from them except by the somewhat larger fruit. Appears to come nearest in habit and appearance to D. formosum, Roxb., figured in Wall. Pl. As. Rar. t. 39. This is by far the handsomest orchid in the Bombay Presidency." Phajus albus, Bot. Reg. (1838) t. 33 (not of Lindl.); Bot. Mag. t. 3991; Grah. Cat. p. 205; Hook. f. Fl. B. I. v. 5, p. 818 in part; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 518.—Flowers: July-Aug.

Rare. Konkan: Matheran Hill eastern side, Dalzell! Deccan: on trees at Khandula, Graham; Mahableshwar, Fairbank ex H. M. Birdwood; Lanoli, Woodrow. King and Pantling (Ann. Roy. Bot. Gard. Calc. v. 8, p. 111) mention, as-occurring in Sikkim, a small and epiphytal form of Phajus albus with a shorter congested raceme and not ascending beyond 3000 ft., which would seem to be this.—DISTRIB. India (Kumaon, Sikkim, Assam, Khasia, Mussoorie, Birma, W. Peninsula).

13. EULOPHIA, R. Br.

Terrestrial glabrous herbs with fleshy tubers or rhizomes (rarely pseudobulbous). Leaves appearing with or after the flowers, long, narrow, usually plicate. Flowers racemose, rarely paniculate, on a tall erect sheathed usually lateral scape. Sepals free, spreading, subequal. Petals subsimilar. Lip adnate to the base of the column or to its foot, base saccate or with a short spur; side lobes erect and embracing the column (rarely 0); midlobe spreading or recurved; disk usually ridged or crested. Column with or without a foot, its apex entire and often oblique, the margins sometimes winged or lobed; anther terminal, sometimes with 2 apical processes, 2-celled; pollinia 2, globose, attached by a caudicle to the flat gland of the rostellum.—Distrib. Tropical, numerous in Africa; species about 50.

Column not produced into a foot,

Lip longer than broad; side lobes of lip short or 0; disk of lip

1. Eulophia ochreata, Lindl. in Journ. Linn. Soc. v. 3 (1858) p. 24. Roots tuberous, hypogeal. Leaves 3-5, elliptic-lanceolate, acuminate, 4-12 by $1\frac{1}{2}-2\frac{1}{2}$ in., many-nerved, sessile. Flowers membranous in all their parts, in dense many-flowered cylindric racemes 4-6 in. long; scape 8-12 in. long, stout below, furnished with broad loose ochreate sheaths; bracts beneath the flowers $\frac{1}{3}-\frac{1}{2}$ in. long, conspicuous, narrow, linear-lanceolate, acute; pedicels with ovary $\frac{1}{2}$ in. long. Sepals $\frac{1}{2}$ in. long, linear-lanceolate, acute, strongly nerved. Petals $\frac{3}{8}$ in. long, broadly elliptic, acute, strongly nerved. Spur a small hemispheric sac. Lip $\frac{3}{8}$ in. long, broadly ovate, obtuse; side lobes 0; nerves all fringed. Fl. B. I. v. 6, p. 2; Dalz. & Gibs. p. 265.

Konkan: Stocks!, Law!, Dalzell & Gibson. S. M. Country: Dharwar, Law! Kanara: Law!—Distrib. India (W. Peninsula), apparently endemic.

2. Eulophia herbacea, Lindl. Gen. & Sp. Orchid. (1833) p. 182. Stem 4-6 in. long, sheathed. Leaves 6-12 in. long, varying in breadth from 1-3; in., linear-lanceolate or elliptic lanceolate, many-nerved.

Flowers large, in rather lax racemes; scape stout, 2-3 ft. high, with large acuminate sheaths; bracts beneath the pedicels reaching 1^{α}_{1} in. long, linear-lanceolate, acuminate; pedicels with ovary $\frac{\alpha}{4}-1$ in. long. Sepals green, $\frac{7}{8}-1^{\frac{1}{4}}$ by $\frac{1}{6}$ in., linear-lanceolate. Mentum $(spur)^{\frac{1}{6}}$ in. long, slender, terete, obtuse. Petals white, $\frac{1}{2}-\frac{5}{8}$ by $\frac{1}{4}-\frac{5}{8}$ in., oblong-elliptic, obtuse or subacute, with numerous strong branched purple nerves. Lip $\frac{3}{4}$ in. long; side lobes $\frac{1}{6}$ in. long, rounded; midobe $\frac{3}{6}-\frac{1}{4}$ in. long, oblong or obovate-oblong, obtuse, apiculate, white, with many fringed yellow nerves. Column $\frac{1}{4}$ in. high, not produced into a foot. Capsules $1\frac{1}{2}-1\frac{3}{4}$ in. long, ellipsoid, faintly ribbed. Fl. B. I. v. 6, p. 2; Dalz. & Gibs. p. 265; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519; Watt, Diet. Econ. Prod. v. 3, p. 291. Eulophia bicolor, Lindl. in Journ. Linn. Soc. v. 3 (1858) p. 24 (not of Dalzell). Eulophia carinata, Grah. Cat. p. 202 (not of Lindl.).—Flowers: July.

Konhan: Stocks!, Law!, Dalzell!, Dalzell & Gibson. Kanana: Law! Gujarat: Panch Mahals near Dohad, Raoji!; Khodya, Raoji!—Distrib. India (W. Himalaya, W. Peninsula).

3. Eulophia pratensis, Lindl. in Journ. Linn. Soc. v. 3 (1858) p. 25. Leaves appearing after the flowers; hence Lindley and Dalzell describe the plant as leafless. Leaves petiolate, reaching 12 in. long. in breadth varying from \(\frac{1}{2}-1\frac{1}{2}\) in., oblong-lanceolate, acute, strongly nerved, tapering at the base into a long sheathing petiole. Flowers yellow, in lax racemes; scape 1-3 ft. long, with appressed acute sheaths; bracts beneath the pedicels $\frac{3}{8}$ in, long, ovate-lanceolate, acuminate, membranous; pedicels with ovary $\frac{1}{4} - \frac{b}{8}$ in. long. Sepals elliptic-oblong, obtuse, subfleshy, 5-nerved; lateral sepals $\frac{1}{2}$ by $\frac{1}{4}$ in.; dorsal sepal slightly longer and slightly narrower than the lateral ones. Mentum (spur) in long, conical from a broad base, subacute. Petals shorter and broader than the dorsal sepal, elliptic-oblong, obtuse. Lip in long, $\frac{5}{6}$ in. broad across the side lobes when spread out; side lobes large, in. long, oblong, rounded; midlobe $\frac{1}{6}$ in. long, broadly ovate or suborbicular, obtuse; disk with 3 crested nerves. Capsules 11 in. long, ellipsoid, turgid. Fl. B. I. v. 6, p. 4; Dalz. & Gibs. p. 264; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519. Eulophia ramentacea, Wight, Icon. v. 5, part 1 (1852) p. 8, t. 1666 (not of Lindl.). E. virens, Grah. Cat. p. 202 (not of Brown).—Flowers: Nov.-Feb. VERN. Satavari.

Decean: Stocks, 22!; pasture-lands, Dalzell & Gibson; Páshan 6 míles west of Poona, Tukaram!; Poona, Woodrow, 965!; Panchgani, A. St. J. Cooke! S. M. Country: Belgaum, Ritchie, 1421!—Distrib. India (W. Peninsula), apparently endemic.

4. Eulophia nuda, Lindl. in Wall. Cat. (1828) 7371. Root tuberous, like a small potato, spherical, smooth. Leaves from the sides of the tuber (forming by their sheaths a short pseudo-stem), 10-14 in. long, variable in brendth, elliptic-lanceolate, acute, plicate, narrowed into the long tubular sheath. Flowers 9-20, in lax racemes from the base of the pseudo-stem; scape $1\frac{1}{2}-2$ ft. long, erect, stiff, with a few wide sheaths at the base and some scattered upwards; bracts beneath the flowers $\frac{1}{4}-\frac{3}{4}$ in. long, lanceolate, acute; pedicels with ovary $\frac{3}{4}-1\frac{1}{4}$ in. long. Sepals greenish-purple, linear-oblong, acute, 7-nerved; lateral sepals $\frac{7}{4}$ by $\frac{1}{6}$ in., inserted on the spur of the lip, slightly falcate; dorsal sepal $\frac{7}{6}$ by $\frac{1}{6}$ in. Mentum (spur) very short, conical, obtuse, purplish-green. Petals white, $\frac{5}{6}$ by $\frac{1}{4}$ in., oblong, obtuse, many-nerved.

Lip $\frac{7}{8}$ in long by $\frac{5}{8}$ in broad across the side lobes, white or yellow flushed with pink or purple; side lobes short, rounded; midlobe ½ in. long, obovate oblong, obtuse, crimped; disk with about 9 strong nerves. Column short with a long foot. Capsules 11 in. long, fusiform, conspicuously ribbed; pedicels of capsules very short. Fl. B. I. v. 6, p. 5; King & Pantl. in Ann. Roy. Bot. Gard. Calc. v. 8 (1898) p. 180, t. 243; Trim. Fl. Ceyl. v. 4, p. 177; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519; Prain, Beng. Pl. p. 1016. Eulophia bicolor, Dalz. in Kew Journ. Kew. of G purpurcum (Limodorum nutans, Roxb.), derived probably from Roxburgh's

2. Sarcochilus maculatus, Benth. in Benth. & Hook. f. Gen. Pl. v. 3 (1883) p. 575. Almost stemless. Leaves 4-7 by 14-13 in., linearoblong, narrowed towards the base, obliquely emarginate at the apex. Flowers in erect elongate simple racemes much longer than the leaves. many-flowered from the base; pedicels very short; bracts 1 in. long, ovate, acute. Sepals yellow with a purple spot in the centre (Dalzell); lateral sepals \(\frac{1}{4}\) by \(\frac{1}{6}\) in., obovate; dorsal sepal very slightly longer than the lateral ones, obovate. Petals yellow with a purple spot in the centre (Dalzell), as long as the dorsal sepal, & in. wide. Lip painted with white and rose-color (Dalzell); side lobes $\frac{1}{10}$ in. long, erect, acute from a triangular base; midlobe $\frac{1}{8}$ by $\frac{1}{0}$ in., resembling (as described by Dalzell) a shoe with the front leather turned backward and like a side-saddle. with membranous margins, 3-lobed at the apex, the central lobe rounded: spur short, obtuse, continuous with the foot of the column, pointing forwards, hairy within. Capsules 11 in. long, nearly sessile, ellipsoid, 6-ribbed. Saccolabium maculatum, Hook. f. Fl. B. I. v. 6 (1890) p. 64; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519. Micropera maculata, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 282; Lindl. in Journ. Linn. Soc. v. 3 (1858) p. 38; Dalz. & Gibs. p. 263.—Flowers: May.

Konran: Western Gháts, Dalzell! Drecan: Phonda Ghát, Ritchie, 1427! Kanara: 6 miles west of Divimana, Woodrow.—Distrib. India (W. Peninsula).

17. RHYNCHOSTYLIS, Blume.

Epiphytic herbs without pseudobulbs; stem elongate, stout, leafy. Leaves very coriaceous, linear-oblong, truncately or bluntly 2-lobed at the apex. Flowers in long pendulous many-flowered cylindric racemes, showy. Sepals spreading, broad, obtuse. Petals narrower than the sepals. Lip adnate to the short foot of the column, the hypochile forming a deep wide pubescent sac without side lobes, the epichile obovate, acute, concave, with erect margins. Column short, stout, dilated at the base, and with a very short foot; stigma small; anther terminal, rounded; pollinia 2, elliptic, attached by a slender long caudicle to a small oblong gland.—Distrib. Species 2 or 3, Indian and Malayan.

1. Rhynchostylis retusa, Blume, Bijdr. (1825) p. 286, t. 49. Stems 3-8 in. long, as thick as the middle finger, clothed with the sheaths of decayed leaves, emitting many stout branching roots 6-10 in. long and as thick as a swan's quill; internodes short. Leaves 6-18 by ½-1½ in., loriform, spreading and recurved, denticulate-truncate, obliquely premorse or bluntly unequally 2-lobed at the apex, one lobe truncate, the other rounded. Flowers handsome, in dense cylindric racemes which are longer than the leaves, pale pink dotted with deeper colored spots, the lip deeper pink; peduncles short, with a few small scattered sheaths; bracts $\frac{1}{10} - \frac{1}{8}$ in. long, ovate, acute, persistent; pedicels with ovary $\frac{1}{4} - \frac{1}{2}$ in. Sepals veined; lateral sepals 3 by 4 in., somewhat obliquely obovate-orbicular; dorsal sepal \(\frac{1}{3} \) by \(\frac{1}{6} \) in., obovate, rounded at the apex. Petals as long as the sepals, & in. wide, elliptic-oblong, subobtuse. Lip dark pink, clawed, with a saccate flattened spur (hypochile) in. deep, the portion in front of the spur (epichile) 1/3 in. long, the basal part of which is oblong or cuneate-oblong, 10 in. wide, the apical part widening into a broad rounded retuse midlobe 1 in. wide. Capsules clavate,

1-1½ in. long, acutely 3-angled and 6-ribbed, on a short stout pedicel. Fl. B. I. v. 6, p. 32; King & Pantling, in Ann. Roy. Bot. Gard. Calc. v. 8 (1898) p. 213, t. 284; Trim. Fl. Ceyl. v. 4, p. 187; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519; Prain, Beng. Pl. p. 1020. Saccolabium guttatum, Lindl. in Wall. Cat. (1828) 7308; Dalz. & Gibs. p. 263; Wight, Icon, tt. 1745-46; Bot. Mag. t. 4108. Ærides retusum, Sw. in Schrad. Journ. v. 2 (1799) p. 233; Grah. Cat. p. 204.—Flowers: May.

Konkan: Stocks!, Law!, Dalzell!, Woodrow; Salsette, Dalzell & Gibson. Kanara': Kála naddi, Ritchie!—Distrib. India (Sikkim; base of Himalaya, Gharwal to Bhotan, Assam, Khasia Hills, Birma, W. Peninsula); Ceylon, Malayan Archipelago.

18. ÆRIDES, Lour.

Epiphytic herbs with leafly stems; pseudobulbs 0. Leaves coriaceous, linear or terete. Flowers usually numerous and showy, in dense or lax, decurved racemes, sometimes solitary; floral bracts minute. Sepals broad, spreading; lateral sepals adnate to the base or foot of the column. Petals like the sepals. Lip adnate to the column, spurred; side lobes large, or small or 0; midlobe longer than the side lobes or smaller and incurved between them. Column short with a short or long foot; anther 2-celled, with or without a beak; pollinia 2, globose, sulcate; caudicle long or short; gland various.—Distrib. Species about 50, Eastern Asiatic.

Lip horizontal or inflexed.

Flowers almost inodorous; lateral sepals \(\frac{2}{3} \) in. long, obovate; petals rose-colored, speckled with dots of a deeper color; midlobe of lip quadrate-oblong

Flowers sweetly fragrant; lateral sepals \(\frac{2}{3} \) in. long, obliquely oblong; petals pinkish-white, not speckled; midlobe of lip ovate.

Lip deflexed; lateral sepals 1 in. long, elliptic or suborbicular.

- 1. Æ. maculosum.
- 2. Æ. crispum. 3. Æ. radicosum.
- 1. Ærides maculosum, Lindl. in Bot. Reg. (1845) t. 58. Stems 1-3 in. long, stout, with many sheaths and numerous long tough roots as thick as a goose-quill, which are dry and shrivelled in the hot and cold seasons, thickening and becoming succulent during the rainy season. Leaves 6-9 by $\frac{5}{8}$ - $\frac{7}{8}$ in., linear-oblong, channelled, unequally 2-lobed at the apex. Flowers almost inodorous, in racemes 4-10 in. long, which are usually paniculately branched; peduncles green, $1\frac{1}{2}$ -3 in. long, with a few appressed acute sheaths; pedicels with ovary $\frac{1}{2}$ - $\frac{5}{8}$ in. long, rosecolored; bracts minute, ovate, acute. Sepals pale rose-colored; lateral sepals & in. long or a little longer, nearly as broad as long, obovate, sometimes slightly apiculate, somewhat gibbous, nerved; dorsal sepal as long as the lateral, rather narrower, obovate. Petals as long as the sepals, \frac{1}{5} in. broad, oblong, obtuse, slightly gibbous, rose-colored, speckled with minute dots of a deeper color. Lip exceeding $\frac{1}{2}$ in. long and nearly $\frac{1}{2}$ in. broad; side lobes rounded, crenulate; midlobe $\frac{1}{4}$ in. long and as broad as long, quadrate-oblong, rounded and retuse at the apex, of a dark rose-color in the centre, shaded off towards the slightly crisped margins; spur rather large, incurved like a hook. Capsules 3-1 in. long, ellipsoid or obovoid, with 3 deep acute ribs. Fl. B. I. v. 6, p. 45; Dalz. & Gibs. p. 266; Woodr. in Journ. Bomb. Nat. v. 12

(1899) p. 519; Prain, Beng. Pl. p. 1020. Saccolabium speciosum, Wight, Icon. v. 5, part 1 (1852) p. 9, tt. 1674-75.—Flowers: May.

Konkan: Stocks!, Law!, Dalzdl, 75! Deccan: Mahableshwar, Cooke!, Woodrow; Panchgani, Cooke! S. M. Countan: Belgaum, west face of Cheeta Hill, Ritchie, 713!
—Distrin. India (Chota Nagpur (rare), W. Peninsula).

2. Ærides crispum, Lindl. in Wall. Cat. (1828) 7319. Stem 4-10 in. long, very stout, clothed with sheaths of decayed leaves; roots long and slender, clasping the tree closely, dry and shrivelled in the dry, thickening and becoming succulent during the rainy season. Leaves 4-8 by $1\frac{1}{4}-1\frac{3}{4}$ in., oblong or lorate, thickly corraceous, unequally 2-lobed at the apex, channelled, smooth, curved. Flowers sweetly fragrant, in long often paniculately branched racemes 5-12 in. long; peduncles green, 4-8 in. long, with a few acute appressed sheaths; pedicels with ovary $\frac{1}{3} - \frac{3}{4}$ in. long, pale pink; bracts small, ovate, acute. Sepals pinkishwhite; lateral sepals & by ½ in., obliquely oblong, roundish, acute at the apex; dorsal sepal ½ by ¾ in., obovate, obtuse, often slightly apiculate. Petals & by & in., broadly obovate, pinkish-white, shaded with darker pink. Lip 1 in. long, geniculately inflexed at the claw; side lobes small, oblique, straight on the lower, elliptic on the upper margin, marked with pink lines; midlobe exceeding 1 in. long, ovate, subobtuse, somewhat 3-lobed, with reflexed and crenulate margins, darker in color than the lateral lobes, with 2 fleshy calli at the base which close the mouth of the spur; spur short, incurved, its apex often concealed beneath the reflexed edges of the lower lip. Column with a purple ring over each of the 2 pollinia. Capsules 1-1; in. long, pyriform, deeply ribbed. Fl. B. I. v. 6, p. 45; Dalz. & Gibs. p. 265; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519. Ærides Lindleyana, Wight, Icon. v. 5 (1852) p. 9, t. 1677; Dalz. & Gibs. p. 265.—Flowers: Apr.-May.

KONRAN: near Vingorla, Dalzell & Gibson; Wari country, Dalzell & Gibson, Decoan: Mahableshwar, very common, Cooke!, Woodrow, H. M. Birdwood. Kanara: Usheli, Ritchie, 713!—Distrib, India (W. Peniusula).

3. Ærides radicosum, A. Rich. in Ann. Sc. Nat. ser. 2, v. 15 (1841) p. 65, t. 1, fig. C. Stem 1½-4 in. long, as thick as the thumb, covered with sheaths of decayed leaves. Leaves corinceous, 4-10 by $\frac{3}{4}$ -1 in., linear-oblong, unequally 2-lobed at the apex, often mottled with purple. Flowers deep rose-colored, in stout racemes or panicles rarely exceeding the leaves; peduncles 2-3 in. long, stout; bracts $\frac{1}{10}$ in. long, ovate, acute; pedicels with ovary 1-1 in. long. Sepals 5-nerved; lateral sepals 1 in. long and as broad as long, broadly elliptic or suborbicular; dorsal sepal 4 by 1 m., elliptic, obtuse. Petals as long as and slightly narrower than the lateral sepals, broadly elliptic, obtuse, Lip deflexed, longer than the sepals; side lobes minute; midlobe ovate; disk with 2 large basal calli; spur cylindric, obtuse, in-Anther beaked; caudicle of the pollinia short, subtriangular; gland large. Fl. B. I. v. 6, p. 46; Woodr, in Journ. Bomb. Nat. v. 12 (1899) p. 519. Saccolabium Wightianum, Lindl. in Wall. Cat. 7303 in part (not of Dalzell & Gibson); Wight, Icon. t. 917. Saccolabium. rubrum, Wight, Icon. v. 5, part 1 (1852) p. 9, t. 1673 (not of Lindl.); Dalz. & Gibs. p. 264.—Flowers: May.

Ronkan: Salsette, Dalzell & Gibson. Deccan: Mahableshwar, Woodrow. Kanara: near Konapa on the Kula naddi, Ritchic, 715!—Distrib. India (W. Peninsula).

Woodrow in his list of Bombay plants notes this as occurring at Mahableshwar.—I have never met with it there nor does Mr. H. M. Birdwood mention it in his list of Mahableshwar and Matheran plants.

EXCLUDED SPECIES.

ERIDES ODORATUM, Lour. Fl. Cochinch. (1790) p. 525. Stem very stout. Leaves flat, keeled, oblong, blunt and obtusely 2-lobed at the apex, 6-12 by 1-13 in. Flowers fragrant, white with pink spots, in supra-axillary deflexed many-flowered racemes as long as or longer than the leaves; peduncles short with short distant sheaths; bracts broad, sheathing, blunt. Sepals unequal, spreading; lateral sepals larger than the dorsal, blunt; dorsal sepal elliptic, obtuse. Lip adnate to the short foot of the column; side lobes shallow, truncate, erose; midlobe linear, entire or erose, lying between the edges of the side lobes; spur large, infundibuliform, curved forwards. Anther triangular, depressed, beaked; pollinia globose; caudicle linear; gland quadrate.

In Sir J. Hooker's 'Flora of British India,' v. 6, p. 47, the word Concan is a misprint for Circars, which is the locality given by Heyne in Herb. Rottl. There are no specimens from the Konkan in Herb. Kew. Woodrow in his list of Bombay plants [Journ, Bomb. Nat. v. 12 (1899) p. 519] gives the Konkan as habitat, but has evidently done so on the authority of the 'Flora of British India.' King & Pantling, in Ann. Roy. Bot. Gard. Calc. v. 8 (1898) p. 212, t. 282, give the following distribution of the plant, viz.: Sikkim, westwards to Nepal, Khasia Hills, Silhet, Chittagong, Birma,

Cochinchina, China, and Java.

19. LUISIA, Gaud.

Epiphytic herbs with rigid, terete, usually erect sheathed stems woody below. Leaves terete, fleshy, distant, spreading. Flowers usually small, of a dull color, in short extra-axillary spikes; rhachis stout; floral bracts short, scarious, persistent. Sepals subequal or the depressed dorsal smaller. Petals equal to the sepals or much longer, spreading. Lip sessile on the base of the column, divided into 2 parts, the hypochile (basal part of lip) concave or flat, the epichile (apical part of lip) decurved, broad and ridged, entire or crenate, undulate, more or less blunt. Column stout, much shorter than the lip; stigma usually large; anther broad, 2-celled; pollinia 2, ovoid or subglobose, attached by a broad caudiele to a subquadrate or elongate gland. Capsule narrow, ridged, suberect.—Distair. Species about 15, mostly tropical Asiatic, a few Australian.

1. Luisia teretifolia, Gaud. Bot. Freyc. Voy. (1826) p. 427, t. 37. Stem 6-12 in. long, about as thick as a swan's quill, sometimes branching and with stout vermiform roots; internodes $\frac{1}{2}$ - $\frac{3}{4}$ in. long. Leaves terete, spreading, 3-7 by $\frac{1}{16}$ - $\frac{1}{6}$ in., green spotted with purple, the tip rounded. Flowers in short 2-3-flowered spikes reaching with the peduncle 1-2 in. long. Sepals greenish-yellow; lateral sepals $\frac{1}{5}$ by $\frac{1}{10}$ in., oblong, subacute, with a winged keel at the back; dorsal sepal linear-oblong, $\frac{1}{16}$ in. broad. Petals yellow, as long as the sepals, linear-oblong, obtuse. Lip $\frac{1}{4}$ in. long; hypochile green spotted with purple, quadrate, subsaccate; epichile dark purple, broadly cordate, rhomboid-ovate, obtuse, obscurely 3-lobed, deflexed, fleshy. Column stout, $\frac{1}{10}$ in. long; anther depressed;

pollinia 2, attached by a stout caudicle to a broadly oblong gland. Capsules $\frac{n}{4}-1\frac{n}{3}$ in. long. Fl. B. I. v. 6, p. 22; King & Pantling, in Ann. Roy. Bot. Gard. Calc. v. 8 (1898) p. 202, t. 271; Trim. Fl. Ceyl. v. 4, p. 190; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519; Prain, Beng. Pl. p. 1018. Cymbidium triste, Roxb. Hort. Beng. (1814) p. 63; Bot. Mag. t. 3648; Wight, Icon. t. 911 (text only). C. tenuifolium, Wight, Icon. t. 1689 (excluding text).—Flowers: May-June.

KONKAN: W. Ghats, Woodrow. KANARA: Usheli, Ritchie, 1417! - DISTRIB. India. (Silkum, Khasia Hills, Bengal, Pegu, Andamans, W. Peninsula); Ceylon.

2. Luisia tenuifolia, Blume, Rumph. v. 4 (1848) p. 50. Stem 12 in. or more long, slender. Leaves 4-7 in. long, very variable in thickness, sometimes very slender, green, spreading, straight or flexuous; tip rounded. Flowers tew, in short spikes ½ in. long together with peduncle. Sepals yellowish with a purple tinge; lateral sepals ¾ by ¼ in., ovate, subacute, concave; dorsal sepal oblong, obtuse. Petals ¾ by ½ in. linear, obtuse, of the same color as the sepals. Lip exceeding ½ in. long, narrowly pandurate, convex, base broad, 2-auricled, tip with 2 divergent lobules, dark purple with a white patch on either side, the terminal lobes pale purple (Trimen); disk with 3 large calli. Fl. B. I. v. 6, p. 24; Dalz & Gibs. p. 266; Wight, Icon. t. 911 (excluding text); Trim. Fl. Ceyl. v. 4, p. 191; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519. Cymbidium tenuifolium, Lindl. Gen. & Sp. Orchid. (1833) p. 167 (exclud. syn.); Grah. Cat. p. 203.—Flowers: Aug.

Konkan: Stocks!, Law!, Dalzell, 41! & 49! S. Konkan, Nimmo ex Graham. Kanara; Bomenhali (N. Kanara), Woodrow.—Distrib. India (W. Peninsula); Ceylon.

20. COTTONIA, Wight.

Epiphytic; stem stout, elongate, terete, leafy, emitting stout vermiform roots. Leaves long, narrow, coriaceous; internodes short. Flowers in short racemes; peduncles very long, slender, simple or paniculately branched; bracts small. Sepals subequal, spreading. Petals rather narrower than the sepals, spreading or reflexed. Lip sessile, not jointed at the base of the column, flat, much longer than the sepals, subpandurate, 2-auricled at the base, with interposed calli; side lobes indistinct; midlobe rounded, retuse, with villous margin. Column short, without a foot; authers depressed, hemispheric, 2-celled; pollinia 2, pyriform, 2-cleft, or 4, the 2 smaller incumbent on the larger; caudicle long, narrow; gland small.—Distrib. India and Ceylon; species 1.

1. Cottonia macrostachys, Wight, Icon. v. 5, part 1 (1852) p. 21, t. 1755. Stem 4-8 in. long, nearly as thick as the little finger, clothed with short appressed sheaths. Leaves 5-8 by $\frac{1}{2}$ - $\frac{2}{6}$ in., lorate, spreading, straight or recurved, abruptly ending in 2 lobes, one longer and more rounded than the other with a broad acute sinus between them, keeled beneath, dull green, sometimes obscurely mottled. Flowers somewhat resembling a humble-bee, in short few-flowered racemes; peduncles 12-30 in. long, erect, green, often mottled with red, simple or branched, the branches forming terminal racemes; bracts minute, ovate, persistent; pedicels with ovary $\frac{1}{2}$ - $\frac{3}{4}$ in. long; flower-buds subglobose. Sepals greenish-yellow veined with red; lateral sepals $\frac{3}{6}$ by $\frac{1}{6}$ in., ovate-

oblong, subobtuse; dorsal sepal $\frac{3}{3}$ by $\frac{1}{5}$ in., obvaate-oblong. Petals greenish-yellow veined with red, $\frac{1}{3}$ by $\frac{1}{8}$ in., oblanceolate, obtuse. Lip nearly $\frac{1}{2}$ in. long by $\frac{1}{3}$ in. broad, 2-auricled at the base, subpandurate, purple with yellow villous border; side lobes obscure; midlobe rounded, retuse. Capsules $1\frac{1}{2}-2\frac{1}{4}$ in. long, narrowly fusiform, acutely angled. Fl. B. I. v. 6, p. 26; Dalz. & Gibs. p. 263; Bot. Mag. t. 7099; Trim. Fl. Ceyl. v. 4, p. 203; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519.—Flowers: Apr.—May.

Konkan: Stocks!, Law!, Woodrow, 7!; South Konkan, Dalzell, 4! Kanara: N. Kanara, Woodrow; Supa, Ritchie, 1424!—Distrib. India (W. Peniasula); Ceylon.

21. **VANDA,** R. Br.

Epiphytic herbs; stems leafy. Leaves thickly coriaceous or fleshy, flat and keeled, or terete. Flowers large and often showy, axillary, in simple lax or dense racemes, or sometimes solitary; floral bracts much shorter than the ovary. Sepals spreading or connivent, narrowed at the base. Petals like the sepals. Lip large, usually saccate or spurred at the base; side lobes large or small (rarely obsolete), adnate to the short foot of the column or to the sides of the sac or spur; midlobe fleshy, various; disk usually ridged or lamellate, sometimes carunculate. Column short, stout, with or without a short foot; anther 2-celled; rostellum small; pollinia 2, didymous, globose, ovoid or obovoid; caudicle short and broad or long and geniculate; gland usually large.—Distrib. Tropical Asia and Australia; species about 20.

Stem 4-6 in. long; flowers less than 1 in. across, yellow except the blue fleshy ridges on the lip; capsule 1-1½ in. long

Stem 12-24 in. long; flowers 1½-2 in. across; sepals and petals greenish with brown nerves; midlobe of lip violet; capsule 3 in. long

1. V. parviflora.

2. V. Roxburghii.

1. Vanda parviflora, Lindl. in Bot. Reg. v. 30 (1844) Misc. p. 45. Stem stout, 3-6 in. long, leafy, clothed with the remains of sheaths of fallen leaves, emitting large vermiform roots. Leaves 3-8 by $\frac{3}{8}-\frac{1}{2}$ in., linear-oblong, conduplicate, keeled, unequally and obtusely 2-lobed at the apex. Flowers in few-flowered racemes from below the leaves and about as long as them; rhachis of raceme stout; bracts $\frac{1}{12}$ in. long, ovate, acute; peduncles about as long as the racemes; pedicels with ovary $\frac{5}{8}-\frac{3}{4}$ in. long. Sepals yellow; lateral sepals $\frac{1}{5}$ by $\frac{1}{6}$ in., broadly obovate or suborbicular; dorsal sepal slightly longer than the lateral, $\frac{1}{6}$ in. broad, obovate-oblong. Petals yellow, $\frac{1}{6}$ by $\frac{1}{10}$ in., spathulate-oblong. Lip $\frac{1}{6}$ in. long, adnate to the foot of the column, spurred; spur narrowly infundibuliform, curved at the tip; side lobes erect, oblong, rounded, rising from the mouth of the spur; midlobe fleshy, subquadrately obovoid, decurved, the tip dilated, crenulate, truncate or retuse; disk whitish, with 2 broad fleshy lilac-colored ridges. Column short with a short foot; anther depressed; pollinia subglolose; caudicle broad, short. Capsules $1-1\frac{1}{2}$ in. long, clavate or fusiform, with winged ridges. Fl. B. I. v. 6, p. 50; Wight, Icon. t. 1669; Trim. Fl. Ceyl. v. 4, p. 192; King & Pantling, in Ann. Roy. Bot. Gard. Calc. v. 8 (1898) p. 215, t. 286; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519; 'rain, Beng. Pl. p. 1021. Ærides Wightianum, Lindl. in Wall.

Cat. 7320; Wight, Icon. v. 5, part 1 (1852) p. 8; Dalz. & Gibs. p. 265. ?Vanda spathulata, Grah. Cat. p. 204 (not of Spreng.).—Flowers: May.

KONKAN: Stacks!, Law!, Gibson!, Woodrow; S. Konkan, Dalzell & Gibson. Drecan: Miwal, Woodrow; hills round Mahableshwar, Cooke! S. M. Country: Belgaum and Kolhapur Road, Ritchie, 1433!—Distrib. India (Silkim, Kumaon, Nepal, Assam, Birma, W. Peninsula), Ceylon.

2. Vanda Rouburghii, R. Br. in Bot. Reg. v. 6 (1820) t. 506. Stem 1-2 ft. long, stout, scandent by the stout, simple or branching roots. Leaves thickly coriaceous, 6-8 by $\frac{1-3}{4}$ in., recurved, complicate, obtusely keeled, premorse, with usually 2 unequal rounded lobes and an acute interposed one. Flowers in 6-10-flowered racemes reaching with the pedancle 6-10 in. long; bracts scarious, \frac{1}{8} in. long, ovate, acute: pedicels with ovary 12-2 in. long. Sepals yellow, tessellated with brown lines and with white margins; lateral sepals 1 by 5 in., obovate with subcuneate bases and with more or less waved margins; dorsal sepal as long as the lateral, & in. broad, obovate-oblong. Petals yellow with brown lines and white margins, shorter than the sepals, & in. wide. Lip 5 in. long, bluish dotted with purple; side lobes rising from the mouth of the spur + in. long, ovate, acute, erect; midlobe 7 in. long, pandurate, the lower part broadly elliptic, the apical portion quadrate, dilated at the fleshy 2-lobed tip; disk tumid, with fleshy ridges; spur straight, conical, obtuse, \(\frac{1}{4}\) in. long. Column very short; pollinia ellipsoid or subglobose; caudicle short, broad; gland large. Capsules 3-31 in. long. narrowly clavate-oblong with acute ribs and a short pedicel. El. B. I. v. 6, p. 52; Grah. Cat. p. 204; Wight, Icon. t. 916; Trim. Fl. Ceyl. v. 4, p. 192; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519: Prain, Beng. Pl. p. 1021 .- Flowers: July.

Konkan: Woodrow, 1! Gujarat: Ohikli on the Atavesi River, Gibson! Kanara: Kála naddi, Ritchic, 1425!—Distrib. India (Bengal, Behar, W. Peninsula); Ceylon.

22. DIPLOCENTRUM, Lindl.

Epiphytic herbs; stems short, leafy; pseudobulbs 0. Leaves distichous, narrow, fleshy, subterete or complicate. Flowers small, in long subspiciform racemes; peduncles lateral, sometimes branched. Sepals subequal or the lateral larger. Petals like the dorsal sepal. Lip sessile, jointed on the base of the column, spreading, entire, shortly 2-spurred; disk fleshy. Column very short, 2-auricled, truncate; anther 2-celled; pollinia 2, ovoid, sulente or 2-partite, attached by a broad caudicle to a broad gland.—Distrib. Species 2 or 3, Indian.

1. Diplocentrum congestum, Wight, Iron. v. 5 (1852) part 1, p. 10, t. 1682. Stem short. Leaves $3-3\frac{1}{2}$ by $\frac{2}{b}-\frac{5}{8}$ in., linear-oblong, recurved, unequally and obtusely 2-lobed at the apex. Flowers numerous, in pendulous sometimes sparingly branched racemes 3-6 in, long; bracts spreading, triangular-ovate, $\frac{1}{20}-\frac{1}{8}$ in, long; pedicels $\frac{1}{8}$ in, long. Sepals dull brownish-green, $\frac{1}{b}-\frac{1}{6}$ in, long; lateral sepals reflexed. Petals colored as the sepals, $\frac{1}{10}-\frac{1}{8}$ in, long, elliptic-oblong, obtuse. Lip about $\frac{1}{6}$ in, long, rose-colored, reflexed and truncate at the apex, rather broader and obtusely keeled at the base; spurs 2, saccate-oblong, $\frac{1}{16}$ in, long, slightly divergent. Capsules less than $\frac{1}{2}$ in, long, oblong, shortly pedicellate.

Fl. B. I. v. 6, p. 78; Rolfe, in Hook. Icon. Pl. v. 27 (1901) t. 2687.— Flowers: June-Sept.

Rare. KANARA: Sirsi-Kumpta road (N. Kanara), Woodrow!-Distrib, India (W. Peninsula).

23. ACAMPE, Lindl.

Epiphytic herbs; stem usually very long and stout. Leaves thickly coriaceous, keeled, distichous, oblique at the apex. Flowers corymbose, in large spreading panicles, fleshy, brittle, yellow, spotted; peduncles short, rigid, lateral; bracts broad, short, persistent. Sepals fleshy, brittle, flat: lateral sepals adnate to the usually small spur of the lip; dorsal sepal often slightly larger than the lateral ones. Petals like the sepals, straight. Lip fleshy, bent upwards, saccate or spurred, adnate to the footless column, often tuberculate and pubescent within the sac. Column short, thick, without a foot; anthers ovate, 2-celled; pollinia 2, waxy, globose; caudicle slender, linear, longer than the pollinia; gland small, subrotund.—DISTRIB. Tropical Asia; species 8 or 9.

The genus was founded by Lindley in 1853 [Fol. Orchid. (Acampe)]. The 'Flora of British India' places it as a section (Acampe) under Saccolabium, but the genus seems sufficiently well defined to have independent rank accorded to it. Ridley remarks [Journ. Linn. Soc. v. 32 (1896) p. 346] that there seems no good reason why the genus should be merged in Saccolabium. Pfitzer [Engl. & Prantl, Pflanzenf. v. 2, part 6 (1889) p. 213] keeps the genus distinct and Mr. Rolfe of the Kew Herbarium is also in favor of so maintaining it.

1. Acampe Wightiana, Lindl. Fol. Orchid. (1853) p. 2 (Acampe). Stem 12-18 in. long, as thick as the little finger, clothed with sheaths of fallen leaves; internodes short; roots long, very stout. Leaves 4-8 by $\frac{5}{8}-1\frac{1}{4}$ in., ligulate, thickly coriaceous, flat, irregularly 2-lobed at the apex, the lobes rounded, usually with an acute sinus. Flowers corymbose, in supra-axillary panicles $1\frac{1}{2}-2\frac{1}{2}$ in. long including the peduncle; peduncle about as long as the panicle, stout, with many cupular sheaths; bracts short, broadly ovate, persistent; pedicels with ovary $\frac{1}{8} - \frac{1}{4}$ in. long. Sepals yellow, barred with red; lateral sepals $\frac{3}{8}$ by $\frac{1}{9}$ in., elliptic-oblong, obtuse; dorsal sepal as long and as broad as the lateral ones, obovateoblong, obtuse. Petals yellow, barred with red, $\frac{1}{3}$ by $\frac{1}{10}$ in., obovate, Lip less than 1 in. long, white, with a few transverse red obtuse. stripes; side lobes small, rounded; midlobe 1/6 in. long, ovate, obtuse, fleshy; spur a short rounded sac. Pollinia 2, large, globose; caudicle short; gland small. Capsules 1\frac{1}{2}-3 in. long, sessile or nearly so, clavate, or oblong, or fusiform, with many ribs. Acampe excavata, Lindl. Fol. Orchid. (1853) p. 3 (Acampe). Saccolabium Wightianum, Hook. f. Fl. B. I. v. 6 (1890) p. 62; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519; Trim. Fl. Ceyl. v. 4, p. 199. Saccolabium pramorsum, Hook. f. Fl. B. I. v. 6 (1890) p. 52; Prain, Beng. Pl. p. 1022. S. papillosum, Dalz. & Gibs. Bo. Fl. (1861) p. 264 (not of Lindl.). Erides præmorsum, Grah. Cat. p. 204 (not of Willd.). Vanda Wightiana, Lindl. ex Wight, Icon. v. 5, part 1 (1852) p. 9, t. 1670.—Flowers: May.

Konkan: Graham, Stocks!, Law!, Woodrow, 5!; Indapur (S. Konkan), Graham. S. M. COUNTRY: Belgaum, Ritchie, 716!-DISTRIB. India (Bengal, W. Peninsula); Ceylon.

I cannot separate Acampe excavata, Lindl., from this. The material in Herb. Kew. is scanty and an examination of fresh specimens much to be desired.

3л

24. SARCANTHUS, Lindl.

Epiphytic herbs; stems usually elongate; pseudobulbs 0. Leaves fleshy, terete or flat. Flowers small, in extra-axillary racemes or panicles; bracts small. Sepals subequal, all spreading or reflexed, or the dorsal concave or connivent over the column. Petals rather smaller than the sepals, spreading. Lip adnate to the base of the column or to its foot; base with an infundibuliform spur sometimes dilated at the apex, divided by a longitudinal septum reaching from the base to about half-way up or higher, but not reaching the mouth, with a callus both on the upper and lower walls; side lobes small, more or less triangular and acute; midlobe small, triangular or hastate. Column short, stout, often with a foot as long as or longer than itself; anther depressed; pollinia 2, bifid.—Distrib. Eastern Tropical Asia; species about 35.

1. Sarcanthus peduncularis, Dalz, in Kew Journ, Bot. v. 3 (1851) p. 343. Stem 10-12 in. long, about as thick as a duck's quill, pendulous, Leaves coriaceous, 4-6 by 1 in., linear, obtusely acuminate, narrowed at the base, straight or falcately recurved, the sheaths ribbed. Flowers deflexed, in racemes which are shorter than the leaves; bracts minute, ovate, acute, persistent; pedicel with ovary 12 in. long. Sepals yellow with red margins; lateral sepals by 10 in., elliptic, obtuse; dorsal sepal slightly longer and slightly narrower than the lateral ones, spathulate-oblong. Petals $\frac{1}{8}$ by $\frac{1}{12}$ in., spathulate, colored like the sepals. Lip white or yellowish, with violet side lobes, $\frac{1}{\kappa}$ in long; side lobes triangular, acute, small; midlobe incurved, acute; spur 10-1 in. long, subcylindric or conical, septate almost to the mouth. Column short: anther with a long subulate beak; pollinia 2-partite; caudicle slender; gland small. Capsules 2-3 in. long, fusiform or oblong, sessile or nearly so. Fl. B. I. v. 6, p. 67; Dalz. & Gibs. p. 264; Trim. Fl. Ceyl. v. 4, p. 200. Sarcanthus pauciflorus, Wight, Icon. v. 5 (1852) part 1, p. 20, t. 1747 (bad).—Flowers: July-Aug.

KONKAN: Stocks, 35!, Law!; near the village of Virdi in Wari country, Dalzell! KANANA: Kala naddi, Ritchie, 1430!—Distrib. India (W. Peninsula); Ceylon.

25. POGONIA, Juss.

Terrestrial, tuberous-rooted, 1-leaved herbs; tuber giving off below the surface of the ground 2 or 3 stolons, each producing at its tip a tuber smaller than that of the parent. Leaf broadly cordate or orbicular, strongly plicate, from the same tuber as the flowers, but usually subsequent to the appearance of the flowering scape, occasionally contemporaneous with the flowers. Flowers solitary, or few, or several, racemose, often pendulous on scapes arising from the tuber. Sepals subequal, narrow, connivent or spreading. Petals like the sepals. Lip adnate to the base of the column, sometimes slightly saccate at the base, rather narrow, the lower portion convolute round the column; side lobes small or 0; midlobe flat, ovate or orbicular, entire or fimbriate. Column elongate, clavate upwards; stigma anticous, oblong or orbicular; anther more or less incumbent, substipitate; pollinia 2 or 4, elongate, powdery, often coherent, without caudicle or gland.—Distrib. Species about 60, Asiatic, American, and African.

Scapes 1-3-flowered; bracts $\frac{1}{10}$ in. long; lip without side lobes ... 1. P. plicata. Scapes many-flowered; bracts $\frac{1}{2}$ in. long; lip with obtuse side lobes. 2. P. carinata.

1. Pogonia plicata, Lindl. Gen. & Sp. Orchid. (1840) p. 415. Tuber globose, ½ in. in diam. or less. Leaf dark green mottled with purplish-brown, lying flat on the ground and appearing after the flowers have withered, 2-4 in. long and nearly as broad as long, broadly ovate or suborbicular, obtuse, acute or shortly acuminate, many-nerved from a cordate base; petioles \(\frac{3}{4} - 2\frac{1}{2} \) in. long. Scape 3-6 in. long with 2 or 3 tubular sheaths with subacute dilated apices. Flowers 2 or 3; floral bract \(\frac{1}{10} \) in. long, ovate, acute. Sepals \(\frac{5}{8} \) by \(\frac{1}{16} \) in., linear-lanceolate, acuminate, yellowish-green. Petals like the sepals and similarly colored. Lip lilac with a green spot at the base and a yellow line along the thickened part of the midrib, less than \(\frac{1}{2} \) in. long, convolute and embracing the column, entire except the minutely emarginate apex, the midrib thickened and callus-like for more than half its length, the base slightly saccate. Column narrowed in the lower half, the upper portion clavate; pollinia 4, narrowly oblong. Fl. B. I. v. 6, p. 119; King & Pantling, in Ann. Roy. Bot. Gard. Calc. v. 8 (1898) p. 263, t. 358; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519; Prain, Beng. Pl. p. 1025. ? Pogonia flabelliformis, Dalz. & Gibs. Bo. Fl. (1861) p. 270 (not of Lindl.).—Flowers: June.

Konkan: Stocks!, Law! Deccan: Lanoli, Woodrow!; Khandala, Cooke!—Distrib. India (Bengal, W. Peninsula).

2. Pogonia carinata, Lindl. Gen. & Sp. Orchid. (1840) p. 414. Leaf $1\frac{1}{2}-2\frac{1}{2}$ in. in diam., orbicular, cuspidate, 7-9-nerved, glabrous, base broadly cordate, the central part cuneate; petioles 1-3 in. long. Flowers numerous, in racemes measuring with the stems 6-12 in. long; bracts linear, acute, $\frac{1}{2}$ in. long. Sepals pale-green, $\frac{1}{8}$ in. long, oblong-lanceolate, acuminate, nerved. Petals like the sepals in form and color. Lip with purple veins and spots on a pale greenish-yellow ground, $\frac{2}{4}$ in. long, not saccate at the base, 3-lobed about the middle; side lobes $\frac{1}{10}$ in. long, rounded; midlobe $\frac{1}{4}$ in. long, ovate-oblong, subobtuse, cremulate. Fl. B. I. v. 6, p. 121; Dalz. & Gibs. p. 270; Prain, Beng. Pl. p. 1026. Pogonia flabelliformis, Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519. Epipactis carinata, Roxb. Fl. Ind. v. 3 (1832) p. 454; Grah. Cat. p. 205.—Flowers: May-June.

Konkan: Stocks!, Law! Deccan: Lanoli, Woodrow. S. M. Country: near Dharwar, Law ex Stocks, 68! Kanara: Law!—Distrib. India (Bengal, W. Peninsula).

26. SPIRANTHES, Rich.

Terrestrial leafy herbs with tuberous or fibrous roots. Leaves linear (in the Indian species). Flowers small, secund, on a twisted erect spike. Sepals subequal, free or sometimes cohering with the petals to form an erect hood; lateral pair gibbous at the base. Petals like the dorsal sepal. Lip erect, entire or 3-lobed, the base concave but neither saccate nor spurred; disk bearing lamellæ or calli. Column short, terete; stigma single, broad, anticous; rostellum erect, obtuse, or elongate and 2-fid; anther erect, 2-celled; pollinia 4, united in pairs, sessile on a small gland.—Distrib. Species about 80, temperate and tropical.

1. Spiranthes australis, Lindl. in Bot. Reg. v. 10 (1824) sub t. 823. Whole plant 6-18 in. high; stem stout or slender; roots consisting of elongate fleshy white cylindric or almost tuberous fibres.

Leaves 4-5, alternate, usually clustered near the base of the stem, 13-5 by 4 in., linear or linear-lanceolate, acute or acuminate, sometimes oblanceolate, shortly sheathing. Stem with a few distant, acute sheaths (reduced leaves). Flowers numerous, in spikes 3-6 in. long on a glandular-pubescent spirally twisted rhachis; bracts ovate, acute or acuminate, exceeding the sessile ovary. Sepals 1 by 1 in., subequal, ovate-oblong, acute, with broad bases. Petals slightly shorter than the sepals, $\frac{1}{25}$ in. broad, linear, obtuse, more or less connate with the dorsal sepal into a hood. Lip $\frac{1}{10} - \frac{1}{8}$ in. long, 3-lobed, dilated at base and apex, the base subsaccate, 2-glandular, the apex subquadrate, truncate, retuse, crenulate. Pollinia cohering, clavate. Capsules 1 in. long, fusiform, ribbed. Fl. B. I. v. 6, p. 102; Dalz. & Gibs. p. 270; Wight, Icon. t. 1724 (middle and right-hand figs.); King & Pantling, in Ann. Roy. Bot. Gard. Calc. v. 8 (1898) p. 278, t. 369; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519; Prain, Beng. Pl. p. 1028.

Rare in the Bombay Presidency. Konkan: Stocks! S. M. Country: Chorla Chit, Dalzell & Gibson. Kanana: Dalzell, 40!—Distrib. Throughout the mountainous parts of India at suitable elevations; Ceylon, Afghanistan, Northern Asia, China, Java. Australia, New Zealand.

27. ZEUXINE, Lindl.

Terrestrial herbs; stems decumbent at the base, succulent, glabrous. Leaves membranous, sometimes withering at flowering time. Flowers small, in racemes or spikes. Sepals usually subequal; lateral pair free; dorsal sepal concave and forming a hood with the petals. Petals like the dorsal sepal. Lip adnate to the base of the column, cymbiform or saccate, the apical lobe shortly clawed or sessile, divided into 2 oblong subquadrate more or less truncate divergent lobules, or entire, or with narrow decurved lobules; sac at the base with calli or lamine inside. Column very short, its anterior face with lamellar or conical processes; stigmas 2, lateral, distant; anther membranous, sometimes ridged, its cells contiguous; pollinia pyriform, attached by an oblong gland to the erect rostellum.—Distrib. Species about 20, Tropical Asiatic and African:

Leaves linear, sessile; lip not longer than the sepals; pollinia sessile on an oblong gland 1. Z. sulcata. Leaves ovate, petiolate; lip twice as long as the sepals; pollinia adnate for two-thirds of their length to the linear appendage of the gland

.. 2. Z. longilabris.

1. Zeuxine sulcata, Lindl. Gen. & Sp. Orchid. (1840) p. 485. Whole plant 2-10 in. high; stem passing into the peduncle, leafy, glabrous. Leaves 1-2 by $\frac{1}{n}-\frac{1}{4}$ in., linear, acuminate, clasping, sessile on the hyaline truncate sheaths, gradually passing into linear bracts upwards. Flowers in densely-flowered racemes 1-2 in. long; bracts in. long, much exceeding the ovary, ovate, caudate-acuminate, erect, membranous; pedicels very short. Sepals unequal, greenish-white; lateral pair 1 by 1 in., smaller than the dorsal, obliquely ovate-oblong, subobtuse; dorsal sepal $\frac{1}{b}$ by $\frac{1}{10}$ in., concave, ovate, obtuse. Petals greenish-white, slightly shorter than the dorsal sepal, $\frac{1}{1.8}$ in. broad, falcately oblong, obtuse, united with the dorsal sepal to form a hood over the column. Lip 1/8 in. long, hammer-headed, yellow, with a small cymbiform sac at the base; apical lobe $\frac{1}{20}$ by $\frac{1}{12}$ in., subquadrate,

entire or emarginate at the apex. Column very short, with 2 wings_at its apex covering the auther; arms of rostellum short, stout, parallel; anther depressed, very shortly beaked, covered by the wings of the column; pollinia clavate, sessile on an oblong gland. Fl. B. I. v. 6, p. 106; King & Pantling, in Ann. Roy. Bot. Gard. Calc. v. 8 (1898) p. 286, t. 381; Trim. Fl. Ceyl. v. 4, p. 215; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519; Prain, Beng. Pl. p. 1029; Watt, Dict. Econ. Prod. v. 6, part 4, p. 355. Zeuxine bracteata, Wight, Icon. v. 5, part 1 (1852) p. 16, t. 1724 (bis). Z. brevifolia, Wight, Icon. l. c. t. 1725. Z. robusta, Wight, Icon. l. c. t. 1726.—Flowers: Jan.

KONKAN: Stocks!, Law! Deccan: hills in the Deccan, Cooke!, Woodrow! S. M. COUNTRY: Dharwar, Law! KANARA: Law! SIND: Stocks, 411!—DISTRIB. Throughout India; Ceylon, China, Japan, Java, Afghanistan, Philippines.

2. Zeuxine longilabris, Benth. in Benth. & Hook. f. Gen. Pl. v. 3 (1883) p. 600. Whole plant about 6-10 in. high, slender, ascending from a creeping and rooting base, about as thick as a crow's quill. Leaves few, rather distant, $1-1\frac{3}{4}$ by $\frac{1}{3}-\frac{1}{2}$ in., shortly petiolate, ovate or ovate-oblong, acute, 7-nerved, glabrous, base rounded; sheaths short, hvaline, inflated. Flowers in lax few-flowered spikes; scape including the spike 4-10 in. long, very slender, pubescent, with 2 or 3 distant lanceolate sheaths; rhachis of spike glandular-pubescent, 2-3 in. long; bracts about as long as the pubescent ovary, narrowly lanceolate. Sepals \(\frac{1}{4}\) in. long, greenish, oblong, obtuse, pubescent. Petals white, twice as long as the sepals. Lip with a claw which is saccate at the base, gradually dilated into the deeply 2-lobed obovate-cuneate midlobe, the cuneate lobes or wings of which are separated by a narrow acute sinus and are crenulate or coarsely toothed on the outer margin; sac with 2 spurs in the cavity. Anther with a long beak; pollinia pyriform, adnate for two-thirds of their length to the linear appendage of the small gland. Fl. B. I. v. 6, p. 107; Trim. Fl. Ceyl. v. 4, p. 216; Prain, Beng. Pl. p. 1029. Monochilus longilabre, Lindl. Gen. & Sp. Orchid. (1840) p. 487; Dalz. & Gibs. p. 271. M. affine, Wight, Icon. v. 5, part 1 (1852) p. 16, t. 1728.

Rare in the Bombay Presidency. Konkan: Law!, Stocks!—Distrib. India (Bengal, Assam, W. Peninsula); Ceylon.

28. CHEIROSTYLIS, Blume.

Terrestrial herbs; stems decumbent and succulent at the base. Leaves membranous. Flowers few, racemose. Sepals united in their lower half into a ventricose tube. Petals shorter than the sepals. Lip saccate or cymbiform at the base, the sac with enclosed calli or setæ, the anterior lobe shortly clawed, 2-lobed or fimbriate. Column short with 2 long fleshy appendages in front; rostellum 2-cleft; stigmas 2, lateral; anther erect, its cells short; pollinia 2, bipartite; caudicle short; gland oblong.—Distrib. Species about 12, chiefly Indian and Malayan.

1. Cheirostylis flabellata, Wight, Icon. v. 5, part 1 (1852) p. 16. Whole plant 4-8 in. high. Leaves thin, $\frac{1}{2}$ - $\frac{3}{4}$ by $\frac{3}{8}$ - $\frac{1}{2}$ in., ovate, acute, 3-nerved and reticulately veined, glabrous, base rounded or subcordate; sheaths hyaline, truncate, inflated; petioles $\frac{1}{8}$ - $\frac{3}{8}$ in long. Flowers few, white, in short racemes which rarely reach 1 in. long; scapes 6-7 in.

long, slender; sheaths few, loose, acuminate; bracts $\frac{1}{5}$ in. long, ovate, acuminate. Sepals $\frac{1}{6}$ in. long, united half-way up into a ventricose tube, the lobes ovate-oblong. Petals linear-oblong, falcate, obtuse, the fips exserted. Lip $\frac{1}{4}$ in. long, with a short saccate claw and a broad spreading suborbicular 2-lobed limb, the lobes sub-5-fid; sac cymbiform, with 2 enclosed calli. Column short; appendages and rostellar arms long, subspathulate; anther with a dilated membranous tip; pollinia 2, pyriform, subsessile on the elongate gland. Fl. B. I. v. 6, p. 105; Dalz. & Gibs. p. 271; Trim. Fl. Ceyl. v. 4, p. 211; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519. Monochilus flabellatum, Wight, Icon. t. 1727.—Flowers: Mar.

S. M. Country: Chorla Ghát, Dalzell & Gilvon. Kanara: Kumpin-Sirsi road, Woodrov.—Distrib. India (Bhotan Himalaya, Tenasserim, W. Peninsula); Ceylon.

29. PERISTYLUS, Blumo

Terrestrial herbs. Sepals and petals free, subequal, connivent or subconnivent. Lip continuous with the column, free or slightly aduate to it, produced at the base into a short (sometimes very short) spur, creet or somewhat spreading, entire or 3-lobed. Column short, footless; clinandrium erect, short. Anther-cells parallel; apex inferior, short and adnate to the base of the column; pollinia granular with short caudicles and exserted naked glands; staminodes lateral, auriculate. Stigma sessile. Rostellum subulate or tooth-like, situated between the anther-cells. Capsule ellipsoid or oblong.—Districe. Throughout the N. temperate regions and in the tropics of Asia and Africa, chiefly in the mountains; species 40 or 50.

1. Peristylus Stocksii, Kraenzlin, Orchid. $C_{len.}$ et Sp. v. 1 (1898) p. 513. Whole plant 6-18 in. high; stem slehder, with numerous sheaths in the lower part. Leaves more or less clustered towards the middle of the stem, variable, 3-4 by $\frac{1}{2}-1\frac{1}{2}$ in., obovate or elliptic, or lanceolate, obtuse, acute or acuminate, usually petiolate. Flowers yellowish, in twisted spikes 3-6 in. long; peduncles with a few scales between the leaves and the spike; bracts $\frac{1}{4}-\frac{5}{2}$ in. long, ovate, acuminate, the lower bracts longer than the upper, sometimes shorter than the curved ovary. Sepals 1-nerved; lateral sepals $\frac{1}{10}$ by $\frac{1}{20}$ in. long, oblong, obtuse; dorsal sepal $\frac{1}{10}$ by $\frac{1}{12}$ in., elliptic-oblong, obtuse. Petals $\frac{1}{10}$ in. long, obliquely ovate, obtuse, subfleshy. Lip $\frac{1}{8}$ in. long, 3-lobed at the apex, the lobes shorter than the sepals; claw broad, concave; lateral lobes a little shorter and narrower than the midlobe, slightly incurved; midlobe $\frac{1}{10}-\frac{1}{12}$ by $\frac{1}{30}$ in., oblong, obtuse; spur $\frac{1}{6}-\frac{1}{9}$ in. long, inflated downwards, shorter than the ovary. Pollinia clavate. Stigmatic lobes clavate.

Rostellum reduced to a triangular tooth. Habenaria Stocksii, Hook. f. Fl. B. I. v. 6 (1890) p. 158; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520.—Flowers: July-Aug.

Konnan: Dalzell!, Law!; Dronaghiri, Stocks!; Neral below Matheran, Bhiva! S. M. Country: Ramghat, Ritchie, 1898!—Distrib. India (W. Peninsula).

2. Peristylus spiralis, A. Rich. in Ann. Sc. Nat. sér. 2, v. 15, p. 69, t. 2, B. Whole plant 6-18 in. high; stem leafy, often flexuous; tubers small, oblong, pyriform or globose. Leaves $1-2\frac{1}{2}$ by $\frac{1}{4}-\frac{3}{8}$ in., linear-lanceolate, obtuse, acute or acuminate, coriaceous, 5-7-nerved, sheathing at the base, the upper passing into numerous lanceolate sheaths. Flowers greenish-white, secund, in spirally twisted lax-flowered slender spikes 2-10 in. long; bracts $\frac{1}{4} - \frac{3}{8}$ in. long, lanceolate, finely acuminate, equalling or the lower exceeding the ovary. Lateral sepals h by 1 in., linear, obtuse, falcate; dorsal sepal h by 1 in., linearoblong, obtuse, concave. Petals $\frac{1}{6}$ by $\frac{1}{16}$ in., ovate-oblong or linear-oblong, obtuse. Lip variable, fleshy, $\frac{1}{6}$ in. long, rather longer than broad, with a short broad concave claw, 3-lobed nearly to the middle; side lobes usually slightly longer and much narrower than the midlobe, linear, acute, more or less spreading; midlobe $\frac{1}{16}$ by $\frac{1}{30}$ in., linear, obtuse; spur a small globose sac $\frac{1}{20}$ in. in diam. Anthers minute, the cells parallel; tubes 0; pollinia pyriform; caudicle short; glands oblong. Stigmatic processes short, clavate. Rostellum 3-fid. Icon. t. 1696; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1898) p. 510. Habenaria torta, Hook, f. Fl. B. I. v. 6 (1890) p. 159; Trim. Fl. Ceyl. v. 4, p. 234; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520.

Konran: Law!, Stocks, 67!; Western Gháts southwards, Woodrow.—Distrib. India (W. Peninsula); Ceylon.

3. Peristylus plantagineus, Lindl. Gen. & Sp. Orchid. (1835) p. 300. Whole plant 12-20 in. high; stem robust, leafy chiefly about the middle, closely embraced by many long narrowly lanceolate sheaths above the leaves, and with loose sheaths below them; tubers large, evlindric-oblong. Leaves few. 4-8 by 13-25 cylindric-oblong. Leaves few, 4-8 by $1\frac{3}{4}-2\frac{1}{2}$ elliptic-lanceolate, acuminate, strongly nerved at the base. Flowers in dense spikes 4-8 in. long; bracts reaching $\frac{5}{8}$ in. long, erect, narrowly lanceolate, acuminate. Sepals greenish; lateral sepals $\frac{1}{8}$ by $\frac{1}{12}$ in., elliptic-oblong, obtuse; dorsal sepal $\frac{1}{8}$ by $\frac{1}{10}$ in., oblong, obtuse. Petals white, very broad, obliquely orbicular, subcartilaginous, the tips recurved; nerves branching. Lip white, shorter than the sepals, broadly obovate, entire or shortly 3-lobed; lobes obtuse, contracted beyond the very short broad concave base; spur small, Anther-cells parallel; tubes short, recurved; pollinia clavate; caudicles short; glands small. Stigmatic processes short, stout. Rostellum short, acute. Wight, Icon. t. 921; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1898) p. 516. Peristylus elatus, Dalz. & Gibs. in Kew Journ. Bot. v. 3 (1851) p. 344; Dalz. & Gibs. p. 270. Habenaria Wightii, Trimen, Cat. Ceyl. Pl. (1885) p. 91; Hook. f. Fl. B. I. v. 6 (1890) p. 162; Trim. Fl. Ceyl. v. 4, p. 232; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520.—Flowers: July.

Konkan: Nimmo!; Malwan, Dalzell. S. M. Country: Ramghat, Ritchie, 1396: Kanaba: Law!—Distrib. India (W. Peninsula); Ceylon.

4. Peristylus goodyeroides, Lindl. VAR. β, affinis, Lindl. Gen. & Sp. Orchid. (1835) p. 300. Stem 1-2 ft. high, stout. Leaves close together about the middle of the stem, 6-10 by 2-21 in., elliptic-lanceolate, acute, contracted at the base, scarcely petiolate. Flowers yellowishgreen, in dense spikes 4-12 in. long; bracts 1-4 in. long, lanceolate. membranous, finely acuminate, the lower longer than, the upper equalling the sessile ovary. Lateral sepals 1 by 12 in., oblong, obtuse, mucronate at the back below the apex; dorsal sepal to by to in., elliptic-oblong, obtuse, not mucronate. Petals 1 by 1 in., obliquely obovate, strongly nerved. Lip 1/2 by 1/2 in., without a claw, usually 3-fid, the lobes very variable; spur subglobose, 12 in. long. Anther small; tubes very short; pollinia clavate. Rostellum erect, toothed. Peristylus goodyeroides. Dalz. & Gibs. p. 270. Habenaria goodyeroides, Grah. Cat. Bo. Pl. (1839) p. 201 (not of Don); Hook. f. Fl. B. I. v. 6, p. 161; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520. H. goodyeroides var. affinis, King & Pantling, in Ann. Roy. Bot. Gard. Calc. v. 8 (1898) p. 327, t. 430 bis. II. affinis, Don, Prodr. Fl. Nep. (1825) p. 25 (not of Wight).—Flowers: Aug.

Konkan: Nimmo!, Dalzell!; S. Konkan, Dalzell & Gibson.—Distrib. India (Nepal, Khasia Hills, Naga Hills, Sikkim, W. Peninsula).

5. Peristylus Lawii, Wight, Icon. v. 5, part 1 (1852) p. 12, t. 1695. Stem 6-12 in. high with loose sheaths below the leaves. Leaves 3-5 from about the middle of the stem, membrauous, not reduced to bract-like leaves above, $2\frac{1}{2}$ -4 by $\frac{3}{3}$ - $1\frac{1}{2}$ in., oblong lanceolate, acute, sheathing at the base. Flowers small, yellow, in narrow strict slender lax spikes 2-3 in. long; bracts $\frac{5}{5}$ in. long or more, exceeding the ovary, lanceolate, acuminate. Sepals 1-nerved; lateral sepals $\frac{1}{5}$ by $\frac{1}{15}$ in., oblong, obtuse; dorsal sepal $\frac{1}{5}$ by $\frac{1}{10}$ in., oblong, obtuse, concave. Petals $\frac{1}{5}$ by $\frac{1}{16}$ in., oblong, obtuse, concave claw, shortly 3-lobed at the apex; lobes $\frac{1}{30}$ in. long, subequal, obtuse, the 2 lateral lobes rounded on the outer edge, slightly curved, the midlobe straight; spur short, scrotiform, $\frac{1}{20}$ in. long. Anther-tubes 0; pollinia clavate; caudicle 0; glands small. Stigmatic processes very short, clavate. Rostellum short, triangular, neute. Dalz. & Gibs. p. 270; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1898) p. 510. Habenaria Lawii, Hook. f. Fl. B. I. v. 6 (1890) p. 162; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; Prain, Beng. Pl. p. 1032.—Flowers: Aug.

Konkan: Dalzell!, Law!; Noral below Matheran, Bhiva! S. M. Country: Belgaum, Law!; near Dharwar, Law ex Stocks, 73!—Distrib. India (Bengal, Behar, W. Peninsula).

30. PLATANTHERA, Rich.

Terrestrial herbs. Tubers ovoid-globose, rarely lobed. Flowers small or large, in lax or dense spikes or racemes; bracts mostly narrow. Sepals unequal, free; lateral more or less spreading or reflexed. Petals simple, usually narrower than the dorsal sepal and appressed to it forming a hood. Lip continuous with the column, sometimes shortly adnate to it, produced at the base into a short or elongate spur, entire or 3-lobed; side lobes sometimes fimbriate or pectinate. Column short, footless; clinandrium erect, short, or scarcely as long as the anther. Anther-cells parallel or divergent; apex inferior, short and

adnate to the side lobes of the rostellum; pollinia granular, with short caudicles and exserted naked glands; staminodes lateral, small, rounded or auriculate. Stigmas sessile or subsessile, more or less confluent, often pulvinate. Rostellum 3-lobed; middle lobe subulate or tooth-like, situated between the anther-cells; side lobes short. Capsule ellipsoid or oblong.—Distrib. Throughout the N. temperate regions and in the tropics of Asia and Africa, chiefly in the mountains; species 60 or 70.

I have followed Kraenzlin in rehabilitating this genus, a course which has been followed in Dyer's recently published 'Flora of Tropical Africa.' It is distinguished from Habenaria by the short, more or less confluent stigmas.

1. Platanthera Susannæ, Lindl. Gen. & Sp. Orchid. (1835) p. 295. A tall stout herb 2-4 ft. high; stem leafy up to the inflorescence. Leaves 2-6 by 1-2 in., ovate-oblong or oblong-lanceolate, imbricating, acute or acuminate, the upper sheathing, becoming smaller and passing into large leafy bracts above. Flowers white, fragrant, very shortly pedicellate, in 3-6-flowered racemes; bracts leafy, $2\frac{1}{2}$ -3 in. long. Lateral sepals $1\frac{1}{2}$ by $\frac{3}{4}$ in., obliquely subquadrately oblong, ascending; dorsal sepal $1\frac{1}{4}$ in. long and as broad as long, broadly rhomboid, spreading. Petals $1\frac{1}{4}$ by $\frac{1}{6}$ in., linear, acute. Lip $1\frac{1}{2}$ in. long; side lobes $1\frac{1}{2}$ in. long, truncate, the outer margins pectinate in the middle; midlobe $1\frac{1}{4}$ by $\frac{1}{4}$ in., linear or dilated downwards; spur 4 in. long, more than twice as long as the ovary. Anther very broad and large; pollinia linear, about as long as their caudicle. Capsules together with pedicels 2 in. long, ellipsoid, beaked; pedicels stout, $\frac{1}{4}$ in. long. Dalz. & Gibs. p. 269; Wight, Icon. t. 920; Kraenzlin, Orchid. Gen. et Sp. v. I (1898) p. 601. Habenaria Susannæ, R. Br. Prodr. (1810) p. 312; Hook. f. Fl. B. I. v. 6 (1890) p. 137; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519; Prain, Beng. Pl. p. 1030. H. gigantea, Don, Prodr. Fl. Nep. (1825) p. 24; Grah. Cat. p. 201.—Flowers: Sept. Vern. Wagchora.

KONKAN: Matheran, Cooke!, H. M. Birdwood. DECCAN: Khandala, Stocks, 7!, Cooke!, Graham, Woodrow; Mahableshwar, Cooke! S. M. Country: Belgaum, Ritchie, 1395!—DISTRIB. India (Khasia, Naga and Manipur Hills, Birma, Hills of the Western Peninsula); Ohina, Malay Islands.

31. HABENARIA, Willd.

Terrestrial usually leafy herbs with undivided or lobed tubers. Leaves flat with sheathing bases. Flowers spicate or racemose, usually green or yellow, or the sepals green and the petals white; bracts mostly Sepals unequal; lateral sepals more or less spreading or Petals simple or 2-lobed or 2-partite (very rarely 3-partite), the segments usually filiform, equal or unequal. Lip continuous with the column, often shortly adnate to it, produced at the base into a short or elongated spur; limb spreading or pendulous, narrow or broad, undivided, or 3-lobed, or 3-partite. Column continuous with the ovary, not reclinate, short, footless; anther-cells parallel or diverging, forming with the side arms of the rostellum channels or tubes for the caudicles of the pollinia; pollinia granular, with short elongate caudicles and an exserted naked gland; stigma 2-lobed or extended into 2 short or elongate often clavate papillose processes; rostellum 3-lobed, the midlobe narrowly triangular, hidden between the anther-cells. Capsule ellipsoid or oblong, sometimes beaked .- DISTRIB. Species about 400, widely diffused through tropical and subtropical regions.

Petals 2-partite; lip 3-lobed or 3-partite.		4
Sepals with filiform tips	1.	H. stenopetala.
Sepals acute but not filiform at the tips.		
Lower segment of petals shorter than the upper;		
pedicels very short or 0; stem leafy upwards Lower segment of petals longer than the upper;	2.	H. digitata.
Lower segment of petals longer than the upper;		
pedicels long; stem with leaves at the base only.		
Leaves more than one, linear, oblong or lanceo-		
late, narrowed and sheathing at the base;		
upper segment of petals longer than broad	3.	H. rariflora.
Leaf solitary, subrotund; upper segment of petals		,
as broad as long	4.	H. grandiflora.
Petals entire.		,
Side lobes of lip petaloid, broader than the midlobe.		
Lip deeply 3-lobed or 3-partite, not or hardly longer		
than the lateral sepals.		
Side lobes of lip small, rounded	5.	H. platyphylla.
Side lobes of lip large, obliquely truncate and		
denticulate at the apex	6.	H. suaveolens.
Lip deeply 3-lobed or 3-partite, much longer than the		
luteral sepals.		
Lobes of lip with long filiform tails	7.	H. crinifera.
Lobes of lip not tailed.	-	•
Spur reaching 4 in. long; lateral sepals 1 in.		
long	8.	H. longecalcarata.
Spur II in. long; lateral sepals I in. long		H. plantaginea.
edablim, with eacht repared tear oil, to redul, while		
Tubes of the anther-cells long; lateral sepals very		
gibbous with many arched nerves; stem leafy		
upwards	10.	H. commelinifolia.
Tubes of the anther-cells short.		
Stem leafy upwards.		•
Bracts large, cucullate; flowers secund.		
Leaves 1 in. long; spur subacute; flowers		
greenish-vellow	11.	II, Heyneana.
Leaves 2 in. long; spur subobtuse; flowers		
	12.	H, subpubens,
Leaves 3-6, clustered towards the middle or at the		•
base of the stem.		
Bracts as long as or longer than the ovary;		
lateral segments of lip narrower than the		
central linear segment.		
Spur not longer than the ovary; lateral		
segments of lip slender but not filiform,		
scarcely or not longer than the midlobe.		
Spur slender, incurved; leaves green		
throughout, placed near the middle		
of the stem	13.	H. affinis.
Spur stout, clavate; leaves with nar-		•
row yellowish margins, placed near		
the base of the stem	14.	H. marginata.
Bracis much shorter than the ovary; spur		٠.
slightly exceeding the ovary, thickened		
below; leaves green throughout, placed		
near the base of the stem	15.	H. viridiflora vo
		Dalzellii.
Leaves 2 (rarely 3), radical or opposite on the		
stem, broadly ovate or suborbicular, cordate at		
the base.		
Plant 8-18 in. high; bracts 1-3 in. long;		
lateral lobes of lip shorter than the mid-		
lobo	16.	H. crassifolia.
Plant 4-10 in. high; bracts 1 in. long; lateral		
lobes of lip longer than the midlobe	17.	H. diphylla.

1. Habenaria stenopetala, Lindl. Gen. & Sp. Orchid. (1835) p. 319 (not p. 324). Stem 1-2 ft. high, stout, the lower portion clothed with closely appressed sheaths. Leaves in the middle part of the stem. 3-8 by 1-2 in., membranous, oblong-lanceolate or ovate-lanceolate, acute, the margins undulate, base narrowed or broad, amplexicaul or sheathing, the upper part of the stem between the leaves and the raceme with lanceolate acuminate bract-like leaves much smaller than those of the middle stem. Flowers arranged in many-flowered racemes 3-6 in. long, variable in size, the sepals and petals greenish, the lip brown; floral bracts lanceolate, acuminate, about as long as the slender stalked ovary. Sepals subequal; lateral sepals $\frac{3}{8} - \frac{1}{2}$ in. long, reaching 1/6 in. broad, oblong-lanceolate, somewhat oblique, strongly 3-nerved, and with a long filiform apical tail; dorsal sepal similar. Petals shorter than the sepals, 2-partite, the segments linear, acute, usually unequal. Lip 3-partite, the segments variable, the lateral segments sometimes as long as the middle one but usually shorter than it; spur as long as or longer than the ovary, 2-ridged, slender, turned upwards. Column stout; anther-cells rather distant, parallel, narrow, erect, their tubes long; pollinia oblong; caudicles slender, twice as long as the pollinia; glands minute. Staminodes ovate, rugulose, situated externally to the anther-cell and stigma on each side. Stigmas 2, oblong, with slightly divergent blunt apices, situated below the authers and at the margins of the mouth of the spur. Capsules linear-oblong, ½-2 in. long. Fl. B. I. v. 6, p. 134; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 358; King & Pantling, in Ann. Roy. Bot. Gard. Calc. v. 8 (1898) p. 308, t. 404; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519; Prain, Beng. Pl. p. 1030. ? Habenaria modesta, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 262; Dalz. & Gibs. p. 267.

Rare. Konkan: Dalzell!, Law!, Stocks, 64! S. M. Country: Párva Ghát, Dalzell, 15!-Distrib. India (Upper Assam, Bengal, W. Peninsula).

2. Habenaria digitata, Lindl. Gen. & Sp. Orchid. (1835) p. 307. Stem 1-2 ft. high, leafy, the lower part with closely appressed sheaths. Leaves variable, $2-4\frac{1}{2}$ by $\frac{3}{4}-1\frac{1}{4}$ in., ovate-oblong, acute or acuminate, sheathing at the base. Flowers greenish-white, in cylindric, manyflowered, rather lax racemes; bracts large, lanceolate, acute, often foliaceous; pedicels very short. Sepals greenish-white; lateral sepals ½ by ¼ in., ovate, acute, subfalcate, spreading; dorsal sepal ½ by ⅓ in., broadly elliptic or suborbicular, obtuse, 3-nerved. Petals 2-partite; upper segment ½ by 10 in., subfalcate, acute, 3-nerved; lower segment shorter; narrowly linear, acute, the segments separated by a rather wide Lip 3-partite, the segments linear, the lateral usually shorter than the middle one, which is about 1 in. long; spur reaching 3 in. long, equalling the ovary or nearly so, subclavate at the tip, with an erect ligule at the mouth. Stigmatic processes clavate-oblong, appressed to the lip. Anther-cells parallel, the tubes upcurved; rostellum shorter than the anther, obtusely triangular. Fl. B. I. v. 6, p. 134; Dalz. & Gibs. p. 267; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 270; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519; Prain, Beng. Pl. p. 1030. Habenaria Gibsoni, Hook. f. Fl. B. I. v. 6 (1890) p. 135; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519. H. trinervia, Wight, Icon. v. 5, part 1 (1852) p. 12, t. 1701.—Flowers: July.

Konkan: Stocks!, Law!; Island of Karanja, Dalzell & Gibson. Deccan: Lanoli, Woodrow; Khandala, Cooke!, Bhiva!, Woodrow; Purandhar, Dr. Barnes! Karara: Law!—Distrin. India (Kashmir, Assam, Silhet, Bengal, Tenasserim, W. Peninsula).

Var. foliosa, Hook. f. Fl. B. I. v. 6 (1890) p. 135. A smaller plant 6-12 in. high, all its parts smaller. Leaves 2 by 1 in. Racemes dense-flowered. Lateral sepals $\frac{1}{16}$ by $\frac{1}{6}$ in.; dorsal sepal $\frac{1}{4}$ by $\frac{1}{6}$ in. Upper segment of petals $\frac{1}{3}$ by $\frac{1}{20}$ in. Lip $\frac{2}{5}$ in. long; spur $\frac{2}{5}$ in. long. Habenaria foliosa (sp.), A. Rich. in Ann. Sc. Nat. sér. 2, v. 15 (1841) p. 71; Dalz. & Gibs. p. 267; Wight, Icon. t. 1700; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 273. H. laciniata, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 261.—Flowers: July.

Rare in the Bombay Presidency. I have only seen 1 specimen collected on the hills about Kadukvasla near Poona; there are no specimens in Horb. Kew. Dalzell & Gubson mention the occurrence of the plant in Salsette, but there are no specimens in Dalzell's herbarium. I have followed Sir J. Hooker in making the plant a variety of H. digitata, from which it differs chiefly in the size of all its parts. Kraenzlin (l. c) restores it to specific rank. In his claus (p. 261) Kraenzlin gives as a distinguishing character the lengths of the petal-segments, which in the key he declares to be equal. In his description, however (p. 273), he describes the lower segments as shorter than the upper, which is correct.

3. Habenaria rariflora, A. Rich. in Ann. Sc. Nat. sér. 2, v. 15 (1841) p. 70, t. 2, D. Whole plant 2-10 in. high. Leaves radical or subradical, variable, $2\frac{1}{2}$ -4 by $\frac{2}{3}$ -1 in., linear-oblong or lanceolate, acute, sometimes complicate. Flowers white, 1-3 in short racemes; bracts ovate, acuminate, 5-1 in. long; pedicels erect, about as long as the ovary and together with it reaching sometimes 2 in. long. 5-nerved; lateral sepals rather more than $\frac{3}{8}$ in. long by $\frac{1}{8}$ in. broad, ovate-oblong, acute, subfalcate; dorsal sepal $\frac{3}{8}$ by $\frac{1}{4}$ in., broadly ovate, subacute. Petals 2-partite; upper segments 1 by 1 in., ovate, acuminate, oblique, 3-4-nerved; lower segments longer than the upper, linear, acute. Lip 1 in. long, 3-partite; lateral segments filiform, longer than the broader linear obtuse middle one; spur longer than the ovary, often exceeding 2 in. in length, upcurved. Anther large, apiculate, the cells parallel, the tubes short, upcurved; glands of pollinia orbicular; rostellum erect, slender. Stigmatic processes clavate. Fl. B. I. v. 6, p. 136; Dalz. & Gibs. p. 268; Wight, Icon. t. 924; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 271; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519. Habenaria uniflora, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 344.—Flowers: July-Aug.

KONKAN: Stocks!, Law!, Dalzell! DECOAN: Panchgani, Cooke!; Karkala (near Poona), Woodrow; Purandhar, Dr. Barnes!, Woodrow.—Distrib. India (W. Peninsula).

4. Habenaria grandiflora, Lindl. in Wall. Cat. (1828) 7032. Whole plant 3-8 in. high. Leaf radical, solitary, 1-2 in. long and as broad or nearly as broad as long, broadly ovate or suborbicular, often acute or apiculate at the apex, base cordate; petiole 0. Flowers white, in 1-4-flowered lax racemes; scape with one or two sheaths, together with the raceme 3-8 in. high; bracts ½ in. or more long, ovate, acuminate; pedicels about as long as the ovary, both together 1-2 in. long. Lateral sepals ½ by ½ in., obliquely ovate, acute, 7-nerved; dorsal sepal ½ by ½ in., ovate, cucullate, obtuse, apiculate. Petals 2-partite; upper segment very broad, ½ by ¼ in., obliquely ovate or suborbicular; lower segment ½ in. long, filiform. Lip ½ in. long, 3-partite.

the segments subequal; lateral segments filiform; middle segment $\frac{1}{16}$ in. broad, linear-lanceolate, acute; spur $\frac{3}{4}$ in. long, curved, longer than the ovary, clavate at the tip. Anther 3-cuspidate, the cells parallel, the tubes rather short, broad, spreading; gland of pollinia large, orbicular. Stigmatic processes large, clavate. Rostellum elongate, erect. Fl. B. I. v. 6, p. 136; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 337; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 519. Habenaria rotundifolia, Lindl. Gen. & Sp. Orchid. (1835) p. 306; Dalz. & Gibs. p. 267.—Flowers: July.

Konkan: Stocks!, Law! Deccan: Máwal (Poona districts), Stocks!; Shiyapur, Cooke!; Mahableshwar, Cooke!, Stocks!, H. M. Birdwood; Sinhagad (near Poona), Woodrow; Purandhar, Woodrow. S. M. Country: Belgaum, Stocks!—Distrib. India (W. Peninsula).

The tubers furnish the Salep misri of Indian bazaars.

5. Habenaria platyphylla, Spreng. Syst. Veg. v. 3 (1826) p. 690. Whole plant 6-18 in. high. Leaves 3-6, lying flat on the ground, fleshy, 2-4 in. long and as broad or nearly as broad as long, sessile, orbicular or elliptic. Flowers white, fragrant, in dense-flowered short spikes; scape together with spike 6-18 in. long, the scape with numerous erect lanceolate-subulate sheaths up to the spike; bracts lanceolate, acute, shorter than the long-beaked ovary. Lateral sepals & by & in., obliquely ovate, obtuse; dorsal sepal rather more than 1 in. long by $\frac{1}{5}$ in. wide, broadly elliptic, obtuse. Petals $\frac{1}{5}$ by $\frac{1}{15}$ in., linear, subacute. Ovary 1 in. long with a slender beak as long as the body. Lip nearly $\frac{1}{3}$ in. long, veined; side lobes $\frac{1}{10}$ by $\frac{1}{10}$ in., rounded; midlobe $\frac{1}{5}$ in. long, triangular, acute; spur 13-12 in. long, clavate at the apex, the mouth funnel-shaped, with a short tooth. Anther-cells divergent; tubes long; glands of the pollinia small. Stigmatic processes subglobose. tellum short, triangular. Fl. B. I. v. 6, p. 140; Grah. Cat. p. 201; Wight, Icon. t. 1709; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 411; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520.—Flowers: Aug.-Sept.

KONRAN: Dalzell!, Stocks!, Law! S. M. COUNTRY: Belgaum, Ritchie, 76!; Dharwar, Woodrow,—Distrib. India (W. Peninsula).

6. Habenaria suaveolens, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 263. Whole plant 8-12 in. high; stem short, clothed at the base below the leaves with a few old sheaths. Leaves 3-5, arising about 1 in. or so above the ground, 3-6 by \(\frac{1}{4}\)-\frac{8}{6}\) in., linear-oblong or linear-lanceolate, acute or acuminate. Flowers fragrant, in few-flowered secund lax racemes; bracts \(\frac{1}{2}\)-\frac{2}{4}\) in. long, ovate-lanceolate, finely acuminate, exceeding the very shortly pedicellate ovary; peduncles with raceme 4-10 in. long. Lateral sepals \(\frac{1}{3}\) by \(\frac{1}{6}\) in., triangular-oblong, acute, subfalcate; dorsal sepal \(\frac{1}{3}\) by \(\frac{1}{6}\) in., ovate, acute. Lip \(\frac{3}{6}\) in. long; side lobes \(\frac{1}{6}\) in. broad, obliquely truncate and denticulate at the apex; midlobe a little longer than the side lobes, \(\frac{1}{10}\) in. broad, linear-spathulate, acute; spur \(\frac{3}{6}\) in. long, about equalling the ovary, subclavate at the apex. Anther-tubes 0; pollinia clavate, as long as their stout caudicles; glands large, orbicular. Stigmatic processes very short. Fl. B. I. v. 6, p. 140; Dalz. & Gibs. p. 268; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 416; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520.

Konkan: Dalzell!; between Vingorla and Malwan, rare, Dalzell & Gibson, Woodrow.—Distrib. India (W. Peninsula).

7. Habenaria crinifera, Lindl. Gen. & Sp. Orchid. (1835) p. 323. Whole plant 3-18 in. high; stem short, leafy near the base. Leaves 2-6 by $\frac{3}{8}-1\frac{1}{2}$ in., oblong-lanceolate, acuminate, spreading, broadly sheathing below. Flowers in short racemes 2-3 in. long; peduncles 2-15 in. long, with large distant lanceolate-subulate sheaths; bracts. reaching 1 in. long, ovate-lanceolate, acuminate; ovary beaked, together with beak and pedicel reaching 1 in. long. Sepals greenish; lateral sepals 1 by 1 in., obliquely ovate, subacute; dorsal sepal 1 in. long and nearly as broad as long, orbicular-ovate, acute. Petals white, erect. linear, acute. Lip white, 3 times as long as the sepals, with a long claw, 3-lobed; side lobes cuneiform, the outer margin toothed and with a slender tail as long as itself produced from the inner margin; midlobe clawed, cleft into 2 lanceolate long-tailed segments as long as the side lobes; spur 11-11 in. long, slender, incurved, the mouth with a strong ligule. Anther-tubes long, straight; caudicles of pollinia winged; glands very small. Stigmatic processes clavate, adnate to the mouth of the spur. Rostellum very short, obtuse. Capsules 1-12 in. long, fusiform, with a slender beak. Fl. B. I. v. 6, p. 142; Dalz. & Gibs. p. 269; Wight, Icon. t. 926; Trim. Fl. Ceyl. v. 4, p. 229; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 424. Habenaria schizochilus, Grah. Cat. Bo. Pl. (1839) p. 252.

Not common. Konkan: Vingorla, Dalzell & Gibson, Woodrow. S. M. Country: Ramghat, Law ex Graham, Dalzell ex Stocks, 5!—Distrib. India (W. Peninsula).

8. Habenaria longecalcarata, A. Rich. in Ann. Sc. Nat. ser. 2, v. 15 (1841) p. 71, t. 3, B. Whole plant 12-20 in. high or even more: stem short, leafy near the base. Leaves 3-5, oblong or oblong-lanceolate, variable in size, 13-4 by 3-11 in. Flowers white, jasmine-scented, few (1-4), in short lax racemes; bracts 1 in. long, convolute round the pedicels, acute; pedicels in fruit reaching 11 in. long. Lateral sepals by 4 in., obliquely ovate, subacute; dorsal sepal 76 by 4 in., elliptic, obtuse. Petals exceeding in long, oblong, subfalcate, subobtuse. Lip 3 in, long or longer, with a claw 1 by 1 in.; 3-lobed beyond the claw; side lobes $\frac{5}{5}$ in. long by $\frac{1}{10}$ in. broad at the base, linear, becoming broader outwards, obliquely cut to a fine point at the apex and toothed on the outside; midlobe $\frac{3}{8}$ by $\frac{1}{10}$ in., linear, acute; spur often reaching 4 in. long, thickened from below the middle towards the tip. Anther-tubes long, slender; pollinia narrowly pyriform, shorter than the caudicles, which are narrowly winged on one side. Stigmatic processes thick, surrounding the mouth of the spur. Rostellum obscure. Fl. B. I. v. 6, p. 141; Dalz. & Gibs. p. 268; Wight, Icon. t. 925; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 418; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520. Habenaria longicorniculata, Grah. Cat. Bo. Pl. (1839) p. 202.—Flowers: Sept.-Oct.

Konkan: Nimmo ex Graham, Jacquemont, 598!; common on the Ghâts, Stocks, 22! Deccan: Woodrow; Purandhar, Kanitkar!; Bhor Ghât, Cooke!; Khandala, Cooke!, Woodrow, Graham. S. M. Country: near Belgaum, abundant, Dalzell & Gibson.—Distrib. India (W. Peninsula).

9. Habenaria plantaginea, Lindl. Gen. & Sp. Orchid. (1835) p. 323. A slender herb 8-12 in. high; tubers oblong. Leaves radical,

3-6 by $\frac{3}{4}-1\frac{1}{2}$ in., elliptic or elliptic-oblong, acute, spreading, membranous. narrowed at the base into a short sheath. Flowers pure white, subsecund, in lax spikes 3-5 in. long; scapes 5-6 in. long, with many distant open lanceolate acuminate sheaths $\frac{1}{2}$ -1 in. long; bracts $\frac{3}{8}$ - $\frac{1}{2}$ in. long, ovate-lanceolate, finely acuminate, much shorter than the beaked ovary. Sepals strongly 3-nerved; lateral sepals $\frac{1}{5}$ by $\frac{1}{10}$ in., falcately oblong, subacute; dorsal sepal $\frac{1}{5}$ by $\frac{1}{6}$ in., ovate-oblong. Petals $\frac{1}{6}$ by $\frac{1}{20}$ in., linear-lanceolate, acute. Lip $\frac{1}{16}$ in. long by about $\frac{3}{6}$ in broad, flabelliform from a narrow claw, many-nerved, 3-lobed, puberulous; lateral lobes half-ovate, \(\frac{1}{4}\) by \(\frac{1}{6}\) in., subacute; midlobe nearly but not quite as long and only half as broad as the lateral, linear, acute; spur $1\frac{1}{4}$ in. long, equal to or longer than the ovary, pendulous. Anther-tubes short, upcurved; pollinia pyriform, as long as their broad caudicles, which are inserted upon an (at first apparently simple) entire lanceolate concave gland, which afterwards divides longitudinally, each pollinia carrying away one half. Stigmatic processes large, clavate. Rostellum triangular, broad. Capsule \(\frac{2}{3} \) in. long, turgidly fusiform, curved, with a short slender beak. Fl. B. I. v. 6, p. 141; Wight, Icon. t. 1710; Trim. Fl. Ceyl. v. 4, p. 229; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 413; Prain, Beng. Pl. p. 1030.—Flowers: Mar.-Apr.

Konkan: Dalzell!; Matheran, H. M. Birdwood. Deccan: Ambenala Ghát near Lanoli, Kanitkar!—Distrib. India (Subtropical Himalaya, Behar, Central India, W. Peninsula); Ceylon.

10. Habenaria commelinifolia, Wall. ex Lindl. Gen. & Sp. Orchid. (1835) p. 325. Stem 2-3 ft. high, with sheaths at the base, leafy upwards, the leaves becoming gradually smaller, passing into lanceolate caudate-acuminate bract-like sheaths below the spike; tubers ellipsoid. Leaves 3-6 by $\frac{3}{4}$ - $1\frac{1}{4}$ in., oblong or oblong-lanceolate, flat, sheathing at the base. Flowers sessile, white, inodorous, in spikes 4-8 in. long; bracts 1 in. long, lanceolate, produced to a fine acicular point, exceeding the body of the ovary without the beak. Lateral sepals nearly 1/2 in. long, very gibbous, hatchet-shaped, beaked, with many arched nerves; dorsal sepal 3 in. long, orbicular, shortly beaked, hooded. Petals \(\frac{1}{3}\) by \(\frac{1}{5}\) in., obliquely ovate-oblong, obtuse. Lip linear for about $\frac{1}{5}$ in. from the base, $\frac{1}{10}$ in. broad, then divided into 3 segments, of which the lateral are filiform and exceed 1 in. long, the middle segment $\frac{5}{8}$ by $\frac{1}{10}$ in., linear, shorter than the lateral; spur $1\frac{1}{2}-2\frac{1}{2}$ in. long, incurved, green, with a funnel-shaped mouth. Anther-tubes long, straight, erect. Stigmatic processes large, clavate, incurved. Rostellum short, triangular. Capsules sessile, fusiform, $1\frac{1}{2}$ in. long including the curved beak which is twice as long as the body of the capsule. Fl. B. I. v. 6, p. 143; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 322; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; Prain, Beng. Pl. p. 1031. Orchis commelinifolia, Roxb. Fl. Ind. v. 3 (1832) p. 451; Grah. Cat. p. 201 .-Flowers: Sept.

Konkan: Stocks!, Law!, Dalzell!; S. Konkan in pasture-lands, Graham. Deccan: Khandala, Woodrow. — Distrib. India (Tropical W. Himalaya, Bengal, Birma, W. Peninsula).

11. Habenaria Heyneana, Lindl. Gen. & Sp. Orchid. (1835) p. 320. Whole plant scarcely reaching 10 in. high; stem stout, leafy.

Leaves turning black in drying, subimbricate, $1-1\frac{1}{2}$ by $\frac{1}{4}-\frac{5}{6}$ in., sheathing, ovate, acute, eract or recurved, soon reduced upwards to smaller bractlike leaves. Flowers greenish-yellow, few, secund, in terminal spikes; bracts imbricating, the lower reaching 1 in., the upper $\frac{3}{4}$ in. long, ovate, finely acuminate, cucullate, exceeding the flowers. Lateral sepals $\frac{1}{4}$ by $\frac{1}{15}$ in., obliquely ovate, straight on the upper, rounded on the lower edge, obtuse or subacute; dorsal sepal $\frac{1}{4}$ by $\frac{1}{5}$ in., ovate, subobtuse. Petals $\frac{1}{3}$ by $\frac{1}{25}$ in., linear, acute, falcate. Lip thick, $\frac{1}{4}$ in. long, 3-lobed at the apex, with a basal claw $\frac{1}{16}$ by $\frac{1}{16}$ in.; side lobes $\frac{1}{10}$ by $\frac{3}{10}$, linear, subacute; midlobe oblong, rounded at the apex, $\frac{1}{5}$ by $\frac{1}{12}$ in.; spur $\frac{3}{5}$ in. long, subclavate at the tip, shorter than the sessile not beaked ovary. Anther-tubes 0; caudicles of pollinia very short, stout; gland large, orbicular. Stigmatic processes large, spreading, clavate. Rostellum short, triangular, acute. Fl. B. I. v. 6, p. 148; Dalz. & Gibs. p. 268; Wight, Icon. t. 923; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 375; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520.—Flowers: Aug.—Sept.

Konran: Law!, Dalzell!; S. Konkan, Dalzell ex Stocks, 78!; Southern Gháis, Stocks, 12!; Wari country, Dalzell & Gibson. Deccar: Stocks, 60!; Lanoli, Woodrow. Kanara: Sirsi, Dalzell!—Distrib. India (W. Peninsula).

12. Habenaria subpubens, A. Rich. in Ann. Sc. Nat. sér. 2, v. 15 (1841) p. 75, t. 4, C. Whole plant 6-12 in. high; stem slender, leafy. Leaves 2 by \(\frac{3}{6}\) in., smaller upwards and passing into bracts, sheathing at the base, linear-lanceolate, acute, apiculate. Flowers white, secund, pedicellate, in slender racemes \(\frac{1}{2}\)-4 in. long; bracts \(\frac{1}{2}\)-\frac{3}{6}\) in. long, ovate-lanceolate, acute, apiculate, cucullate; pedicels with ovary \(\frac{5}{6}\) in. long. Lateral sepals \(\frac{1}{4}\) by \(\frac{1}{12}\) in., oblong, acute; dorsal sepal \(\frac{1}{4}\) by \(\frac{1}{4}\) in., ovate, obtuse. Petals \(\frac{1}{4}\) by \(\frac{1}{10}\) in., falcate. Lip \(\frac{1}{4}\) in. long with a claw \(\frac{1}{16}\) by \(\frac{1}{16}\) in., 3-lobed beyond the claw; side lobes linear, subfalcate, \(\frac{1}{25}\) in. broad, rather shorter than the midlobe; midlobe \(\frac{1}{12}\) in. broad, fleshy, elliptic, subobtuse; spur \(\frac{3}{6}\) in. long, linear, subobtuse. Anther apiculate. Stigmatic processes adnate to the claw. Fl. B. I. v. 6, p. 148; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 361; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520. Habenaria candida, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 262; Dalz. & Gibs. p. 267. Scarcely distinct from H. Heyneana.

KONKAN: Dalzell!; S. Konkan, Dalzell & Gibson. Decean: Karli near Khandala, Jacquemont, 619! S. M. Country: Dharwar, Law ex Stocks, 79!—Distrib. India (W. Peninsula).

13. Habenaria affinis, Wight, Icon. v. 5, part 1 (1852) p. 13, t. 1707 (not of Don). Stem stout, 1-2 ft. high, with several sheaths at the base. Leaves 3-6, clustered near the middle of the stem, 4-6 by 1-2 in., elliptic-lanceolate, acuminate, sheathing at the base. Flowers in long cylindric racemes 6 in. or more long; peduncle of raceme bearing several lanceolate finely acuminate sheaths above the leaves; bracts \(\frac{1}{2} \) in. long, ovate-lanceolate, caudate-acuminate, longer than the curved, very shortly pedicellate, shortly beaked ovary. Lateral sepals \(\frac{1}{2} \) by \(\frac{1}{12} \) in., oblong-lanceolate, acute; dorsal sepal \(\frac{1}{2} \) by \(\frac{1}{12} \) in., ovate, acute. Petals \(\frac{1}{2} \) in. long, similar to the lateral sepals. Lip with a claw \(\frac{1}{2} \) in. long and broad, 3-lobed beyond the claw; side lobes \(\frac{1}{2} \) in. long by

10 in. broad at base, tapering to a five point; midlobe nearly 1/4 in. long by 1/16 in wide, linear, subacute; spur 1/3 in. long, slender, much curved, acute. Anther-tubes shortly upcurved. Stigmatic processes large, clavate. Fl. B. I. v. 6, p. 149; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 324; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; Prain, Beng. Pl. p. 1031.

DECCAN: Purandhar, Woodrow. S. M. COUNTRY, Belgaum, Ritchie, 17!—DISTRIB. India (Bengal, Central India, W. Peninsula).

14. Habenaria marginata, Coleb. in Hook. Exot. Fl. (1825) t. 136. Whole plant 4-10 in. high. Leaves few (often 3), subradical, sessile, 2-4 by ½-1 in., oblong, obtuse, with yellow or white margins, reduced upwards to lanceolate finely acuminate sheaths \frac{1}{2}-1 in. long. Flowers yellow, sessile, numerous, in cylindric spikes 1½-3 in. long; bracts $\frac{1}{2}$ in. long, ovate-lanceolate, finely acuminate, about equalling the sessile ovary. Sepals 5-nerved; lateral sepals rather less than 1 in. long and 1 in. broad, obliquely oblong, acute; dorsal sepal 1 by 1 in., broadly ovate, acute, cucullate. Petals \frac{1}{5} in. long, oblong-lanceolate. acute, falcate from a broad base, closely appressed to the dorsal sepal. Lip nearly $\frac{1}{2}$ in. long, with a claw $\frac{1}{20}$ in. long and broad, 3-lobed beyond the claw; side lobes acute, 1-nerved; midlobe rather more than \frac{1}{4} in. long, and 15 in. broad, lanceolate, subobtuse, 3-nerved; spur nearly in. long, stout, curved, clavate at the tip. Anther-tubes short, spreading, funnel-shaped. Stigmatic processes elongate, adnate to the lip. Rostellum triangular, acute. Capsules 1 in. long, fusiform, turgid. curved, obscurely beaked. Fl. B. I. v. 6, p. 150; Grah. Cat. p. 201; Dalz. & Gibs. p. 268; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 360; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; Prain, Beng. Pl. p. 1031.—Flowers: Aug.

Konkan: Law!, Dalzell!; S. Konkan, Nimmo ex Graham, Stocks, 6!; Karanja, Dalzell & Gibson; Uran (island in Bombay Harbour), Dalzell! Deccan: Junnar near Poona, Dalzell & Gibson, Stocks, 59!; Purandhar, Woodrow.—Distrib. India (W. Himalaya, Behar, Bengal, Birma, W. Peninsula).

VAR. flavescens. A more slender plant; flowers fewer; ovary more distinctly beaked. Habenaria flavescens (sp.), Hook. f. Fl. B. I. v. 6 (1890) p. 150.

Konkan; Law!

There is but I sheet in Herb. Kew., the specimens on which seem to have been drawn up by growing in the shade. I can discover no characters which would entitle the plant to the rank of a species. Indeed Sir J. Hooker (l. c.) was of opinion that it was probably a form of *H. marginata*.

15. Habenaria viridiflora, R. Br. Van. Dalzellii, Hook. f. Fl. B. I. v. 6 (1890) p. 150. Whole plant 4-14 in. high; stem below the leaves very short. Leaves 3-5, arising near the base of the stem, 1-3 by $\frac{1}{16} - \frac{5}{16}$ in., linear, acute or acuminate, often apiculate. Flowers yellow, in many-flowered rather lax racemes $1\frac{1}{2}$ -3 in. long, on long very slender wiry peduncles clothed with many ovate-lanceolate, finely acuminate sheaths; bracts $\frac{1}{6} - \frac{1}{6}$ in. long, shorter than the shortly pedicellate ovaries (which with the pedicels reach $\frac{1}{2}$ in. long), ovate-lanceolate, finely acuminate. Lateral sepals $\frac{1}{6}$ by $\frac{1}{12}$ in., obliquely ovate, subobtuse, strongly nerved; dorsal sepal $\frac{1}{10}$ by $\frac{1}{16}$ in., ovate, subacute. Petals $\frac{1}{8}$ by Vol. II.

 $\frac{1}{2}$ in., obliquely ovate, subobtuse. Lip $\frac{1}{4}$ in. long, 3-partite almost to the base; side lobes $\frac{1}{5}$ by $\frac{1}{35}$ in., linear, acuminate, recurved; midlobe shorter than the side lobes, $\frac{1}{35}$ in. broad, linear, subacute; spur $\frac{6}{3}$ in. long, slightly thickened towards the acute tip, incurved, exceeding the ovary. Anther-tubes short, upcurved; pollinia pyriform; caudicles short. Stigmatic processes long, clavate. Rostellum short, broad. Capsules together with pedicel exceeding $\frac{1}{2}$ in. long, fusiform, hardly beaked. Habenaria viridiflora, Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520 (not of Br.). Cologlossum luteum, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 263; Dalz. & Gibs. p. 269.—Flowers: Aug.

It is the above variety and not the type which seems to occur in the Bombay Presidency; at least this is the plant which is represented from that Presidency in Herb. Kew., and I have seen no others. It is

apparently a rare plant.

Dalzell without locality in Herb. Kew.! Konkan: Stocks, 36!; Málwan, Dalzell & Gibson.—Distrib. India (W. Peninsula).

16. Habenaria crassifolia, A. Rich, in Ann. Sc. Nat. sér. 2, v. 15 (1841) p. 72, t. 3, C. Whole plant 8-18 in, high. Leaves 2 or 3, radical, fleshy, variable in size and shape, 1-42 by 1-22 in., broadly ovate, acute, or suborbicular, or sometimes subreniform and broader than long, base cordate. Flowers white, in elongated many-flowered racemes 3-6 in. long; scape with many finely acuminate sheaths; bracts $\frac{1}{2}-\frac{3}{4}$ in. long, ovate-lanceolate, candate-acuminate; pedicels together with beaked ovary reaching nearly $\frac{3}{4}$ in. long. Sepals rather less than $\frac{1}{4}$ in. long by $\frac{1}{6}$ in. broad; lateral sepals oblong, obtuse, with 3 strong nerves and usually weaker ones; dorsal sepal elliptic, obtuse, with 3 very strong nerves. Petals $\frac{1}{6}$ by $\frac{1}{10}$ in., ovate, acute, with a strong midrib and 2 small weak lateral nerves. Lip $\frac{1}{5}$ in, long, 3-lobed; lobes linear-lanceolate, subacute, $\frac{1}{16}$ in. broad, the lateral lobes usually slightly shorter than the midlobe; spur \(\frac{2}{3} \) in. long, green. Anther-tubes short, spreading. Stigmatic processes short. Rostellum small, erect. Fl. B. J. v. 6, p. 151; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; Kraenzlin, Orchid. Gen. & Sp. v. 1 (1897) p. 344. Platanthera brachyphylla, Lindl. Gen. & Sp. Orchid. (1835) p. 293; Wight, Icon. t. 1694; Dalz. & Gibs. p. 269,—Flowers: Sept.

Konkan: Stocks!, Law! Deccan: Junnar Hill near Poona, Stocks, 771; Mahableshwar, Cooke!, Woodrow, H. M. Birdwood; Purandhar, Woodrow,—Distrib. India (W. Peninsula).

17. Habenaria diphylla, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 262. Whole plant 4-10 in high. Leaves 2, radical, pressing close on the ground, one of the pair usually smaller than the other, subfleshy, 1-2 in. in diam., orbicular with a short acumen, base cordate. Flowers greenish-white, in many-flowered racemes; scape with many ovate-lunceolate acuminate sheaths; bracts \(\frac{1}{4}\) in. long, ovate, acuminate, shorter than the ovary; pedicels together with ovary \(\frac{1}{3}-\frac{1}{2}\) in. long. Lateral sepals \(\frac{1}{10}\) by \(\frac{1}{4}\) in., ovate, acute, 3-nerved; dorsal sepal \(\frac{1}{4}\) by \(\frac{1}{4}\) in., broadly ovate, subacute, cucullate, somewhat obscurely nerved. Petals as long as the lateral sepals, \(\frac{1}{10}\) in. broad, linear, acute, subfalcate. Liplonger than the sepals, 3-partite; segments filiform, the lateral longer than the middle one; spur \(\frac{1}{2}\) in. long, inflated, acute. Anther-tubes

very short. Stigmatic processes elongate, clavate, adnate to the mouth of the spur. Rostellum obscure. Fl. B. I. v. 6, p. 151; Dalz. & Gibs. p. 268; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 346; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; Prain, Beng. Pl. p. 1031. Habenaria Jerdoniana, Wight, Icon. v. 5, part 1 (1852) p. 14, t. 1715. Liparis diphyllos, Nimmo, in Grah. Cat. (1839) p. 252.

Konkan: Stocks!, Dalzell!; S. Konkan, Nimmo, Dalzell & Gibson. Kanara: Law! -- Distrib. India (W. Himalaya, Dacca (C. B. Clarke), W. Peninsula).

IMPERFECTLY KNOWN SPECIES.

HABENARIA CARANJENSIS, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 262; Dalz. & Gibs. Bo. Fl. p. 267. Lower leaves somewhat rounded, upper oblong-lanceolate, 3-nerved; bracts acuminate, shorter than the ovary; upper sepal rounded; petals half-ovate, obtuse; lip tripartite; middle division oblong, rather obtuse; lateral ones shorter, cuneate, truncate; spur clavate, shorter than the ovary; flowers small, yellow.

The above is the description given by Dalzell in the 'Bombay Flora' of Dalzell and Gibson. There are no specimens in Herb. Kew. and the plant does not appear to have been collected by any other botanist than Dalzell. Fl. B. I. v. 6, p. 166; Kraenzlin, Orchid. Gen. et Sp. v. 1 (1897) p. 365.

ORDER CXXVI. SCITAMINEÆ.

Herbs often large, frequently with a pseudo-stem of convolute leafsheaths (rarely with a woody caudex). Leaves radical or cauline, usually membranous; sheaths generally large, clasping the stem; lamina with a stong central nerve and pinnate close secondary nerves; petioles short or 0. Flowers hermaphrodite, rarely 1-sexual (Musa), irregular, solitary or spicate; bracts membranous or herbaceous; bracteoles membranous or 0. Perianth 2-seriate, superior; outer segments 3, calycine (rarely petaloid), free and imbricate, or connate in an entire, toothed or spathaceous tube; inner segments petaloid, connate in a long or short corollatube free or adnate to the petaloid staminodes; limb 3-partite, the segments free or connate. Stamens only 1 perfect, the rest replaced by petaloid staminodes, or 5 perfect with a sixth imperfect or obsolete; anthers linear, 2-celled (rarely of one cell on the margin of a petaloid connective). Ovary 3 (rarely 1 or 2) -celled, inferior; ovules many (rarely few), anatropous, axile (rarely parietal); style usually slender, with 2 short stylodes, crowning the ovary; stigma usually entire or subentire. Fruit a loculicidally 3-valved capsule, or indehiscent and membranous or fleshy, usually crowned by the remains of the perianth. Seeds often arillate; albumen floury; embryo small .--DISTRIB. Genera about 50; species very many, throughout the warmer regions of both hemispheres.

Stamen only 1 perfect, the others reduced to staminodes or wanting. Author 2-colled; calyx tubular or spathaceous; style slender,

embraced below the stigma by the anther. Ovary 1-celled; placentas 3, parietal; corolla-tube long; flowers yellow 1. GLOBBA.

Ovary 3-celled; placentas axile.

Lateral staminodes broads Connective not spurred at the base; corolla-tube long, slender.

3 B 2

Filament short; connective broad, crested; stigma turbinate Filament long, complicate; connective broad,	- 2,	KEMPPERIA.
not created; stigua turbinate	3.	HITCHENIA.
narrow, not crested; stigma subglobose	4.	Hedremun.
Connective spurred at the base; corolla-tube funnel-shaped		CURCUMA.
adnate to the hp); corolla-tube cylindric.		
Flowers in dense cone-like spikes. Anther-cells divaricate, on a short arcuste		
filament, with or without a petaloid crest Anther-cells contiguous, parallel.	6.	Амочим.
Filament short; connective produced into a narrow appendage as long as		
the anther; stigma small, subglobose;		
spikes usually produced direct from the rootstock	7.	Zinginer,
Filament forming with the produced con- nective an oblong petaloid process		
with the contiguous linear anther- cells placed in its middle; stigma		
with a semilunar pit ciliato round the margin; spikes usually at the top of		
leafy stems, rarely produced direct from the rootstock		Costes.
Flowers in racemes or panicles at the top of leafy	o.	Costes,
stems; filament long; anther-cells divergent at the apex; stigma subglobose	9.	Alpinia.
Anther 1-celled, laterally admits to a petaloid filament; calyx of free sepals.	10.	Phrynium.
Stamens 5 perfect, the sixth imperfect or absent; stigma more or less distinctly 6-lobed.		
•		•

1. GLOBBA, Linn.

Herbs with creeping rhizomes and erect stems. Leaves oblong or oblong-lanceolate. Flowers in terminal panicles or spikes; bracts usually deciduous; buds often replaced by bulbils. Calyx lunnel-shaped, 3-lobed. Petals 3, connate in a corolla with a tube longer than the calyx; corolla-lobes ovate, subequal. Stamen 1 perfect; filament long, incurved, with 2 dorsal appendages; anther oblong, the connective simple, winged, or spurred, produced beyond the cells; lateral staminodes petaloid, contiguous to the corolla-segments. Lip deflexed. Ovary 1-celled; ovules many, on 3 parietal placentas; style filiform, lying in a groove of the filament; stigma turbinate. Fruit a globose capsule, tardily dehiscent.—Distrib. East India, Malaya, China, Philippines, New Guinea; species 60 or 70.

1. Globba bulbifera, Roxb. in As. Res. v. 11 (1810) p. 358. Stems 8-24 in. high, slender, erect or drooping, crowded on a tufted root-stock; root of fleshy fibres. Leaves 3-7 by $1-1\frac{2}{4}$ in., few, elliptic-lanceolate or oblong-lanceolate, distichous, shortly petiolate, green above, paler and more or less puberulous beneath; midrib stout; sheath long, ciliate; ligule very short, ciliate. Flowers in lax spikes or racemes $2-3\frac{1}{2}$ in. long, fragrant, sessile or very shortly pedicellate, the lower replaced by yellow evoid bulbils $\frac{1}{4}-\frac{1}{4}$ in. long; bracts loose, elliptic-oblong, obtus

or subacute, the lower sometimes more than 1 in. long, becoming smaller upwards. Calyx \(\frac{1}{6} - \frac{1}{4} \) in. long, funnel-shaped, 3-toothed. Corolla yellow; tube very slender, nearly \(\frac{1}{2} \) in. long; segments subequal, oblong, shorter than the tube. Lip deeply 2-fid, narrow, deflexed. Filament long, slender, incurved; anther-cells narrow, winged on both sides, the wings spreading, deeply 2-fid. Fruit \(\frac{1}{4} \) in. long, oblong, terete, smooth. Fl. B. I. v. 6, p. 206; Trim. Fl. Ceyl. v. 4, p. 240; Prain, Beng. Pl. p. 1037; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 154. Globba marantina, Wall. Cat. 6532 (not of Linn.); Grah. Cat. p. 211; Dalz. & Gibs. p. 272; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520. G. marantinoides, Wight, Icon. v. 6 (1853) p. 15 (by error in t. 2001 G. marantina).—Flowers: Aug.

Konkan: Stocks!, Law!; Wari country on Wag Donger, Dalzell! S. M. Country: Párva Ghát, Ritchie, 1440! Kanara: Yellapur, Woodrow.—Distrib. India (E. Himalaya, Bengal, W. Peninsula); Ceylon, Malay Islands, Timor.

IMPERFECTLY KNOWN SPECIES.

GLOBBA CANARENSIS, Baker, in Hook. f. Fl. B. I. v. 6 (1890) p. 206. Leaves small, thin, caudate; panicle few-flowered, lax, most of the flowers replaced by long narrow acuminate bulbils; calyx green, narrowly funnel-shaped, & in. long; corollatube more than twice as long as the calyx; corolla-segments oblong, & in. long; anthers not seen.

KANARA: Law!

GLOBBA PLATYSTACHYA, Baker, l. c. Leaves large and thin; panicle short, lax, and very broad, the lower branches 2-4 in. long, ending in a bulbil and bearing numerous close flowers shortly pedicellate towards the end, each subtended by a small persistent ovate acutely-keeled bract; calyx green, broadly funnel-shaped, γ_3 in. long; corolla-tube 3 times the length of the calyx; corolla-segments oblong, yellow, $\frac{1}{8}-\frac{1}{8}$ in. long; anthers not seen.

KONKAN: Law!

The descriptions of these two species are taken from the original descriptions in the 'Flora of British India,' given by Mr. Baker. No fresh material has been sent to Kew, so that no further advance has been made there in the knowledge of the plants.

2. KÆMPFERIA, Linn. Gen. Pl. (1737) p. 331.

Herbs with short stems or stemless; rootstock often tuberous. Leaves few. Flowers spicate, on radical scapes or at the apex of the leafy stem. Calyx short, cylindric, splitting spathaceously. Petals 3, connate in a corolla with a long slender tube; corolla-lobes equal, usually spreading. Stamen 1 perfect; filament short, arcuate; anther 2-celled, the cells discrete, on a wide connective which is produced above into a petaloid crest, not spurred below; lateral staminodes broad, petaloid. Lip broad, usually 2-fid. Ovary 3-celled; ovules many on 3 axile placentas; style long, filiform; stigma turbinate. Fruit an oblong capsule with thin pericarp. Seeds subglobose, with a small lacerate aril.—Distrib. Species about 50, Indian and Malayan.

Stemless; spikes central, radical; anther-crest 2-lobed or 2-fid.

Leaves rotund-ovate, spreading flat upon the ground;
petioles short; lip deeply 2-fid

Leaves narrowed at the base, creet; petioles long; lip entire,
Leafy stem produced; spikes terminal; anther-crest entire,

ciliate

- K. Galanga,
 K. pandurata,
- 3. K. scaposa.

1. Kæmpferia Galanga, Linn. Sp. Pl. (1753) p. 2. Rootstock tuberous, aromatic; root-fibres fleshy, cylindric, not aromatic. Leaves 2, spreading horizontally. lying flat on the surface of the ground, $2\frac{1}{2}$ -5 by $1\frac{3}{4}$ -3½ in., rotund-ovate, deltoid-acuminate, thin, deep green, 10-12-ribbed, the margins not thickened nor colored; petioles short, channelled. Flowers G-12 from the centre of the plant between the leaves, fugacious, fragrant, opening successively; bracts lanceolate, green, short. Calyx as long as the outer bracts. Corolla-tube 1 in. long; lobes lanceolate, pure white, a little shorter than the tube. Lateral staminodes $\frac{3}{6}$ - $\frac{3}{4}$ in. long, cuneate-obovate, white. Lip rather more than 1 in. long and nearly 1 in. broad, deeply 2-lobed, the lobes with a lilac spot at the base. Connective produced into a quadrate 2-lobed appendage. Fl. B. I. v. 6, p. 219; Grab. Cat. p. 208; Wight, Icon. t. 899; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; Prain, Beng. Pl. p. 1038; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 77 (Kæmpfera); Watt, Dict. Econ. Prod. v. 4, p. 561.—Flowers: Junc-July. Yern. Chanda-mula.

KONKAN: S. Konkan, Nimmo ex Graham. Deccan: Miwal, Woodrow.-Distrib.

More or less throughout Inda, often cultivated in gardens; Malay Islands.

The takers according to Royburgh, are employed in perfumery and they

The tubers, according to Roxburgh, are employed in perfumery, and they are used in Hindu medicine. The true Galanga root of the drug-shops is not however furnished by this plant, but by Alpinia officinarum, and a less valuable product by Alpinia Galanga. See Watt, Diet. Econ. Prod. I. c.

2. Kæmpferia pandurata, Roxb. in Asiat. Res. v. 11 (1810) p. 328, t. 2. Stemless; rootstock horizontal, bright yellow within, with many nodose branches and thick succulent vermiform root-fibres. Leaves few (usually 3 or 4), 9-15 by 13-4 in., distichous, erect, elliptic-oblong, acute or shortly acuminate, decurrent into a long deeply channelled petiole which reaches 6 in. long, glabrous and green on both surfaces; midrib stout; ligule short, acute, membranous. Flowers in terminal spikes, subsessile among the leaves; bracts about 2 in. long, linearlanceolate. Calyx-tube about 1 in. long, cylindric, narrow, hyaline, Corolla-tube reaching 2 in, long or more, white or pale pink, very slender, cylindric, erect or curved at the top; segments pink, 3 in. long, oblong, acute, spreading. Staminodes 3, oblong or lanceolate, spreading, the 2 lateral $\frac{1}{2}$ in. long, equal. Lip $\frac{3}{4}$ in. broad, ellipticpanduriform, undulate, white tinged with red. Anther erect, recurved; connective produced into a quadrate short 2-fid appendage. II. B. I. v. 6, p. 220; Grah. Cat. p. 208; Dalz. & Gibs. Suppl. p. 87; Bot. Reg. t. 173; Trim. Fl. Ceyl. v. 4, p. 243; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 89 (Kampfera).

KONHAN: Nimmo ex Graham. Gujarat: Nimmo ex Graham.

Graham [Cat. Pl. Bo. (1839) p. 208] notes this as occurring in the Konkaus and Gujarat on the authority of Nimmo. It has not, however, been found in either locality by recent collectors, while Dalzell & Gibson (Bo. Fl. Suppl. p. 87) say that they have not been able to trace the plant in the S. Konkan and deny that it is indigenous in the Bombay Presidency. I have seen no specimens from thence. Trimen [Fl. Ceyl. (l. c.)] says that it is nowhere wild in Ceylon.—Distrin. Birma, Malaya, Andamans, Ceylon, Java.

3. Kæmpferia scaposa, Benth. in Benth. & Hook. Gen. Pl. v. 3 (1883) p. 642. Leaf-bearing axis of the flowering plant elongate; root-

stock tuberous, oblique; root-fibres long, slender. Leaves numerous, 8-12 by 2-3 in., oblong-lanceolate, long-acuminate, glabrous, green above, paler beneath, narrowed into a deeply channelled petiole as long as the blade. Flowers in terminal dense spikes 3-9 in. long, on usually naked peduncles reaching 18 in. long; bracts the lower remote, the upper dense, 1-21 in. long, lanceolate, acute, green, persistent, each including a pair of flowers. Calyx tubular, loosely sheathing the corollatube, 1-11 in. long, 3-toothed, the teeth subequal. Corolla-tube reaching $3\frac{1}{2}$ in. long; lobes lanceolate, $\frac{3}{4}$ in. long, the posticous cucullate and mucronate. Lateral staminodes oblong, acute, white. Lip broad, 2-fid, more than 1 in. long. Filament short, 1/2 in. long and as broad; connective produced above the anther into a subtrapezoidal ciliate appendage. Stigma turbinate, tuberculate on the back. Capsules obovoid, red, subtomentose, ½ in. long. Seeds dark brown with a white lacerate aril. Fl. B. I. v. 6, p. 224; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 72. Hedychium scaposum, Nimmo, ex Grab. Cat. Pl. Bo. (1839) p. 205; Dalz. & Gibs. p. 273. Monolophus scaposus, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 143; Wight, Icon. t. 2030.—Flowers: July-Nov. Vern. Chohola; Sunha.

Konkan: Stocks!, Law!, Dalzell!; Malwan, Dalzell!; banks of rivulets in the S. Konkan, Dalzell & Gibson. Decean: Stocks!, Woodrow!; Lanoli, Woodrow, Graham, King!; Karli, Graham, Jacquemont, 639! Kanara: Law!—Distrib, India (W. Peninsula).

Kampferia rotunda, Linn. Sp. Pl. (1753) p. 3. A stemless plant with a tuberous rootstock and many thick succulent root-fibres bearing oblong tubers. Leaves few, erect, 12 by 3-4 in., oblong, acuminate, mottled green above and pale red-purple beneath. Flowers sweetly fragrant, of various shades of purple and '' April before the leaves. Cultivated but not indigeno Presidency. Fl. B. I. v. 6, p. 222; Grah. Cat. p. 208; Dalz. & Gibs. Suppl. p. 86; Wight, Icon. t. 2029; Trim. Fl. Ceyl. v. 4, p. 244; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; K. Schum. in Engler, Pfianzenreich, v. 4, part 46 (1904) p. 87; Prain, Beng. Pl. p. 1038; Watt, Dict. Econ. Prod. v. 4, p. 561.—Flowers: Apr. Vern. Bhui-champa.

3. HITCHENIA, Wall.

Annual herbs; rhizome with tuberiferous fibres. Leaves petiolate or sessile, oblong-lanceolate or elliptic. Flowers in terminal spikes; bracts subcoriaceous, all fertile or the upper sterile, forming a coma. Calyx tubular, membranous, 3-toothed. Corolla-tube elongate, slender, slightly enlarged above; lobes 3, subequal, oblong or ovate. Lateral staminodes petaloid, free from the filiform filament. Lip scarcely longer than the corolla-lobes, orbicular or cuneate, 2-lobed. Anther-cells marginal on the broad connective, not crested; filament as long as the lip, narrow, complicate. Ovary 3-celled; ovules many, superposed; style filiform; stigma exserted beyond the anther-cells, turbinate. Capsule oblong, 3-gonous, coriaceous, crowned by the calyx, variously rupturing or sub3-valved. Seeds shining, usually arillate.—Distrib. Species 3, Indian.

1. Hitchenia caulina, Baker, in Hook. f. Fl. B. I. v. 6 (1890) p. 224. Rhizome with many ellipsoid tubers hanging to the fibres, the tubers white inside; stem leafy, 3-4 ft. high. Leaves 12-20 by 3-6 in.. oblong-lanceolate, acuminate, narrowed at the base, waved, strongly nerved, with sheathing petioles. Flowers yellow or white, in terminal spikes 5-9 in. long and reaching 2½ in. in diam.; bracts 1-1¼ in. long, green or greenish-white, sometimes tinged with red, obovate-cuneate. those of the coma white or occasionally pink, all united together by their backs and edges. Calyx thinly membranous, tubular, 3-fid. Coroliatube 14 in. long, slender; lobes thinly membranous, one larger than the other two, the large one ovate-oblong, shortly acuminate, the 2 smaller linear-oblong. Lateral staminodes petaloid, ½ in. long. Lip ½ in. in diam., 2-fid, with a yellow band at the division. Anther-cells oblong, spurred at the base. Ovary 3-celled; style hidden between the cells of the anther; stigma 2-lipped, funnel-shaped, ciliate at the top, projecting beyond the anther. Seeds ovoid, with a lacerate aril. Woodr, in Journ. Bomb. Nat. v. 12 (1899) p. 520; K. Schum. in Engler, Pflanzonreich, v. 4, part 46 (1904) p. 97. Curcuma caulina, Grah. Cat. Pl. Bo. (1839) p. 210; Dalz. & Gibs. p. 275; Watt, Dict. Econ. Prod. v. 2, p. 658.— Flowers: Aug.-Oct. Venn. Chávar.

Drccan Mahableshwar, abundant, Graham, Dalzell & Gibson, Cooke!, Woodrow!, H. M. Birdwood, Khandala, Cooke!, Panchgani, Woodrow.—Distrib. India (W. Peninsula).

Known to Anglo-Indians at Mahableshwar as the Arrowroot Plant. Arrowroot was at one time extracted from the tubers by the Chinese gardeners on the hill. See Watt, Dict. Econ. Prod. l. e.

4. **HEDYCHIUM**, Koenig.

Herbs with perennial tuberous rootstocks; root-fibres hardly thickened; stem elongate, leafy. Leaves distichous, oblong or lanceolate. Flowers usually in terminal spikes; bracts oblong, subcoriaceous, 1- or more-flowered. Calyx tubular, 3-toothed. Corolla-tube long, slender; lobes equal, linear, spreading. Perfect stamen 1; lateral staminodes linear or cuneate-oblong. Lip large, 2-fid. Ovary 3-celled; ovules many, superposed on axile placentas; style long, filiform; stigma subglobose. Fruit a globose 3-valved capsule. Seeds many, small, with a lacerate aril.—Distrib. Species 38, chiefly Indian and Malayan.

1. **Hedychium coronarium**, *Koenig*, in Retz. Obs. Bot. fasc. 3 (1783) p. 73. Stem 3-5 it. high, erect; rootstock stout, horizontal, \(\frac{1}{2}-2\) in. in diam., fleshy, jointed. Leaves sessile, 9-14 by \(\frac{1}{4}-2\) in., lanceolate, finely acuminate, glabrous above, glabrous or sparsely pubescent beneath and on the midrib, base narrowed; sheath smooth; ligule \(\frac{1}{4}-1\) in. long, membranous. Flowers fragrant, pure white, in dense oblong spikes 4-8 in. long; bracts closely imbricate, 3-4-flowered, the outer \(\frac{1}{2}-2\) by 1 in., at first green, becoming brown by age, ovate, obtuse; bracteoles 3, membranous. Caly x 1-1\(\frac{1}{2}\) in. long, cylindric, green, shorter than the bracts. Corolla-tube 3 in. long; segments linear, half as long as the tube, reflexed. Lateral staminodes \(\frac{1}{2}-2\) by \(\frac{1}{2}\) in., oblong-lanceolate, subobtuse, white. Lip \(\frac{1}{2}-2\) in. broad, suddenly contracted into a short claw, entire or 2-fid; lobes short, rounded. Stamen \(\frac{1}{4}\) in. long; anther about \(\frac{1}{2}\) in. long. Capsules oblong, glabrous, the valves orange-

yellow inside. Seeds many, with a crimson aril. Fl. B. I. v. 6, p. 225; Grah. Cat. p. 205; Dalz. & Gibs. Suppl. p. 86; Wight, Icon. t. 2010; Bot. Mag. t. 708; Trim. Fl. Ceyl. v. 4, p. 245; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 44; Prain, Beng. Pl. p. 1039.—Flowers: Aug.—Sept. Venn. Sontaka.

Konkan: Law! Deccan: Lanoli, Woodrow; Mahableshwar, H. M. Birdwood. Kanana: Kála naddi near Supa, Ritchie, 1435!—Distrib. Throughout India; Ceylon, Malay Islands.

5. CURCUMA, Linn.

Stemless herbs with tuberous rootstocks bearing sessile and long-stipitate tubers. Leaves usually oblong, often very large. Flowers in dense compound spikes, vernal or æstival, and preceding, or autumnal and contemporaneous with the leaves, crowned by a coma of enlarged colored bracts; lower bracts ovate, membranous, enclosing several bracteolate fugacious flowers which open in succession. Calyx short, cylindric, minutely toothed. Corolla-tube funnel-shaped; corolla-lobes usually ovate or oblong, the upper longer and somewhat concave. Stamen 1 perfect; filament short; anthers not crested, with contiguous cells spurred at the base; lateral staminodes oblong, petaloid, connate with the filament. Lip orbicular, with a deflexed tip. Ovary 3-celled; ovules numerous on axile placentas; style filiform; stigma 2-lipped, the lips ciliate. Fruit a tardily dehiscent globose membranous 3-valved capsule. Seeds ovoid or oblong, usually arillate.—Distrib. Species about 40, chiefly in S.E. Asia.

Flowering spike vernal or astival, lateral, apart from and usually appearing before the leafy spike. Leaves 6-10 in. long; rootstock small, emitting fleshy fibres terminating in small tubers white inside; 1. C. neilgherrensis. branched sessile tubers yellow inside; corolla-lobes 2. C. aromatica. Flowering spike autumnal, rising in the centre of a previously formed tuft of leaves. Rootstock small, bearing tubers at the ends of the fibres (no sessile tubers); tubers white inside. Flowers yellow 3. C. pseudomontana. 4. C. decipiens. Flowers purple Rootstock large; tubers sessile, pale yellow inside

1. Curcuma neilgherrensis, Wight, Icon. v. 6 (1853) p. 16, t. 2006. Whole plant with the leaves rarely reaching 16 in. high, sometimes not more than 3 in. or even less before the leaves appear; rootstock small, white inside; root-fibres numerous, slender. Leaves 6-10 by $1\frac{1}{2}-2\frac{1}{2}$ in., shortly petiolate, lanceolate or oblong-lanceolate, acuminate, glabrous, narrowed at the base. Flowers bright yellow, in dense vernal spikes of variable length depending on the size of the plant (in well-grown specimens reaching 4 in. long by 2 in. in diam.); peduncles of variable length with sheaths at the base; flowering bracts $1-1\frac{1}{2}$ in. long, oblong-lanceolate, acute, pale yellowish-green, the bracts of the coma dense, pink. Calyx $\frac{1}{3}$ in. long, 3-toothed, split down one side. Corolla-tube $\frac{5}{6}$ in. long; lobes oblong. Lip broadly ovate or suborbicular,

more highly colored than the lobes, obtuse, 2-fid at the apex. Capsules glabrous, globose, $\frac{1}{2}$ in. in diam. Fl. B. I. v. 6, p. 210; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 109. Curcuma angustifolia, Dalz. & Gibs. Bo. Fl. (1861) p. 274 (not of Roxb.).

Konkan: Stocks!, Law! Deccan: Sinlagad near Poona, Woodrow. S. M. Country: Dharwar, Law! Kanara: Law!—Distrib. India (W. Peninsula).

2. Curcuma aromatica, Salisb. Parad. Lond. t. 96 (1805). Rootstock large, of palmately branched, sessile annulate biennial tubers yellow and aromatic inside. Leaves 15-24 by 4-8 in., oblong-elliptic or oblong-lanceolate, caudate-acuminate, green, often variegated above, pubescent beneath, base deltoid; petioles as long as or longer than the blade. Flowering stem appearing with or before the leafing stem, as thick as the forefinger, sheathed. Flowers fragrant, shorter than the bracts, in spikes 6-12 in. long; flowering bracts 12-2 in. long, ovate, recurved, cymbiform, rounded at the tip, pale green, connate below forming pouches for the flowers; bracts of the come 2-3 in. long, more or less tinged with red or pink. Calyx 4 in. long, irregularly 3-lobed. Corolla-tube 1 in. long, the upper half funnel-shaped; lobes pale rosecolored, the lateral lobes oblong, the dorsal longer, ovate, concave, arching over the anthers. Lip yellow, obovate, deflexed, subentire or obscurely 3-lobed. Lateral staminodes oblong, obtuse, as long as the corolla-lobes. Fl. B. I. v. 6, p. 210; Wight, Icon. t. 2005; Rosc. Monandr. Pl. (1828) t. 103; Trim. Fl. Ceyl. v. 4, p. 241; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; K. Schum. in Engler, Pflanzenreich. v. 4, part 46 (1904) p. 111; Prain, Beng. Pl. p. 1041; Watt, Diet. Econ. Prod. v. 2, p. 655. Curcuma zedoaria, Roxb. As. Res. v. 11 (1810) p. 333 (not of Rosc.); Grah. Cat. p. 209; Dalz. & Gibs. p. 274; Bot. Mag. t. 1546.—Flowers: May. VERN. Rán-haldi; Amba-halad.

KONKAN: Dalzell & Gibson; moist shady places in the Konkan, Graham; Kanheri forests, Graham; Parel Hill (Bombay), Graham,—Distrib. India (Bengal, W. Peninsula); sometimes cultivated and known as Yellow Zedoary. The tubers are used medicinally. See Watt, Dict. Econ. Prod. 1, c.

3. Curcuma pseudomontana, Grah. Cat. Pl. Bomb. (1839) p. 210. Rootstock small, bearing small almond-like or subglobose tubers at the ends of the fibres (but no sessile tubers); tubers pure white inside, edible. Leaves uniformly green, reaching 2 ft. or more long (including the petiole), 4-6 in. broad, lanceolate-oblong, acuminate, tapering to the base; petioles 8-15 in. long. Flowers appearing with the leaves, bright yellow, 2 or 3 in each bract, in autumnal central narrowly oblong spikes 2-5 by 1-13 in.; peduncles 3-4 in. long, embraced by leaf-sheaths; flowering bracts $1\frac{1}{4}-1\frac{3}{4}$ by $\frac{5}{8}-\frac{7}{8}$ in., obovate-lanceolate, green with an acute pink tip; bracts of coma oblong-lanceolate, the lowest with purple. edges only, the upper more or less uniformly mauve-purple. Dalz. & Gibs. p. 275; Lisbon, in Journ. Bomb. Nat. v. 2 (1887) p. 144; Watt, Dict. Econ. Prod. v. 2, p. 669. Curcuma Ranadei, Prain, in Journ. Bomb. Nat. v. 11 (1898) p. 463; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 440. C. montana, Baker, in Hook. f. Fl. B. I. v. 6, p. 214 in part (not of Rosc.); Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520.—Flowers: Sept. Vern. Sindarbar; Shindalvan.

Konkan: Stocks!, Law!, Dalzell & Gibson; Salsette, Graham.

Baker in Hook. f. Fl. B. I. l. c. has reduced this to C. montana, Roxb., but the tubers in Roxburgh's plant are sessile and yellow inside, while Graham, though admitting that his plant is closely allied to C. montana, describes its tubers as hanging from the fibres of the rootstock and perfectly white inside. There are unfortunately no rhizomes to any of the specimens in Herb. Kew. which have been named C. montana or C. pseudomontana, and an examination of fresh specimens by botanists on the spot is very desirable. Graham makes a mistake in his description in stating that the leaves are 19 inches wide, an error which Dalzell & Gibson reproduce, reducing the width however to 18 inches.

The description given by Graham, though rather indefinite as to size and shape of tubers, seems to fit the plant described as C. Ranadei by Colonel Prain (Journ. Bomb. Nat. l. c.). Thus, the lower bracts of the coma are, in the case of C. Ranadei, described by Colonel Prain as having purple edges, while the bracts of C. pseudomontana are said by Graham to have their edges dark brown or reddish. Again, the upper bracts of the coma of C. Ranadei are described as more or less uniformly mauve-purple, those of C. pseudomontana as dark rose-colored. The flowers in both are bright yellow, the inflorescence being central. The fact that C. Ranadei was grown in a pot in Calcutta from a tuber accidentally sent from Bombay together with rhizomes of Kæmpferia scaposa, under climatic conditions differing greatly from those of the natural home of the plant in the Konkan hills, might account for minor differences.—Distrib. India (W. Peninsula), apparently endemic.

The tubers are boiled and eaten in times of scarcity according to Graham.

4. Curcuma decipiens, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 144. Rootstock bearing numerous almond-like tubers white inside at the ends of the fibres, but with no sessile tubers. Leaves 6-8 by 3-5 in., broadly elliptic, shortly deltoid-acuminate, membranous, green, usually glabrous, base rounded or subcordate; petioles as long as the leaf. Flowers twin, purple, in astival spikes $2\frac{1}{2}$ -5 by $1-1\frac{3}{4}$ in., those which first emerge from the soil lateral, the later spikes central; peduncles $2\frac{1}{2}$ -3 in. long; flowering bracts 1 in. long, ovate, obtuse, saccate, purple; bracts of the coma numerous, oblong, purple. Calyx nearly $\frac{1}{2}$ in. long, obtusely toothed, puberulous below the teeth and near the base. Corolla purple; tube twice as long as the calyx; lobes oblong-lanceolate. Lip obovate, 2-fid, with crisped margins. Fl. B. I. v. 6, p. 215; Dalz. & Gibs. p. 274; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 105.—Flowers: June-Sept.

Konkan: Law!, Stocks!, Dalzell!; Malwan, Dalzell!; Uran (island in Bombay Harbour), Dalzell!—Distrib. India (W. Peninsula), apparently endemic.

5. Curcuma Amada, Roxb. in Asiat. Res. v. 11 (1810) p. 341. Rootstock large; sessile tubers thick, cylindric or ellipsoid, pale yellow inside. Leaves long-petiolate, in tufts, the blade 12-18 by 3-5 in., oblong-lanceolate, acute or acuminate, narrowed to the base, glabrous and green on both sides; petioles as long as the leaf-blade (12-18 in.). Flowers in autumnal spikes 3-6 by 1½-2 in., in the centre of the tuft of leaves; peduncle 6 in. long or more; flowering bracts 1 in. long, greenish-white; bracts of the coma longer and narrower, tinged with pink or red. Calyx nearly ½ in. long, obtusely 3-toothed. Corolla white or very pale yellow; tube about 1 in. long; lobes oblong, acute. Lip semi-elliptic, yellow, 3-lobed, the middle lobe emarginate. Fl. B. I. v. 6, p. 213; Grah. Cat. p. 209; Dalz. & Gibs. p. 275; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 108; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; Prain, Beng. Pl. p. 1041; Watt, Dict. Econ. Prod. v. 2, p. 652.—Flowers: Sept.

KONKANS and GUJARAT, Nintmo ex Graham. I have seen no specimens from the Bombay Presidency; there are none in Herb. Kew. Woodrow in his list merely quotes Nimmo.—Distrib. India (Bengal, W. Peninsula); Malay Peninsula and Archipelago.

The plant is often cultivated and known as the Mango-Ginger; the tubers when fresh have somewhat the odor of a green Mango, hence the name. They are employed in native medicine as carminative and stomachic. See Watt, Diet. Econ. Prod. I. c.

Curcuma zeiloaria, Rosc. Monandr. Pl. (1828) t. 109. Rootstock of palmately-branched sessile cylindric oblong annulate tubers, pale yellow inside, with a camphoraceous odor and bitterish spicy taste, also bearing long fleshy fibres that terminate in smaller oblong less fragrant tubers. Leaves 4-6 with long petioles, 1-2 ft. long, oblong-lanceolate, finely acuminate, glabrous on both surfaces, clouded with purple down the middle. Flowering stem 8-10 in. long, appearing before the leaves. stout, clothed with obtuse sheaths. Flowers yellow in spikes 3-5 by 2-3 in.; flowering bracts 11 in. long, ovate, recurved, cymbiform, green tinged with red; bracts of the coma reaching 2 in, long, crimson or purple. Calyx 1 in. long, obtusely 3-toothed. Corolla-tube twice as long as the calyx, funnel-shaped; lateral lobes oblong, the dorsal lobe larger, vaulted, arching over the auther. Lip 1/2 in. broad, suborbicular. deflexed, obscurely 3-lobed, deep yellow. Capsule ovoid, 3-gonous, thin, smooth, bursting irregularly. Seeds ellipsoid with a white lacerate aril. Fl. B. I. v. 6, p. 210; Trim. Fl. Ceyl. v. 4, p. 241; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 110; Prain, Beng. Pl. p. 1041; Watt, Dict. Econ. Prodr. v. 2, p. 669. Curcuma Zerumbet, Roxb. in Asiat. Res. v. 11 (1810) p. 333; Grah. Cat. p. 209 .- Venn. Kachora.

Not wild in the Bombay Presidency; cultivated more or less throughout India;

said to be wild in the Eastern Himalaya and in Chittagong.

The tubers are employed in native medicine as a stomachic and also as an application to bruises and sprains. Powdered and dried they used to form one of the constituents of the red powder used by the Hindus at the Holi festival. See Watt, Dict. Econ. Prod. l. c.

Curcuma longa, Linn. Sp. Pl. (1753) p. 2. A tall herb; rootstock large, ovoid, with sessile cylindric tubers orange inside. Leaves very large, in tufts, reaching 4 ft. or more long (including a petiole about as long as the blade), oblong-lanceolate, tapering to the base. Flowers in autumnal spikes 4-6 by 2 in.; peduncles 6 in. long or more, hidden by the sheathing petiole; flowering bracts pale green; bracts of the coma tinged with pink. The plant is cultivated all over India for the turmcric obtained from its rhizomes, but is doubtfully wild anywhere in India, though Mr. Clarke considers it to be wild in Behar, and Prain says it may perhaps be indigenous in Chota Nagpur. Watt (Dict. Econ. Prod. v. 2, p. 660) suggests that it may have been introduced from China or Cochinchina. It is largely cultivated in the Bombay Presidency in places where the soil is good and the water-supply abundant. Fl. B. I. v. 6, p. 214; Grah. Cat. p. 209; Dalz. & Gibs. p. 87; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 520; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 108; Prain, Beng. Pl. p. 1041; Watt, Dict. Econ. Prod. v. 2, p. 659. VERN. Huldi.

6. AMOMUM, Linn.

Herbs with elongate leafy stems and perennial extensive rootstocks. Leaves usually oblong-lanceolate. Flowers in dense spikes direct from the rootstock; bracts imbricate. Calyx cylindric, 3-toothed. Corollatube cylindric; lobes 3, oblong or linear-oblong, the upper often broader and more convex. Stamen 1 perfect; filament short, arcuate; anther 2-celled, the cells divaricate, sometimes hairy, often with a petaloid crest; lateral staminodes minute or obsolete. Lip broad or ligulate. Ovary 3-celled; ovules many, superposed; placentas axile; style filiform; stigma small, subglobose, or larger and dorsally gibbous. Fruit indehiscent or bursting irregularly, sometimes beaked or winged or echinate. Seeds globose or truncate. - DISTRIB. India, Malayan Archipelago, New Guinea, Australia, Philippine Islands, China, Japan; species about 87.

1. Amomum microstephanum, Baker, in Hook. f. Fl. B. I. v. 6 (1892) p. 239. A perennial herb reaching 4 ft. or more in height; stems leafy. Leaves large, 20-24 by 2½-4 in., linear-lanceolate, acuminate, glabrous above, silky-pubescent beneath, base tapering; petioles 3-7 in. long. Flowers white, in globose shortly pedunculate spikes 2 in. in diam.; exterior bracts few, oblong, glabrous, $1-1\frac{5}{8}$ in. long, the inner bracts membranous. Calyx 3-7 in. long, tubular, membranous, 3-toothed, split down one side. Corolla-tube shorter than the calyx; lobes linear-oblong, half as long as the tube. Lip $1\frac{1}{4}$ in, long, obovate. Anther glabrous, $\frac{1}{2}$ in. long; crest small, orbicular. Capsules 9-ribbed, K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 257.

Rare. Konkan: Stocks!; near Chandavár (planted), Ritchie!-Distrib. India (W. Peninsula),

7. ZINGIBER, Adans.

Herbs with elongated leafy stems and horizontal tuberous rootstocks. Leaves oblong-lanceolate. Flowers in spikes usually radical, less commonly terminal, very rarely lateral on the leafy stems; peduncle short or long; bracts persistent, usually 1-flowered. Calyx cylindric, shortly Corolla 3-lobed, with a cylindric tube; lobes lanceolate, the upper concave. Stamen 1 perfect; filament short; anther 2-celled, the cells contiguous, with a narrow crest as long as themselves; lateral staminodes 0, or adnate to the obovate-cuneate lip. Ovary 3-celled; ovules many, superposed; placentas axile; style filiform; stigma small, subglobose. Fruit an oblong capsule, tardily dehiscent. Seeds large, globose, arillate.—Distrib. Species 55, East Indies, Malaya, and New Guinea; 1 species widely cultivated throughout the Tropics.

Spikes produced direct from the rootstock very short and dense; peduncles very short or 0.

Leaves pubescent beneath; lip yellowLeaves glabrous beneath; midlobe of lip variegated pink Z. Nimmonii. and white; the side lobes red and yellow

2. Z. cernuum.

Spikes terminating elongate peduncles beset with sheathing scarious bracts.

Lip yellowish-white, marked with purple lines; side lobes of lip small; capsule ellipsoid, 1 in. long..... Lip yellowish-white, not marked with purple lines; side lobes of lip large; capsule subglobose, & inch

4. Z. macrostachyum.

5. Z. Cassumar.

1. Zingiber Nimmonii, (by error Nimmoi, corrected in Dalz. & Gibs. Bo. Fl. p. 273), Dalz. in Kew Journ. Bot. v. 4 (1852) p. 341. Stem leafy, 4-5 ft. high, as thick as the middle finger, reddish-green, glabrous. Leaves 6-12 by 2-3 in., nearly sessile, oblong-lanceolate, acuminate, green and glabrous above, pubescent beneath, base acute; petioles scarcely & in. long, with long sheaths and a short truncate ligule about 10 in. long. Flowers in shortly pedunculate ovate or subglobose spikes scarcely rising above the ground; bracts linear-oblong or lanceolate, acute, glabrous, green streaked with red, the inner 2-fid. Corollatube as long as the bracts; lobes reddish-yellow. Lip 3-lobed, yellow; midlobe rotund-ovate or subobovate, scarcely emarginate; side lobes small, rounded. Capsules ellipsoid, the size of a pigeon's egg. Fl. B. I. v. 6, p. 244; Dalz. & Gibs. p. 273; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 184. Alpinia Nimmonii, Grah. Cat. Pl. Bo. (1839) p. 206.—Flowers: July.

KONKAN: Stocks!, Law!; N. & S. Konkan, Dalzell of Gibson; Sahyadri range, Dalzell! Deccan: Lanoh Grove, abundant, Graham; Khandala, Graham. KANARA: Law!-Distrib. India (W. Peninsula).

2. Zingiber cernuum, Dalz. in Kew Journ. Bot. v. 4 (1852) p. 342. Stem bright green, somewhat curved, glabrous. Leaves narrowly elliptic, acuminate, glabrous on both sides. Spikes ovate, obtuse, very shortly pedunculate, scarcely appearing above the ground; bracts ovate or oblong, somewhat obtuse, greenish-yellow, glabrous, the inner shortly 3-fid. Corolla buff-colored. Lip 3-lobed; midlobe ovate, deeply 2-fid, variegated with white and red; side lobes variegated with red and yellow. Fruit yellowish-white, smooth. Seeds (unripe) red, striated; aril membranous. Fl. B. I. v. 6, p. 245; Dalz. & Gibs. p. 273; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 182.—Flowers: July.

S. M. Country: Ramghat, Dalzell.

The description above is that of Dakell. I have seen no specimens; there are none

in Herb. Kew.

The plant unfortunately flowers in July, at which time the whole of the hill-sides are streaming with water, rendering plant-collecting a task of no ordinary difficulty. It is hoped that local botanists will endeavour to procure specimens, describe them when fresh, and send some to the Kew Herbarum.—Distrin. India (W. Peninsula).

3. Zingiber Zerumbet, Roscoe, ex Smith, Exot. Bot. v. 2 (1805) p. 105, t. 112. Rootstock large, not much branched, hard, biennial, yellow inside, with a strong aromatic ginger-like taste, but with some bitterness; root-fibres vermiform; leafing stem 3-5 ft. high, about & in. in diam., cylindric, glabrous, annual. Leaves 8-12 by 2-3 in., sessile, oblong-lanceolate or oblanceolate, acuminate, glabrous, base narrowed:

ligule $\frac{1}{3}$ - $\frac{3}{4}$ in. long, truncate, membranous. Flowering stem 12-18 in. long, stout, usually flexuous, clothed with long appressed obtuse sheaths. Flowers pale sulphur-yellow, in conico-oblong or ovoid obtuse spikes 3-4 by 2 in.; bracts 1-12 in. long, closely imbricate, ovate-oblong or obovate, with rounded apex and pale membranous margins, bright green at first but becoming red in fruit. Calyx-tube 1 in. long, appressed to the corolla-tube, 3-toothed, glabrous. Corolla-tube 1½ in. long; lobes ovate-lanceolate, acuminate, the lateral smaller, adnate to the base of the lip. Lip shorter than the corolla-lobes and of a darker yellow, 3-fid; lobes obtuse, the midlobe the longest. Anther glabrous. brous; stigma minute, funnel-shaped with ciliate mouth. Capsules ellipsoid, I in. long. Seeds \(\frac{1}{6}\) in. long, oblong, black. Fl. B. I. v. 6, p. 247; Grah. Cat. p. 207; Dalz. & Gibs. p. 272; Wight, Icon. t. 2003; Bot. Mag. t. 2000; Trim. Fl. Ceyl. v. 4, p. 259; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 172; Prain, Beng. Pl. p. 1044; Watt, Dict. Econ. Prod. v. 6, part 4, p. 366.—Flowers: July.

KONKAN: Nimmo ex Graham; common about old wells in the S. Konkan, Dalzell & Gibson; sometimes cultivated.—Distrib. Throughout India; Ceylon, Malay Peninsula; widely cultivated in the Tropics of the Old World.

4. Zingiber macrostachyum, Dalz. in Kew Journ. Bot. v. 4 (1852) p. 342. Leafing stem reaching 20 in. high, red, pubescent. Leaves sessile, 5-12 by 1-2 in., lanceolate, acuminate, dark green and glabrous above, paler and pubescent beneath; sheaths ribbed, puberulous near the top; ligule $\frac{1}{8}$ in. long, 2-lobed, the lobes rounded, pubescent. Flowers in long cylindric spikes 6-12 in. long; peduncle about as long as the spike, with large oblong bract-like scarious sheaths; bracts obovate, acute, reddish, reaching 14 in. long. Corolla white or greenish-white; tube as long as the bracts; lobes lanceolate, nearly 1 in. long. Lip obovate, 3-lobed; midlobe rounded, emarginate, pale yellow marked with diverging purple lines; lateral lobes small, obtuse. Capsules obovoid, pubescent, red, of the size of a sparrow's egg. Seeds dark purple with a large white aril. Fl. B. I. v. 6, p. 247; Dalz. & Gibs. p. 273; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 179. Alpinia Neesana, Grah. Cat. Pl. Bo. (1839) p. 207 .- Flowers: July. VERN. Nisam.

Konhan: Wargaon, Graham. Deccan: Mahableshwar, H. M. Birdwood; Khandala, Graham; Lanoli on the borders of the grove, Graham. S. M. Country: Rúmghát, Dalzell. Kanara: Kála naddi, Ritchie, 719!—Distrib. India (W. Peninsula), apparently endemic.

5. Zingiber Cassumar, Roxb. in Asiat. Res. v. 11 (1810) p. 347, t. 5. Rootstock perennial, yellow inside, with an aromatic, warm, somewhat camphoraceous taste, without bitterness. Leafing stem 4-6 ft. high. Leaves subsessile, 9-14 by $\frac{3}{4}-1\frac{1}{2}$ in., oblong-lanceolate, acute, glabrous above, pubescent beneath, base slightly rounded; sheaths pubescent. Flowers in dense fusiform or oblong-ellipsoid spikes $3\frac{1}{2}-6$ by $1\frac{1}{2}-2$ in.; peduncles 4-10 in. long, with numerous oblong sheaths; bracts $1-1\frac{1}{2}$ in. long and nearly as broad as long, broadly ovate, subacute, bright-red or greenish-red, or green, pubescent and

with narrow membranous margins. Calyx \(\frac{3}{4}\) in. long, membranous, truncate, glabrous, split half-way down. Corolla-tube 1 in. long, slender, glabrous; lobes lanceolate, the lateral 1 by \(\frac{1}{4}\) in., the dorsal 1\(\frac{1}{4}\) by \(\frac{3}{6}\) in., concave. Lip suborbicular, deeply 2-lobed, nearly 1 in. in diam., yellow (not spotted), with crisped margins. Stamen yellowishwhite, shorter than the lip, the appendix of the connective long, flexuous. Style glabrous; stigma obconic, ciliate. Capsules subglobose, \(\frac{2}{3}\) in. long, membranous. Seeds many, very small, purple. Fl. B. I. v. 6, p. 248; Grah. Cat. p. 207; Dalz. & Gibs. p. 272; Trim. Fl. Ceyl. v. 4, p. 258; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521; K. Schum. in Engler, Pfianzenreich, v. 4, part 46 (1904) p. 179; Prain, Beng. Pl. p. 1044; Watt, Diet. Econ. Prod. v. 6, part 4, p. 357.—Flowers: July-Aug. Vern. Malbári-halad.

KANARA: Stocks!; W. Gháts, Woodrow. S. M. Country: Londa, Woodrow. KANARA: Law!—Distrin. Throughout India; Ceylon, Malay Peninsula; widely cultivated in Tropical Asia.

Zingiber officinale, Roscoe, in Trans. Linn. Soc. v. 8 (1807) p. 348. A herb with slender leafy stems 3-4 ft. high, which furnishes the Ginger of commerce, not apparently known in the wild state, but doubtless a native of Tropical Asia. It is cultivated largely throughout the tropics. It rarely flowers and still more rarely produces seed (Roxburgh). It is extensively grown in the Deccan and Gujarat.—Venn. Ale, Adrak (the fresh root); Sunt (the dried root). Fl. B. I. v. 6, p. 246; Grah. Cat. p. 207; Dalz. & Gibs. Suppl. p. 87; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 170; Prain, Beng. Pl. p. 1044; Watt, Dict. Econ. Prod. v. 6, part 4, p. 358.

8. COSTUS, Linn.

Herbs with long leafy stems; rootstock tuberous, horizontal. Leaves oblong, with broad sheaths. Flowers in dense globose or ovoid usually terminal heads. Calyx short, funnel-shaped; teeth 3, ovate. Corollatube short; corolla-lobes large, oblong, subequal. Stamen 1 perfect; filament forming with the connective an oblong petaloid process with the contiguous linear anther-cells situated in its middle; lateral staminodes minute or obsolete. Lip large, obovate, with incurved margins. Ovary 3-celled; ovules many, superposed; placentas axile; style filiform; stigma with a semi-linear marginally ciliate foveola. Fruit a globose or ovoid capsule tardily opening on one side between the ribs. Seeds obovoid or subglobose; aril short.—Distant. Species nearly 100, in the tropics of both hemispheres.

1. Costus speciosus, Smith, in Trans. Linn. Soc. v. 1 (1791) p. 249. An erect plant 4-9 ft. high; rootstock tuberous, insipid; stem subwoody at the base. Leaves 6-12 by $2\frac{1}{4}$ -3 in., subsessile, spirally arranged, oblong or oblanceolate-oblong, acute or acuminate, often cuspidate, glabrous above, silky-pubescent beneath, base rounded; sheaths coriaceous; ligule 0. Flowers white, numerous, in very dense spikes 2-5 by $1\frac{1}{2}$ -3 in.; bracts $\frac{3}{4}$ - $1\frac{1}{4}$ in. long, ovate, acuminate, often pungently mucronate, bright-red; bractcole solitary below the calyx,

 $\frac{e}{2}$ in. long. Calyx $1\frac{1}{4}$ in. long; lobes $\frac{1}{4}$ in. long, deltoid-ovate, cuspidate. Corolla-tube as long as the calyx; lobes ovate-oblong, apiculate, the lateral lobes $1\frac{2}{8}$ by $\frac{1}{2}$ in., the dorsal $1\frac{e}{8}$ by $\frac{3}{4}$ in. Lip suborbicular, white with a yellow centre, 2 in. and more in diam., concave, plicate, crisped, the margins sometimes meeting in the middle; disk pubescent and with a tuft of hairs at its base. Stamen $1\frac{1}{2}-1\frac{3}{4}$ in. long, with a tuft of hairs at the base of the filament; connective petaloid, $\frac{1}{2}$ in. broad, pubescent, produced into a glabrous appendage as long as the linear anther-cells. Style $1\frac{1}{2}$ in. long, slender; stigma with a semilunar ciliate mouth. Capsules globosely 3-gonous, $\frac{3}{4}$ in. in diam., red. Seeds black, with a white aril. Fl. B. I. v. 6, p. 249; Grab. Cat. p. 208; Dalz. & Gibs. p. 274; Trim. Fl. Ceyl. v. 4, p. 246; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 398; Prain, Beng. Pl. p. 1045; Watt, Dict. Econ. Prod. v. 2, p. 579.—Flowers: Aug.—Oct. Vern. Kosht.

Konhan: W. Gháts, Woodrow, Ritchic, 1438!; Kanheri forests, Graham; Salsette, Graham. Deccan: Khandala, Graham, Cooke! S. M. Country: Castlerock, Woodrow.—Distrib. More or less throughout India; Ceylon, Malay Islands.

9. ALPINIA, Linn.

Herbs with elongate leafy stems and horizontal rootstocks. Leaves oblong or lanceolate. Flowers in terminal racemes or panicles; bracteoles large, sometimes enveloping the buds. Calyx loosely tubular, 3-toothed. Corolla-tube cylindric, rarely longer than the calyx; corolla-lobes oblong or linear-oblong, the upper usually broader and more convex than the lateral. Stamen 1 perfect; filament flattened; anther-cells diverging at the top, occasionally with an orbicular crest; lateral staminodes minute or obsolete. Lip spreading, often orbicular, with incurved margins, sometimes with 2 subulate processes at the base of the claw. Ovary 3-celled; ovules few or many on each placenta; style filiform; stigma subglobose. Fruit globose, dry or fleshy, usually indehiscent. Seeds globose or angled.—Distrib. India, Malaya, Philippines, New Guinea, Pacific Islands, China, Japan; species about 150.

Lip broadly elliptic, white striated with red; fruit orange-red ... 1. A. Galanga.
Lip obovate-cuneate, emarginate, pink; fruit black 2. A. Allhugas.

1. Alpinia Galanga, Swartz, Obs. Bot. (1791) p. 8. Rootstock perennial, tuberous, slightly aromatic. Leaves 9-18 by $1\frac{1}{2}-4\frac{1}{2}$ in., oblong-lanceolate, acute, glabrous, green above, paler beneath, with slightly callous white margins; sheaths long, glabrous; ligule reaching $\frac{3}{8}$ in. long, but usually shorter, rounded. Flowers greenish-white, in dense-flowered panicles 6-12 in. long; branches short; rhachis pubescent; pedicels $\frac{1}{8}$ in. long; bracts $\frac{3}{8}$ in. long, ovate-lanceolate. Calyx $\frac{3}{8}$ in. long, tubular, irregularly 3-toothed. Corolla $1\frac{1}{4}$ in. long; tube $\frac{1}{2}$ in. long; lobes oblong, obtuse, subequal, $\frac{1}{4}$ in. broad. Lip $\frac{7}{8}$ in, long; claw green, $\frac{1}{4}$ by $\frac{7}{10}$ in.; blade white striated with red, rather more than $\frac{1}{2}$ in. long, broadly elliptic, shortly 2-lobed at the apex, with a pair of subulate glands at the base of the claw. Stamen $\frac{3}{4}$ in. long. Fruit the size of a small cherry, orange-red. Fl. B. I. v. 6, p. 253; Grah. Cat. p. 206; Dalz. & Gibs. p. 274; Woodr. in Journ.

Bomb. Nat. v. 12 (1899) p. 521; K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 316; Prain, Beng. Pl. p. 1046; Watt, Diet. Econ. Prod. v. 1, p. 192.—Flowers: May. Vern. Kulinján.

KONKAN: Stocks!, Law!; S. Konkan, Nimmo ox Graham, Dalzell!; Wari country, truly wild on Wag-donger, Dalzell & Gibson. Kanana: N. Kanara, Talbot, 2552!—Distrib. Throughout India, often cultivated; Coylon, Malay Islands.

2. Alpinia Allhugas, Roscoe, in Trans. Linn. Soc. v. 8 (1807) p. 346. A stout perennial herb 3-6 ft. high; root tuberous, aromatic: Leaves 8-18 by 13-4 in., sessile or nearly so, linear-oblong or oblonglanceolate, acuminate, cuspidate, glabrous, base acute; sheaths long, glabrous, striate, compressed; ligule nearly 1 in. long, obtuse, glabrous. Flowers inodorous, pink, in erect, decompound, lax- or dense-flowered panicles 6-12 in. long, the branches short, ascending, with large narrowly linear deciduous floral leaves sometimes reaching 9 in. long, at the lower forks; rhachis pubescent or tomentose; pedicels short; bracts small, ovate, cupular. Calyx subcampanulate, $\frac{3}{3} - \frac{1}{2}$ in. long, pubescent, the mouth oblique, obtusely 2-3-toothed. Corolla-tube about as long as the calyx; lobes longer than the tube, linear-oblong, cymbiform, dorsally pubescent, shortly spurred below the hooded tip. Lip rather more than 1 in. long (including the slender claw), pink, obovate-cuneate or suborbicular, 2-fid, the margins waved and erose: claw as long as the limb, with 2 linear-subulate glands \(\frac{1}{16} \) in. long at Stamen arounte, shorter than the lip; connective not or obscurely crested. Style glabrous; stigma small. Fruit black, thin, globose, 3 in. in diam., irregularly rupturing. Seeds many, small, black, angular. Fl. B. I. v. 6, p. 253; Grah. Cat. p. 206; Dalz. & Gibs. p. 273; Trim. Fl. Ceyl. v. 4, p. 247; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521; K. Schum. in Eugler, Pflanzenreich, v. 4, part 46 (1904) p. 344; Prain, Beng. Pl. p. 1046; Watt, Diet. Econ. Prod. v. 1, p. 192 .- VERN. Taraka.

KONKAN: S. Konkan, Nimmo ex Graham.

Alpinia nutans, Roscoe, in Smith, Exot. Bot. v. 2 (1805) p. 93, t. 106, & in Trans. Linn. Soc. v. 8 (1807) p. 346. A very handsome plant grown commonly in gardens, a native of the Eastern Himalaya, Birma, Malay Islands and Peninsula; stem reaching 8-10 ft. high. Leaves 12-24 by 3-6 in., oblong-lanceolate. Flowers in panicles 6-12 in. long, with a very hairy rhachis; bracts large, concave, ivory-white with pink tips. Corolla white with a tinge of pink, the lip beautifully variegated with red and yellow. Fl. B. I. v. 6, p. 256; Grah. Cat. p. 206; Dalz. & Gibs. Suppl. p. 85; Roxb. in Asiat. Res. v. 11 (1810) p. 354; Fl. Ind. v. 1, p. 65; Watt, Diet. Econ. Prod. v. 1, p. 195. Globba nutans, Linn. Mantiss. 2 (1771) p. 170. Zerumbet speciosam, Wendl. Sert. Hann. v. 1, fasc. 4 (1798) t. 19. Alpinia speciosa, K. Schum. in Engl. Bot. Jahrb. v. 27 (1900) p. 284.—Vern. Puna-champa; Nág-damani.

DOUBTFULLY INDIGENOUS SPECIES.

ALPINIA CALCARATA, Roscoe, in Trans. Linn. Soc. v. 8 (1807) p. 347. Rootstock percunial, not tuberous. Leafing stem slender, 2-4 ft. high. Leaves 6-12 by 1-2 in., lanceolate, acuminate, green and glossy. Flowers numerous, large, in dense panicles

3-4 m. long, rhachis pubescent, bracts small, ovate. Calyx-tube funnel-shaped, \(\frac{1}{2}\)-\frac{1}{4} in long. Corolla-segments \(\frac{1}{2}\) in long. Lip 1-1\(\frac{1}{2}\) in long, ovate-oblong, sessile, yellow, streaked with purple veins, emarginate Ovary densely pubescent, ovules many in each cell Capsules globose, red. Fl B I v 6, p 254, Wight, Icon t 2028 (by error in Tab \(A\) nutans). Grah Cat p 206, Dalz & Gibs p 274, Trim Fl Coyl. v. 4, p 249; K Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p 338, Watt, Dict. Econ Prod v 1, p 192

The plant is a native of China and the S Malay Peninsula and is also given for Ceylon and the S Konkan in Hook f. Fl. B I l c. Trimen (l c) says he has not seen the plant in Ceylon otherwise than in garden, while the only authority for its presence in the S Konkan is Nimmo ex Graham (Oat Pl Bo l.c) Dalzell & Gibson have not found the plant wild, neither have any other Bombay botanists I think

therefore that its existence as a wild plant in the Konkan is very problematical.

10. PHRYNIUM, Willd.

Herbs usually with creeping rootstocks. Leaves large, oblong, radical; petioles long, sheathing, simulating stems. Flowers in spikes produced from the side of the petiole or direct from the rootstock; bracts 2-more-flowered. Sepuls 3, narrow. Corolla-tube cylindric, shorter or scarcely longer than the calyx; lobes linear-oblong, subequal, spreading. Staminal-tube longer than the corolla-tube; segments unequal, petaloid, one bearing a single marginal anther-cell. Ovary 3-celled; ovule usually solitary in each cell (rarely 2 of the cells empty); style adnate below to the staminal-tube, free and hooked above; stigma capitate or funnel-shaped. Fruit subglobose, indehiscent or taidly rupturing. Seeds 1-3, erect; aril short, fleshy; embryo curved.—Distrib. Species about 20, in the Tropics of the Old World.

- 1. Phrynium spicatum, Roxb. Hort. Beng. (1814) p. 1. Rootstock widely creeping, perennial, not tuberous. Leaves 2-4, oblong, 6-10 by 2-3 in., caudate-acuminate, base rounded; petioles slender, much longer than the blade. Flowers white, in short spikes $1-1\frac{1}{2}$ in. long; bracts $\frac{3}{4}$ in. long, orate, green. Sepals narrowly lanceolate, about $\frac{1}{4}$ in. long. Corolla-tube $\frac{3}{4}$ in long; lobes oblong, obtuse, $\frac{1}{4}$ in. long. Larger stammodes spathulate, $\frac{1}{3}$ in. long, the inner much smaller. Stamen with a rather large appendage. Fruit 3-seeded. Seeds $\frac{1}{4}$ in. long, 3-quetrous on the inner face, dull brown. Fl B. I. v. 6, p. 259; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521. Stachyphrynium spicatum, K. Schum. in Engler, Pflanzenreich, v. 4; part 48 (1902) p. 46. Rare Kondan Law'-Distrib Pegu
- 2. Phrynium capitatum, Willd. Sp. Pl. v. 1 (1797) p. 17. Rootstock tuberous, with many fleshy root-fibres. Leaves 12-18 by 6-8 in., oblong or oblong-lanceolate, acuminate, smooth on both sides, base rounded or cuneate; midrib slender; veins many, arched; petioles 2-3 ft. long, stout, terete; sheaths long, gieen. Flowers purplish, in capitate spikes 1½-2 in. in diam., sessile on the side of the petiole above the middle; outer bracts 2-3 at the base of the spike, large, rigid, with incurved scarious tips, breaking up into tufts of fibres; inner bracts closely imbricate, oblong, acute, 2-4-flowered; pedicels short. Sepals $\frac{2}{3}$ in. long, linear, hairy. Corolla about 1 in. long; tube slender, funnelshaped above; segments 3, purple, spathulate, recurved, the tips hairy.

3 c 2

Staminal-column 5-lobed, the 2 outer lobes larger, one orbicular, concave; filament adnate to the smaller segment; anther small. Ovary hairy; stigma funnel-shaped, hooked. Fruit size of a gooseberry, turbinate, 3-gonous, 3-valved. Seeds erect, subglobose; testa spongy; embryo curved. Fl. B. I. v. 6, p. 258; Grah. Cat. p. 212; Dalz. & Gibs. p. 271; Trim. Fl. Ceyl. v. 4, p. 263; K. Schum. in Engler, Pflanzenreich, v. 4, part 48 (1902) p. 53; Prain, Beng. Pl. p. 1049.

KONKAN: in shady jungles, Dalzell & Gibson.—Distrib. India (Bengal, Chota Nagpur, Travancore, W. Peninsula); Ceylon, Malaya.

11. MUSA, Linn.

Tree-like herbs with thick stems composed of convolute leaf-sheaths. Leaves very large, oblong. Flowers in subterminal stout spikes, the lower female, the upper male; bracts large, spathaceous, ovate or orbicular. Calyx tubular, spathaceous, slit down one side to the base, 3-5-lobed. Corolla a single convex membranous petal as long as the calyx and opposite its slit, embracing the base of the stamens and style. Stamens 5 perfect (6th rudimentary or 0); filaments erect, stout, filiform; anthers linear, erect, 2-celled. Ovary 3-celled; ovules many, superposed; style filiform from a thickened base; stigma subglobose, 6-lobed. Fruit large, oblong or fusiform, obtusely 3-5-angled, fleshy, indehiscent. Seeds embedded in pulp, subglobose or angled by pressure; m cultivated forms often obsolete.—Distrib. Species about 40, tropical.

1. Musa rosacen, Jacq. Hort. Schoenb. v. 4 (1804) p. 22, t. 445. Stem slender, cylindric, 3-5 ft. high, 3-4 in. in diam.; root perennial, stoloniferous. Leaves linear-oblong, firm in texture, petiolate. Flowers in drooping or erect spikes reaching 6 in. long; bracts few-flowered, ovate, hlac or reddish, about 6 in. long, oblong. Calyx about 1 in. long, yellowish-white, 5-toothed. Petal as long as the calyx. Fruit linear-oblong, slightly incurved, obscurely 4-5-nngled, of the size of a man's finger, firm, not edible. Seeds many, black, tuberculate. Fl. B. I. v. 6, p. 263; Bot. Reg. t. 706; K. Schum. in Engler, Pflanzenreich, v. 4, part 45 (1900) p. 24. Musa ornata, Roxb. Hort. Beng. (1814) p. 19; Dalz. & Gibs. p. 272; Prain, Beng. Pl. p. 1050; Watt, Dict. Econ. Prod. v. 5, p. 290.

Grows in almost inaccessible places on the sides of precipitous crags in the Konkan hills.—Distrib. India (Eastern Himalaya, Chota Nagpur, Chittagong, W. Peninsula); Java.

2. Musa superba, Roxb. Hort. Beng. (1814) p. 19. Whole plant 10-12 ft. high; trunk not stoloniferous, 7-8 ft. in circumference at the base, narrowed to 3 ft. below the leaves. Leaves 5-10 by 2-3 ft., oblong, narrowed to the base; free petioles short. Flowers in 2 dense rows of 10-15 each, arranged in spikes which are at first globose, 1 ft. in diam., finally drooping and \(\frac{1}{3}\) the length of the trunk; bracts orbicular, reaching 1 ft. long and broad, dull claret-brown. Calyx 1-1\(\frac{1}{2}\) in. long; lobes 3, linear, loosely cohering. Petal \(\frac{1}{2}\) in. long, pale, almost pellucid, the apex 3-lobed, the 2 side lobes rounded, the midlobe long,

linear. Fruit oblong, subcoriaceous, 3 by $1\frac{1}{2}$ in., nearly dry when ripe. Seeds numerous, subglobose, angled by pressure, $\frac{1}{3}-\frac{1}{2}$ in. in diam., smooth, brown or black. Fl. B. I. v. 6, p. 261; Dalz. & Gibs. p. 272; Roxb. Cor. Pl. t. 223; Wight, Icon. tt. 2017-18; R. Graham, in Bot. Mag. tt. 3849-3850; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521; K. Schum. in Engler, Pflanzenreich, v. 4, part 45 (1900) p. 16; Watt, Dict. Econ. Prod. v. 5, p. 302. Musa textilis, J. Grah. Cat. Pl. Bo. (1839) p. 213 (not of Née).—Vern. Chowáni.

Widely spread throughout the Western Ghats.

Musa textilis, Luis Née, in Ann. Ciénc. Nat. v. 4 (1801) p. 123. Stem cylindric, green, 20 ft. or more high, stoloniferous from the base. Leaves oblong, deltoid at the base, bright green above, rather glaucous beneath, smaller and firmer in texture than those of Musa sapientum; petioles 1 ft. long. Spike drooping, shorter than the leaves; male flowers deciduous; bracts polished outside. Fruit green, 2-3 by 1 in., 3-gonous, curved, with numerous seeds, not edible. Seeds turbinate, black, \(\frac{1}{6} \) in in diam., angled by pressure. Fl. B. I. v. 6, p. 263; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521, & Gard. in Ind. ed. 5, p. 489; Watt, Dict. Econ. Prod. v. 5, p. 302; K. Schum. in Engler, Pflanzenreich, v. 4, part 45 (1900) p. 19. The plant is a native of the Philippines and furnishes the well-known Manilla Hemp. It has been introduced into India in several places, but has not proved a commercial success.

Musa coccinea, Andr. Bot. Rep. (1799) t. 47. Stem stoloniferous, slender, about 4 feet high, with oblong leaves 36 by 6 in. and spikes of flowers enclosed in bright scarlet bracts. A native of S. China and Cochinchina, grown in gardens as an ornamental plant. Woodr. Gard. in Ind. ed. 5, p. 488; K. Schum. in Eugler, Pflanzenreich, v. 4, part 45 (1900) p. 23.

Musa sumatrana, Beccari, in Illustr. Hortic. v. 27 (1880) p. 37, t. 375. Whole plant 7-8 ft. high. Leaves with irregular blotches of claret-brown. A native of Sumatra, grown as an ornamental plant in conservatories. Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521, & Gard. in Ind. ed. 5, p. 484; K. Schum. in Engler, Pflanzenreich, v. 4, part 45 (1900) p. 24.

Musa Ensete, J. F. Gmel. Syst. v. 2 (1791) p. 567. A very large species. Whole plant 30-40 ft. high; leaves oblong, acute, sometimes 20 by 3 ft. with a red midrib; bracts 9-12 in. long, dark claret-brown. A native of Abyssinia, the largest Musa known, grown as an ornamental plant in gardens. Its chief characteristic is the bright red of the massive midribs of the leaves. Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521, & Gard. in Ind. ed. 5, p. 489; K. Schum. in Engler, Pflanzenreich, v. 4, part 45 (1900) p. 15.

Musa zebrina, Van Houtte, ex Planch. in Flor des Serres, v. 10 (1854-55) p. 223. Whole plant 5-10 ft. high. Leaves oblong-lanceolate, green, striped with dark bands above, red beneath, a native of the Malay Peninsula, grown as an ornamental plant in gardens.

Baker (Fl. B. I. v. 6, p. 263) has made this a variety of Musa supientum, to which Ridley objects and considers that it should more properly be made a variety of M. malaccensis, Ridley, or of M. sumatrana, Beccari. Musa sapientum var. zebrina, Bak. in Hook. f. Fl. B. I. v. 6, p. 263; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521. Maranta zebrina, Grah. Cat. p. 212.

Musa chinensis, Sweet, Hort. Brit. ed. 2 (1830) p. 596. Whole plant 4-6 ft. high; leaves 6-8 in a dense rosette, spreading, oblong, 2-3 by 1 ft.; petioles short, stout, deeply channelled, with broad crisped green edges. Spike dense, 1-2 ft. long; bracts red-brown; male flowers persistent. Fruit 6-angled, 4-5 in. long, yellow, with a thick skin, of inferior flavor until dead ripe, when it is rich. Musa Cavendishii, Lambert, ex Paxt. Mag. Bot. v. 3 (1837) p. 51; Woodr in Journ. Bomb. Nat. v. 12 (1899) p. 521, & Gard. in Ind. ed. 5, p. 486; K. Schum. in Engler, Pflanzenreich, v. 4, part 45 (1900) p. 17. A native of S. China, extensively cultivated in tropical and subtropical countries and known as the Chinese or Dwarf Banana.—Verns. Gugi.

Musa paradisiaca, Linn. Sp. Pl. (1753) p. 1043. Stoloniferous; trunk cylindric, reaching 25 ft. or more, with a diameter of 6 in. Leaves oblong, green, reaching 8 ft. long and 2 ft. broad. Inflorescence pendulous, reaching 4 ft. long; male flowers and bracts subpersistent. Fruit cylindric, up to 12 in. long, generally yellowish or yellowish-green when ripe, the pulp scarcely sweet, rather firm, not fit to eat without cooking. Trim. Fl. Ceyl. v. 4, p. 265; K. Schum. in Engler, Pflanzenreich, v. 4, part 45 (1900) p. 19. Musa paradisiaca var. normalis, O. Kuntze, Revis. Gen. v. 2 (1891) p. 692. Musa Olifortiana, Linn. Sp. Pl. (1753) p. 1043 in syn. M. sapientum var. paradisiaca, Baker, in Ann. Bot. v. 7 (1893) p. 213, & in Hook. f. Fl. B. I. v. 6, p. 262; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521; Prain, Beng. Pl. p. 1050; Watt, Dict. Econ. Prod. v. 5, p. 292.

The well-known Plantain or Banana, usually known by the former name in India, many varieties of which are cultivated for their fruit throughout the tropics. Its native country is uncertain, but it is probably of Asiatic origin. I have followed O. Kuntze and K. Schumann in making M. paradisiaca, Liana, the type and M. sapientum, Linn., the subspecies or variety. Mr. Baker (Ann. Bot. l. c.) has made M. sapientum the type and M. paradisiaca a subspecies, but he has done so apparently under the mistaken notion that the names of both plants occurred for the first time in Linnæus's Sp. Pl. ed. 2 (1763) p. 1477, where they appear together. As a matter of fact, however, Musa paradisiaca appears for the first time in Linnæus's first edition (1753) on page 1043, in which M. sapientum does not occur at all, while Musa sapientum appears for the first time in Linn. Syst. ed. 10 (1759) p. 1303, where M. paradisiaca occurs above it. As M. paradisiaca has 6 years' priority to M. sapientum, there can be no question that to make it a subspecies of the latter would, unless some very cogent reason could be assigned, be somewhat anomalous.

Subspecies supientum, K. Schum, in Engler, Pflanzenreich, v. 4, part 45 (1900) p. 20. Male flowers and bracts deciduous; fruit oblong, usually 3-gonous, yellow or reddish when ripe, the pulp sweet and edible without cooking. Musa paradisiaca var. sapientum, O. Kuntze, Revis. Gen. v. 2, p. 692. M. sapientum (sp.), Linn. Syst. ed. 10 (1759) p. 1303; Baker, in Hook, f. Fl. B. I. v. 6, p. 262; Grab. Cat. p. 212; Dalz. & Gibs. Suppl. p. 88; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521; Prain, Beng. Pl. p. 1050; Watt, Dict. Econ. Prod. v. 5, p. 290.—Vern. Kela.

VAR. vittata, Hook in Bot. Mag. t. 5402. Leaves and long fruits striped with white; bracts bright red inside. Imported from the Island of St. Thomas (W. Africa) and grown as an ornamental plant in gardens. Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521, & Gard. in Ind. ed. 5, p. 489; K. Schum. in Engler, Pflanzenreich, v. 4, part 45 (1900) p. 21.

Several forms or varieties of the subspecies (M. sapientum) are cultivated in W. India for their fruit. Of these the chief are the following, which, with the vernacular names by which they are known, have been taken from Woodrow's Gard. in Ind. ed. 5, p. 486:—

Raj-kel; Rám-kela; Lál-kela. Stem very strong, reddish, of medium height; leaves with red midrib and edges; fruit very large, subcylindric, red-skinned, of luscious flavor. Grown largely about Bassein, 30 miles N. of Bombay.

Son-kel (var. Champa, Hort.). Stem very tall, weak; leaves thin, large; fruit small, subcylindric, yellow, thin-skinned, of excellent flavor. Considered to be the best of the plantains grown in the Bombay Presidency.

Gossavi. Stem of medium height; fruit of medium size, yellow, thinskinned, of superior flavor.

Botatti. Stem tall, stout; fruit 3-gonous, thick-skinned, yellow, of sweet flavor.

Lokandi. Stem 10 ft. high, reddish, stont; leaves thick, large; fruit long, subcylindric, yellow, with moderately thick skin, and of superior flavor.

The following plants not belonging to any of the foregoing genera are grown as useful or ornamental plants:—

Heliconia angustifolia, Hook. Bot. Mag. (1849) t. 4475. A native of Brazil, grown as an ornamental plant in gardens; leaves with long petioles gracefully arching; flowers white with greenish tips; bracts scarlet, lauceolate, acuminate. K. Schum. in Engler, Pflanzenreich, v. 4, part 45 (1900) p. 39. Heliconia bicolor, Benth. in Maund, Bot. v. 3, t. 101; Woodr. Gard. in Ind. ed. 5, p. 490.

Heliconia metallica, Planch. & Linden, in Bot. Mag. (1862) t. 5315. A native of New Granada. Leaves elegantly drooping and recurved, broadly lanceolate, the underside, midrib, margins and curving veins of a dark bronzy red; flowers scarlet. Woodr. Gard. in Ind. ed. 5, p. 490. Heliconia vinosa, Bull, Cat. (1871) p. 5.

Heliconia Bihai, Linn. Mantiss. v. 2, p. 211. A native of the West Indies, introduced by Nimmo in 1833. It reaches about 12 ft. high, with ovate-lanceolate leaves on long petioles and red or orange bracts enclosing the flowers. Woodr. Gard. in Ind. ed. 5, p. 490. Heliconia buccinata, Roxb. Hort. Beng. (1814) p. 19; Grah. Cat. p. 213; Dalz. & Gibs. Suppl. p. 89; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521.

Ravenala madagascarensis, Sonnerat, Voy. v. 3 (1782) Bk. 5, p. 244. A very elegant tree known as the Traveller's Tree, with plantain-like leaves on long petioles forming a fan-like head; flowers white. A native of Madagascar, grown in gardens, but it does not thrive at any great distance from the coast. Fl. B. I. v. 6, p. 198; K. Schum. in Engler, Pflanzenreich, v. 4, part 45 (1900) p. 29, fig. 6; Prain, Beng. Pl p. 1050. Urania speciosa, Willd. Sp. Pl. v. 2 (1799) p. 7; Grah. Cat p. 213; Dalz. & Gibs. Suppl. p. 89.

Canna indica, Linn. Sp. Pl. (1753) p. 1. Rootstock tuberous with many fibres; stem 3-4 ft. high. Leaves 6-18 by 4-8 in., oblong-of elliptic-lanceolate, caudate-acuminate. Flowers rather distant, 2-2½ in long, scarlet or yellow. Fruit erect, ½-1 in. long, subglobose or oblong obscurely 3-lobed. Seeds the size of a pea, spherical; testa crustaceous black, shining. The seeds are commonly known as the Indian Shot Flowers more or less throughout the year. In gardens in the Bomba Presidency very common, but not indigenous. Fl. B. I. v. 6, p. 260 Grah. Cat. p. 211; Dalz. & Gibs. Suppl. p. 88; Woodr. in Journ. Bomb Nat. v. 12 (1899) p. 521; Prain, Beng. Pl. p. 1047; Watt, Dict. Econ. Prod. v. 2, p. 102.

Elettaria Cardamonum, Maton, in Trans. Linn. Soc. v. 10 (1811) p. 254. Rootstock woody or fleshy, branching; stem 6-9 ft. high, clothed below with spongy sheaths. Leaves subsessile, 1-2 ft. by 3 in., oblong-lanceolate. Panicles several to one leafy stem, 1-2 ft. long; bracts linear-oblong, persistent, 1½-2 in. long. Calyx ½ in. long. Lip of corolla white, streaked with violet. Capsules subglobose or oblong, about ½ in. long, marked with many fine vertical ribs. Fl. B. I. v. 6, p. 251; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521, & Gard. in Ind. ed. 5, p. 482: K. Schum. in Engler, Pflanzenreich, v. 4, part 46 (1904) p. 268; Watt, Diet. Econ. Prod. v. 3, p. 227. Alpinia Cardamonum, Roxb. in Asiat. Res. v. 11 (1810) p. 355; Grah. Cat. p. 206; Dalz. & Gibs. Suppl. p. 86.—Flowers: Jan. Vern. Elchi; Elachi.

The Cardamom; cultivated in the hilly tracts of N. Kanara and in many parts of S. India. A very full description may be found in Watt's Dictionary, l. c.

ORDER CXXVII. BROMELIACEÆ.

Of this Order there exists but one representative in the Bombay Presidency, the Pine Apple, Ananas sativus, Schult., a native of Tropical America, often cultivated. Ananas sativus, Schult. f. Syst. v. 7 (1830) p. 1283; Watt, Dict. Econ. Prod. v. 1, p. 236. Ananassa sativa, Lindl. Bot. Reg. v. 13 (1827) sub t. 1068; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521; Prain, Beng. Pl. p. 1052. Bromelia Ananas, Linn. Sp. Pl. (1753) p. 285; Grah. Cat. p. 222; Dalz. & Gibs. Suppl. p. 94; Bot. Mag. t. 1554.—Flowers: Jan.-Mar. Veen. Ananas.

ORDER CXXVIII. HÆMODORACEÆ.

Perennial herbs; rootstock short, tuberous, with usually fascicled root-fibres. Leaves usually radical, often distichous, narrow, with equitant sheaths; nerves parallel. Flowers hermaphrodite, regular or nearly so, in terminal spikes, racemes or panicles. Perianth corolline, 2-seriate; lobes 6, imbricate or induplicato-valvate. Stamens 6, opposite or more or less adnate to the perianth-lobes, or fewer; anthers erect or versatile, 2-celled, rarely opening by pores. Ovary inferior or sub-inferior, perfectly or imperfectly 3-celled; ovules 1 or more, attached to the inner angle of the cells; style filiform (rarely short or obsolete); stigma simple or 3-notched. Fruit a superior or nearly superior locu-ilicidal capsule, or an inferior indehiscent berry tipped by the perianth. Seeds various; embryo small, partially enclosed in fleshy albumen.—Distrib. Genera 26; species about 120, in Australia, S. Africa, N. and S. America, Central and Eastern Asia.

1. **OPHIOPOGON**, Ker-Gawl.

Scapigerous herbs. Stems short from a short rootstock, or elongate and subscandent. Leaves linear or lanceolate, parallel-nerved. Flowers in racemes; scape leafy or naked; bracts scarious, usually manyflowered. Perianth superior; segments spreading. Stamens 6, on the bases of the perianth-segments; filaments short, erect; anthers basifixed. Ovary inferior, 3-celled, the crown flat or depressed; ovules 2 in each cell, collateral, erect, anatropous; style columnar; stigma 3-toothed. Fruit indehiscent. Seeds few; testa fleshy or succulent.—Distrib. Species 8 or 10, East Asiatic.

1. Ophiopogon intermedius, Don, Prodr. Fl. Nep. (1825) p. 48. Var. pauciflora, Hook. f. Fl. B. I. v. 6 (1892) p. 269. Rootstock short. Leaves 6-20 by \(\frac{1}{6}\)-\frac{1}{3} in., linear, acute or acuminate, dark green above, paler beneath. Flowers white, rather distant, in lax racemes 1-2 in. long, on very long slender scapes 4-10 in. long; bracts narrowly lanceolate, variable in length, sometimes as much as \(\frac{1}{2}\) in. long; pedicels \(\frac{1}{10}\)-\frac{1}{6}\) in. long. Perianth campanulate, \(\frac{1}{4}\) in. long; segments \(\frac{1}{6}\) by \(\frac{1}{10}\) in., elliptic-oblong, obtuse. Anthers narrowly oblong. Seeds subglobose, \(\frac{1}{3}\) in. in diam., crowded round and almost concealing the small withering pericarp; testa soft, blae. Ophiopogon intermedius, Trim. Fl. Ceyl. v. 4, p. 267; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 521. O. indicus, Wight, Icon. v. 6 (1853) p. 26, t. 2050.—Flowers: Sept.

Not common. Dalzell without locality in Herb. Kew.!; Slocks without locality in Herb. Kew.! Deccan: Mahableshwar, Woodrow.—Distrib. India (Khasia Hills, W. Peninsula); Ceylon.

Sansevieria zeylanica, Willd. Sp. Pl. v. 2 (1799) p. 159. Stem very short. Leaves about 8 or 9 in a tuft, $2\frac{1}{2}$ -3 ft. long by 1 in. broad towards the middle, suberect, rigid, pale green with transverse bands of dark green, $\frac{1}{4}$ in. thick, with a terete rigid spine-like tip 1-2 in. long. Flowers greenish-white tinged with violet, in fascicles of 3-6 on long racemes 1-2 ft. long.

The Bow-string Hemp, sometimes but not very commonly grown in gardens. It does not produce seed in the Bombay Presidency. The fibre is excellent and very strong, used for fishing-lines and bow-strings. Grah. Cat. p. 218; Dalz. & Gibs. Suppl. p. 91; Trim. Fl. Ceyl v. 4, p. 267; Roxb. Cor. Pl. v. 2, p. 43, t. 184; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522; Watt, Dict. Econ. Prod. v. 6, part 2, p. 460. Sansevieria Roxburghiana, Schultz, f. Syst. v. 7 (1829) p. 357; Hook. f. Fl. B. I. v. 6, p. 271; Bot. Mag. t. 7487; Prain, Beng. Pl. p. 1054.—Flowers: Jan. Vern. Murba; Murva; Naghin.

DISTRIB. India (usually cultivated; said to be indigenous on the Coromandel-coast); Ceylon, Java, China, Africa.

Sansevieria cylindrica, Boj. Hort. Maurit. (1837) p. 349. The tercte-leaved Bow-string Hemp, a native of Tropical Africa. Leaves terete, quite solid; flowers cream-white tinged with pink, in fascicles along the rhachis of a long raceme. Occasionally cultivated in gardens. Hook. in Bot. Mag. t. 5093; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522; Prain, Beng. Pl. p. 1054.

EXCLUDED SPECIES.

PELIOSANTHES NEILGHERRENSIS, Wight, Icon. v. 6 (1853) p. 26, t. 2052. Leaves membranous, 3-8 in a tuft from the base of the plant, 4½-8 by 3-14 in., oblong-lanceolate, acuminate, base acute; norves slender, 10-15, of which 5 are stronger than the others, the transverse nervules conspicuous; petioles 4-8 in. long, slender. Flowers dark purple, measuring 3 in. across when spread out, secund, in racemes 8-12 in. long (including the scape); bracts 1-flowered, ovate-lanceolate, acuminate, scarious, the tips inflexed, the lower bracts reaching ½ in., the upper 72-½ in. long; pedicels ½-½ in. long, articulated at the apex, cernuous. Perianth-segments 6, oblong, obtuse, about ½ in. long. Mouth of corona 6-toothed. Stigma 3-lobed. Seeds obturbinately ovoid, ½-½ in. long. Fl. B. I. v. 6, p. 266; Woodr, in Journ. Bomb. Nat. v. 12 (1899) p. 521; Baker, in Journ. Linn. Soc. v. 17 (1880) p. 503.

In the 'Flora of British India' Kanara is given as a habitat of this plant on Wight's reputed authority. Woodrow in his list of Bombay Plants copies the 'Flora of British India' and also gives Kanara, Wight. But Wight does not anywhere give Kanara as a habitat. In his 'Icones' (l. c.) he gives Sispara, and Steudel (Herb. No. 1306) also gives Sispara, which is on the Nilghiris at an elevation of about 6000 feet. There is absolutely no evidence of the existence of the plant in the Bombay Presidency.

ORDER CXXIX. AMARYLLIDACEÆ.

Perennial herbs (rarely shrubs or undershrubs). Rootstock a bulb, tuber or corm, rarely an erect stock. Leaves radical. Scape naked (in the Indian genera). Flowers few, often umbellate; bracts membranous or colored (rarely herbaceous), the outer under the umbel 1-3 (rarely many) -involucrate; occasionally the inflorescence racemose or paniculate with scattered bracts. Perianth regular or irregular, 2-seriate, 6-lobed or -partite, sometimes with a corona at the mouth of the tube. Stamens 6, adnate to the bases of the perianth-segments, rarely epigynous; filaments free or connate; anthers erect or versatile. Ovary 3-celled, inferior; ovules many, anatropous, 2-seriate on the inner angles of the colls; style slender; stigma simple or 3-cleft. Fruit inferior, usually

a loculicidal capsule, rarely fleshy and bursting in regularly. Seeds few or many; albumen fleshy, enclosing the small embryo.—Distrib. Genera 64; species about 650, in temperate and tropical regions.

Rootstock tuberous, leaves strongly nerved, flat or plicate, flowers spicate or racemose, perianth yellow, not showy Fruit opening at the top as a circumscissile or 3-valved capsule, ovary not produced above the crown into a stipe supporting the perianth 1. Hyroxis Fruit indehiscent, ovary often produced into a stipe between the crown and the base of the perianth-lobes 2. Curculigo. Rootstock a tunicated bulb, leaves not strongly nerved, flat, smooth, flowers at the apex of a scape, usually umbeliate, perianth white or pink, not jellow, large and showy. Filaments attached to the perianth-lobes but not connate . 3 CRINUM Filaments united towards their base by an intervening petaloid membrane 4. PANCRATIUM.

1. **HYPOXIS**, Linn.

Herbs with a tuberous rootstock or a tunicate membranous or fibrous corm. Leaves narrow, radical, strongly nerved. Flowers solitary, or racemose, or umbellate; bracts small, linear, or obsolete. Perianth rotate, 6-partite, persistent, sessile on the top of the inferior ovary. Stamens 6, adnate to the base of and shorter than the perianth-segments; filaments short; anthers erect, dorsifixed. Ovary inferior, 3-celled; ovules many, 2-seriate in each cell; style short, columnar; stigmas 3, erect, stout, distinct or connate. Fruit a globose or oblong capsule, opening by 3 valves or circumscissilely. Seeds globose; testa crustaceous, shining, beaked at the tip.—Distrib. Species about 50, widely diffused but rare in Asia; numerous in S. Africa.

1. Hypoxis aurea, Lour. Fl. Cochinch. (1790) p. 200. Dioccious; rootstock subglobose, or elongate and erect, crowned with the fibrous remains of old leaves. Leaves 6-12, narrowly linear, 4-14 by $\frac{1}{10} - \frac{1}{6}$ in., subcoriaceous, acute, keeled. Scapes 1-4, fillform, 1-4 in. long, 1 (less commonly 2) -flowered, nearly glabrous or sparsely clothed with pale brown hairs; bracts setaceous. Ovary broadly clavate, $\frac{1}{3} - \frac{1}{4}$ in. long, clothed with golden-brown short shining hairs. Perianth-segments $\frac{1}{4} - \frac{1}{3}$ in. long, thinly hairy, elliptic-lanceolate, yellow, the outer green at the back. Anthers sagittate. Capsules with thin walls, oblong or clavate-oblong, $\frac{1}{4} - \frac{1}{2}$ in. long, ultimately 3-valved, crowned with the erect perianth-segments. Seeds black, finely tuberculate. Fl. B. I. v. 6, p. 277; Baker, in Journ. Linn. Soc. v. 17 (1880) p. 108; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522; Prain, Beng. Pl. p. 1058. Curculigo graminifolia, Nimmo, ex Grah. Cat. Pl. Bo. (1839) p. 215; Dalz. & Gibs. p. 276.—Flowers: July.

Konkan Shiynar Fort, Dalzell of Gibson Deccan: Dalzell, 10; Khandala, Graham, Dalzell of Gibson, Woodrow, Purandhar, Dr. Barnes', Mahableshwar, H. M. Birdwood. S. M. Country Belgaum, Ritchic, 1443', Talbot, 2276! Kanara: Law!—Distrib Throughout India in hilly parts, Java, China, Japan, Philippines.

2. CURCULIGO, Gærtn.

Herbs with a tuberous rootstock or a tunicate com. Leaves lanceolate and plicate, or linear and flat, often large. Flowers spicate, racemose or subcapitate, the lower flowers usually 2-sexual, the upper often male. Perianth 6-partite, separated from the ovary by a short or long solid stipe bearing the rotate limb. Stamens 6, adnate to the base of the perianth-lobes; filaments short; anthers linear, erect. Ovary inferior, 3-celled, with a short or long beak; ovules 2 or more in each cell, with a distinct, often long funicle; style short, columnar; stigmas 3, oblong, erect, appressed. Fruit an indehiscent berry. Seeds subglobose; testa crustaceous, black, often beaked.—Distrib. Species about 12, tropical.

1. Curculigo orchioides, Gartn. Fruct. v. 1 (1788) p. 63, t. 13. Rootstock stout, short or elongate (sometimes 1 ft. long), with copious fleshy root-fibres. Leaves sessile or petiolate, 6-18 by ½-1 in., linear or linear-lanceolate, membranous, plicate, glabrous or sparsely softly hairy, the tips sometimes rooting and reaching the ground, base sheathing. Scape very short, clavate, flattened, with the pedicels, bracts, and ovary hidden among the leaf-sheaths. Flowers bright-yellow, distichous, the lowest in the raceme 2-sexual, the upper male; bracts lanceolate, Perianth-segments \(\frac{1}{2} - \frac{2}{3}\) in. long, elliptic-oblong, acute, membranous. hairy on the back, the stipes (the long sleuder beak of the ovary) very slender, 1-1 in. long, which alone with the perianth appears above ground. Stamens small; filaments very short; anthers linear. Ovary lanceolate, the cells 6-8-ovulate; stigma 3-cleft. Capsules 1 in. long, hypogeous, 1-4-seeded, with a slender beak; septa spongy. Seeds oblong; testa deeply grooved in wavy lines, black, shining. Fl. B. I. v. 6. p. 279; Grah. Cat. p. 215; Trim. Fl. Ceyl. v. 4, p. 269; Roxb. Cor. Pl. v. 1 (1795) p. 14, t. 13; Bot. Mag. t. 1076; Baker, in Journ. Linn. Soc. v. 17 (1880) p. 124; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522; Prain, Beng. Pl. p. 1059; Watt, Dict. Econ. Prod. v. 2, p. 650. Curculigo malabarica, Wight, Icon. v. 6 (1853) p. 22, t. 2043, fig. 1; Dalz. & Gibs. p. 276. Curculigo brevifolia, Dryand. in Ait. Hort. Kew. ed. 2, v. 2 (1811) p. 253; Wight, Icon. t. 2043, fig. 2; Grah. Cat. p. 215; Dalz. & Gibs. p. 276.

Korken: Law!; S. Konkan, Nimmo ex Graham. Drecan: Mahableshwar, Graham, Dalzell & Gibson, H. M. Birdwood. Kanara: Law!—Distrin. India (Bengal, Assam, W. Peninsula); Java.

Curculigo recurvata, Dryand. in Ait. Hort. Kew. ed. 2, v. 2 (1811) p. 253. Leaves large, 2-3 ft. by 3-6 in., lanceolate, plicate; petiole 1 ft. long; flowers yellow, \$\frac{1}{3}\$ in. across, in heads 2-4 in. in diam. Occasionally grown in gardens, a native of the Tropical Himalaya, Bengal, Birma, Malay Islands, China, and Australia. Fl. B. I. v. 6, p. 278; Bot. Reg. t. 770; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522; Prain, Beng. Pl. p. 1059.

3. CRINUM, Linn.

Herbs with large tunicated bulbs, the bulbs often produced into a long or short neck. Leaves numerous, elongate, lorate or ensiform. Scape solid. Flowers large, umbellate; bracts 2, spathe-like; bracteoles linear. Perianth funnel- or salver-shaped; tube long, straight or incurved; lobes 6, linear-lancoolate or oblong, spreading or conniving.

Stamens 6, on the throat of the perianth-tube; filaments free, filiform; anthers linear, dorsifixed. Ovary 3-celled; ovules few or many in a cell; style filiform; stigma minute, subcapitate. Capsule irregularly subglobose, membranous or coriaceous, bursting irregularly. Seeds few, large, rounded; testa thick; albumen copious, fleshy.-Distrib. Tropical Asia, Africa, Australia, and America; species about 75.

Perianth erect, salver-shaped; lobes stellately patent; stamens very long, spreading.

Perianth-lobes linear.

Leaves 5-7 in. wide; umbels 15-20-flowered; perianthtube 3-4 in. long Leaves 3-1 in. wide; umbels 6-12-flowered; perianth-tube 23-3 in. long....

Perianth-lobes lanceolate.

Leaves 1-2 in. wide; flowers subsessile; bracts 2-3 in.

Leaves 3-4 in. wide; pedicels 1 in. long; bracts less than 2 in. long Perianth funnel-shaped; tube curved; lobes oblong or lanceolate; stamens very long, declinate; style longer than the Perianth nodding, funnel-shaped; stamens very short; fila-

ments 1 in. long; style shorter than the filaments, included

1. C. asiaticum.

C. defixum.

3. C. pratense.

4. C. Woodrowi.

5. C. latifolium.

6. C. brachynema.

1. Crinum asiaticum, Linn. Sp. Pl. (1753) p. 292. Bulb 2-4 in. in diam., narrowed into a neck 6-12 in. long, which is clothed with old leaf-sheaths. Leaves 20-30, thin, 3-5 ft. by 5-7 in., linear-lanceolate, shortly acuminate, flat, narrow, with a sheathing base, bright-green with smooth margins. Scape 1½-3 ft., reaching 1 in. in diam. Flowers white, fragrant at night, 15-50 in an umbel; bracts 3-4 in. long; pedicels 1-1 in. long. Perianth-tube greenish-white, 3-4 in. long, cylindric, slender; lobes nearly as long as the tube, linear, recurved or revolute. Stamens reddish; filaments slender, shorter than the lobes of the perianth; anthers $\frac{1}{2}$ - $\frac{3}{4}$ in. long. Fruit subglobose, 1-2 in. in diam., 1 (rarely 2) -seeded, beaked by the fleshy base of the perianth, dehiscing irregularly. Fl. B. I. v. 6, p. 280; Grah. Cat. p. 215; Dalz. & Gibs. p. 275; Baker, Handb. Amaryllid. (1888) p. 75; Bot. Mag. t. 1073; Trim. Fl. Ceyl. v. 4, p. 270; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522; Prain, Beng. Pl. p. 1060. Crinum asiaticum var. toxicaria, Watt, Dict. Econ. Prod. v. 2, p. 589. Crinum toxicarium, Roxb. Fl. Ind. v. 2 (1832) p. 134; Wight, Icon. tt. 2021-2; Grah. Cat. p. 216.-VERN. Nagdaun.

Often cultivated in gurdens, but rather doubtfully indigenous. Konkan: N. & S. Konkan, Graham, Dalzell & Gibson.

2. Crinum defixum, Ker-Gawl, in Journ. Sci. & Arts, v. 3 (1817) p. 105. Bulb ovoid, 2-3 in. in diam., with a fusiform stoloniferous base; neck 2-6 in. long, cylindric. Leaves 6-8 to a bulb, 2-3 ft. by 3-1 in., linear, deeply channelled down the face, obtuse or acute, concave, thick, dark-green, with slightly rough margins. Scapes from the axils of the lowest leaves, $1\frac{1}{2}-2\frac{1}{2}$ ft. long, erect, cylindric; bracts 2, oblong-lanceolate, subacute, $1\frac{1}{2}-2$ in. long; bracteoles filiform. Flowers white, fragrant at night, in 6-12-flowered umbels; pedicels very short. Perianth-tube 2½-3 in. long, slender, cylindric; lobes nearly as long as

the tube, narrowly linear. Filaments shorter than the lobes of the perianth, spreading, bright-red; anthers ½ in. long. Style declinate; stigma simple. Fruit subglobose, 1-1} in. in diam., shortly pedicellate, beaked by the perianth-tube, 1-celled, 1- or more-seeded. Seeds rugose. Fl. B. I. v. 6, p. 281; Bot. Mag. t. 2208; Trim. Fl. Ceyl. v. 4, p. 271; Baker, Handb. Amaryllid. (1888) p. 76; Prain, Beng. Pl. p. 1060; Watt, Diet. Econ. Prod. v. 2, p. 590. Crinum Roxburghii, Dalz. & Gibs. Bo. Fl. (1861) p. 275. C. ensifolium, Roxb. Hort. Beng. (1814) p. 23; Fl. B. I. v. 6, p. 281; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522. C. asiaticum, Roxb. Fl. Ind. v. 2 (1832) p. 127 (not of Linn.).— Flowers: Aug.-Sept.

Ritchie, 1444, without locality in Herb. Kew.! Konkan: N. & S. Konkan, Law! S. M. Countay: Bolgaum, Ritchie, 724! Kanara: Kala naddi, Ritchie, 724!

3. Crinum pratense, Herbert, Amaryllid. (1837) p. 256. Bulb ovoid, 4-5 in. in diam.; neck 2-2½ in. long. Leaves 6-8 to a bulb, 1½-2 ft. by 1-2 in., narrowed towards the obtuse or subacute apex, linear, suberect, channelled down the face, the margins entire or ciliolate. Scape lateral, compressed, 12 in. or more long and about ½ in. in diam. Flowers fragrant, 6-12 in an umbel, subsessile; bracts large, 2-3 in. long, ovate-deltoid, acute. Perianth-tube greenish, 3-4 in. long, at first curved; lobes lanceolate, white, about as long as the tube, ½ in. broad. Filaments bright-red, rather shorter than the perianth-lobes. Ovules 3-4 in each cell. Fl. B. I. v. 6, p. 282; Baker, Handb. Amaryllid. (1888) p. 82; Prain, Beng. Pl. p. 1060; Watt, Dict. Econ. Prod. v. 2, p. 590. Crinum longifolium, Roxb. Hort. Beng. (1814) p. 23.

Dalzell without locality in Herb. Kew.! S. M. Country: Belgaum, on banks of nalas, Ritchie, 1445!—Distrib. Plains of India and Birma.

4. Crinum Woodrowi, Baker, in Bot. Mag. (1898) t. 7597. Bulb globose, 4 in. in diam., without any produced neck; outer tunics brown, membranous. Leaves 1 ft. by 3-4 in., few, contemporary with the flowers, linear, obtuse, glabrous, bright-green, not ciliate on the margin. Scape arising from the bulb outside the tuft of leaves, stout, compressed, 1 ft. long. Umbels 6-7-flowered; pedicels about 1 in. long; bracts 1½-1¾ in. long, ovate, acute. Perianth-tube 3-3½ in. long, cylindric, greenish; lobes white, as long as the tube, lanceolate, spreading equally. Filaments bright-red, shorter than the perianth-lobes; anthers linear, ¼ in. long, yellow. Style overtopping the stamens. Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522.—Flowers: May-June.

Dr.ccan: Maliableshwar, Woodrow,

The bulbs of this plant were sent to Kew by Mr. G. M. Woodrow, who obtained them from Mahableshwar, supposing them to be the bulbs of *Crinum brachynema*. The bulbs flowered at Kew and the plant proved to be a new species. The above description is that of Mr. Baker made from the Kew-grown specimens.

5. Crinum latifolium, Lim. Sp. Pl. (1753) p. 291. Bulb large, subglobose, 5-6 in. in diam.; neck short, stout. Leaves numerous, 2-3 ft. by 3-5 in., lorate, acuminate, bright-green, the margins slightly scabrous. Scape inserted on the neck of the bulb, about as long as the leaves, stout, tinged with purple. Flowers fragrant, white, streaked or tinged with purple down the middle, in 10-20-flowered umbels; pedicels very short; bracts 3-4 in. long, oblong-lanceolate. Perianth-tube

3-6 in. long, curved, cylindric; lobes 3-4 by 1 in., oblong-lanceolate, acute, much longer than the stamens. Stamens declinate, much shorter than the perianth-lobes; filaments $2\frac{1}{2}-3$ in. long; anthers $\frac{1}{2}-\frac{3}{4}$ in. long, grey. Style longer than the stamens. Ovary with 5-6 superposed ovules in each cell. Fruit subglobose, 1½-2 in. in diam. Fl. B. I. v. 6, p. 283; Grah. Cat. p. 216; Wight, Icon. tt. 2019-20; Trim. Fl. Ceyl. v. 4, p. 271; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522; Prain, Beng. Pl. p. 1060; Baker, Handb. Amaryllid. (1888) p. 87. Crinum zeylanicum, Linn. Syst. ed. 12 (1767) p. 236; Watt, Dict. Econ. Prodr. v. 2, p. 591. C. ornatum, Herbert, Amaryllid. (1837) p. 262; Bot. Mag. t. 1171. C. ornatum var. latifolium and Herbertianum, Herbert, Amaryllid, p. 263.—Flowers: May-June.

Konkan: Ritchie!; N. & S. Konkan, rare, Nimmo ex Graham. Deccan: Lanoli, Woodrow; Panchgani, Woodrow. Kanara: banks of the Kala naddi, Ritchie!— DISTRIB. Throughout India, Birma, and Ceylon, wild or cultivated.

VAR. zeylanica, Herbert, Amaryllid. (1837) p. 262. Bulb 6-8 in. in diam.; leaves fewer, narrower, $1\frac{1}{2}-2$ in. wide, shorter, with smooth undulate margins; flowers pinkish; anthers brown. Prain, Beng. Pl. p. 1061. C. zeylanicum (sp.), Linn. Syst. ed. 12, v. 2 (1767) p. 236; Grah. Cat. p. 216.—Flowers: July.

Wild in both Konkans, Graham.

6. Crinum brachynema, Herbert, in Bot. Reg. (1842) Misc. p. 36. Bulb ovoid, $2\frac{1}{2}$ -3 in in diam, without a distinct neck. Leaves not developed till after the flowers, $1\frac{1}{2}$ -2 ft. by 3-4 in., lorate, bright-green, moderately firm, with entire margins. Scape about 1 ft. high, subterete. Flowers pedicellate, 15-20 in an umbel, fragrant; bracts lanceolate, $1\frac{1}{2}-2$ in. long, greenish. Perianth-tube not much curved, greenish, $1\frac{1}{2}$ -2 in. long; lobes 2 by $\frac{3}{4}$ in., pure white, oblanceolate, obtuse, cuspidate. Filaments $\frac{1}{4}$ in. long; anthers $\frac{1}{4}-\frac{1}{3}$ in. long, oblong, yellow. Style shorter than the filaments, included in the tube. Easily distinguished by the short stamens and style. Fl. B. I. v. 6, p. 284; Baker, Handb. Amaryllid. (1888) p. 88; Bot. Mag. t. 5937; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522.—Flowers: May.

Stocks without locality in Herb. Kew.! Deccan: Mahableshwar, Cooke!, Woodrow,

Lady Reay.

Very common in the open jungle on the Mahableshwar Hills, where the naked scapes appear in May as soon as the mists come on the hills before the rains. It is very abundant on the hills, and the bulbs with their flowers are hawked about for sale by the hill coolies. The plant has been grown at Kew from a bulb sent to England by Lady Reay (wife of a former Governor of Bombay) in December 1888. It is worthy of a place in conservatories, and the supply of bulbs from Mahableshwar would be practically inexhaustible.

The above is Dalzell & Gibson's description, from which I fail to identify the plant. There are no specimens in Dalzell's Herbarium in Herb. Kew.

CRINUM AUGUSTUM, Dalz. & Gibs. Bo. Fl. (1861) p. 275. Bulb columnar, mostly above ground. Leaves lanceolate, channelled, linearly tapering, 3-5 ft. long and 3-4 in. broad; scapes lateral, from the axils of the outermost leaves and nearly as long; umbels composed of 30-40 pedicellate flowers, white or rosy, fragrant; tube of corolla 23-5 in. long. On the banks of the Gatpraba and Malpurba rivers.

Crinum augustum, Roxb. Hort. Beng. p. 23, is a native of Mauritius and the Seychelles, and C. canaliculatum, which Dalzell & Gibson cite as a synonym, is C. pedunculatum, Br., a native of Eastern Australia.

4. PANCRATIUM, Linn.

Herbs with tunicate bulbs. Leaves linear or lanceolate, often bifarious. Flowers large, umbellate or solitary, sessile or pedicellate, within 1 or 2 membranous spathes; bracteoles few, linear, hyaline. Perianth funnel-shaped; tube usually long, widened at the mouth; lobes 6, narrow, suberect, subequal. Stamens 6, shorter than the perianth, adnate to its throat; filaments filiform, but connate below in a petaloid membranous cup, the edge of which between the free filaments may be toothed or lobed; anthers oblong or shortly linear, dorsifixed. Ovary 3-celled; ovules many, 2-seriate in each cell; style long, filiform; stigma small, capitate. Fruit a large subglobosely 3-angled loculicidally 3-valved capsule. Seeds many, angular; testa-thick, lax, black.—Distrim. S. Europe, India, Africa; species about 12.

1. Pancratium triflorum, Roxb. Fl. Ind. v. 2 (1832) p. 126. Bulb globose, $1\frac{1}{2}$ -2 in. in diam.; neck 0. Leaves thin, contemporary with the flowers, lanceolate, 8-18 by $\frac{1}{2}$ -1 in., linear-lanceolate, acute. Scape slender, 6-9 in. long. Flowers fragrant, 3-8 in an umbel; spathe single, ovate, acute; pedicels very short. Perianth-tube $1\frac{1}{2}$ -2 in. long, the throat dilated to $\frac{1}{2}$ in. in diam.; lobes linear, $\frac{3}{4}$ -1 in. long. Staminal-cup $\frac{1}{4}$ in. long with bifid teeth between the short filaments; anthers $\frac{1}{6}$ in. long. Style reaching to the top of the perianth-lobes. Fl. B. I. v. 6, p. 285; Baker, Handb. Amaryllid. p. 118; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522. Pancratium malabathricum, Herbert, Amaryllid. (1837) p. 202.—Flowers: May-June.

Deccan: Mahableshwar, Woodrow; Poona, Woodrow; Shinyagad, Symonds!, Woodrow! S. M. Country: Belgaum, Ritchic, 1449!—Distrib, India (Bengal, W. Peninsula).

2. Pancratium parvum, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 144. Bulb globose; neck long, cylindric. Leaves thin, contemporary with the flowers, 6-9 by \(\frac{1}{4} - \frac{3}{4} \) in., linear or linear-lanceolate, attenuated towards the base. Scape very slender, compressed, striate, 6-12 in. long. Flowers white, 2-4 in an umbel; pedicels \(\frac{1}{2} - \frac{1}{4} \) in. long; spathe single, sometimes deeply bifid. Perianth-tube 3-5 in. long, dilated above; lobes 1 in. long, linear. Staminal-cup funnel-shaped, half as long as the perianth-lobes, 12-toothed; filaments hardly longer than the teeth of the cup, and much shorter than the linear anthers. Ovary many-ovulate; style overtopping the anthers. Capsules ovoid, 3-lobed. Seeds few. Fl. B. I. v. 6, p. 286; Dalz. & Gibs. p. 276; Baker, Handb. Amaryllid. p. 119; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522.—Flowers: June-July.

The following plants not belonging to any of the above-named genera are grown as ornamental or useful plants:—

Polianthes tuberosa, Linn. Sp. Pl. (1753) p. 316. The Tuberose, much cultivated in gardens in the Presidency and more or less throughout India; a native of Mexico, growing 3-4 ft. high. Leaves radical or on the lower part of the stem. Flowers white, very fragrant, in long terminal simple racemes; perianth funnel-shaped. Grah. Cat. p. 217; Dalz. & Gibs. Suppl. p. 90; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Watt, Dict. Econ. Prodr. v. 6, part 1, p. 312.—Vern. Gulchabu.

A number of important fibre-yielding plants belonging to the genera Agave and Furcraa have been introduced into India, some of which have become naturalized.

The following synopsis of the plants belonging to these genera which are cultivated or naturalized in the Bombay Presidency has been prepared from the paper entitled "Notes on Agave and Furcrea in India," by Drummond and Prain, of which the authors have been good enough to let me see a copy in advance. The following Key has been prepared for me by Mr. Drummond:—

stantens in bud innexed under the dps of the pertantil-segments;	
after astivation resilient and much longer than the perianth-	
segments	1. AGAVE.
Stamens about equalling the perianth-segments	2. Furchea.

1. AGAPE, Linn.

SECT. I. Euagave. Inflorescence candelabriform.

Perianth-segments narrowed from about the middle to a ligulate	
tipPerianth-segments not constricted towards the tip.	1. A. sisalana
Perianth-segments not constricted towards the tip.	
Leaves in a close globose rosette	2. A. Wightii.
Leaves in a lax rosette or tufted.	-
Leaves narrow, linear-oblong	3. A. Cantala.
Leaves distinctly broader at or above the middle.	
Neck of leaf sharply constricted	
Neck of leaf hardly constricted	5. A. Vera-Cruz.

- 1. Agave sisalana, Perrine, ex Engelmann, in Trans. Acad. Sc. St. Louis, v. 3 (1873) pp. 316-318; Drummond & Prain, in Agricultural Ledger, No. 7 (1906) p. 89. Native country unknown; imported from Central America and the West Indies to India between 1885 and 1892, and grown on a small scale in the Bombay Presidency for its fibre. Mr. Woodrow endeavoured to raise a Company to grow the plant on a large scale in Bombay, but his efforts were unsuccessful. The species varies in India as regards the presence or absence of spines on the leafmargins. Agave rigida var. sisalana, Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522.—Flowers: Jan.-Mar.
- 2. Agave Wightii, Drummond & Prain, in Agricultural Ledger, No. 7 (1906) p. 91. Believed to be a native of St. Vincent (W. Indies), widely naturalized and planted for hedges in S. India, where it was probably introduced in the 17th century by the Portuguese or Dutch. Agave vivipara, Wight, Icon. t. 2024; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522 (short-leaved form). Agave Cantula, Dalz. & Gibs. Bo. Vol. 11.

Fl. Suppl. p. 93 (not of Roxb.).—Flowers: Jan.-June. Vern. Chota-754

Konkan: Bombay, Burkhill. Deccan: Sattara-road Station (S. M. Railway), Burk-Guial.

A variegated form named A. Cookei by Woodrow (Journ. Bomb. Nat. . v. 12 (1899) p. 522) is very closely allied to A. Wightii, and has been hill. treated as a variety of that plant, though probably a distinct species. Woodrow (MS.) describes it as having much white on the margins of the leaves, of slight growth, and very desirable as an ornamental plant in

3. Agave Cantala, Roxb. Hort. Beng. (1814) p. 25; Drummond & Prain, in Agricultural Ledger, No. 7 (1906) p. 87. Native country gardens. unknown; naturalized in different parts of India, probably introduced from Central America via the Philippines in the 17th century. Agave Cantula, Roxb. Fl. Ind. v. 2 (1832) p. 167; Grah. Cat. p. 222 (not of Dalz. & Gibs.). A. vivipara, Dalz. & Gibs. Bo. Fl. (1861) Suppl. p. 93 (not of Wight); Woodr, in Journ. Bomb. Nat. v. 12 (1899) p. 522. Flowers: Jan.-June. VERN. Guial.

Kongan: Bassein, Salsette, Coorla (near Bombay), Burkhill. Deccan: Poong, Saltara, Kolhapur, Burkhill. S. M. Country: Belgaum, Burkhill.

- 4. Agave americana, Linn., var. variegata, Hook. in Bot. Mag. (1839) t. 3654. Native country unknown; commonly grown as an ornamental plant in parks and large gardens; nowhere naturalized in India. Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522.—Vern. Latia-Guial.
 - 5. Agave Vera-Cruz, Mill. Gard. Dict. ed. 8 (1768) n. 7; Drummond & Prain, in Agricultural Ledger, No. 7 (1906) p. 86. Native country unknown, but most probably Mexico; commonly naturalized and planted as a hedge in S. India and parts of the Deccan; used as a hedge-plant along the S. Maratha Railway line. Agave Cantula, Prain, Beng. Pl. p. 1057 (not of Roxb.).

SECT. II. Littæa. Inflorescence spicate.

Species belonging to this section may be met with, but in India have been so far grown as ornamental plants exclusively.

2. FURCRÆA, Vent.

Only one Furcraa has shown any tendency to become naturalized in W. India, which has been usually identified with Furcrata gigantea, Vent., but its identity with that species has not as yet been satisfactorily determined by Drummond and Prain, for want of specimens of the inflorescence. It is known as Mauritius Hemp or (fide Woodrow) Natal Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522.

Planted along the Railway line in the Deccan, Burkhill.

ORDER CXXX. TACCACEÆ.

Perennial herbs; rootstock tuberous or creeping. Leaves radical, large, undivided and costate, or pinnately lobed and reticulately veined; netiole long. Flowers hermaphrodite, regular, densely umbellate on the top of a long naked scape; outer bracts 2-6 (usually 4), leafy and broad, forming an involucre, sometimes colored; inner bracts (bracteoles) under the pedicels many, long, filiform, pendent. Perianth usually lurid, superior, urceolate or subcampanulate, biseriately 6-lobed. Stamens 6, adnate to the perianth-tube or to the base of the perianth-lobes, included; filaments very short, dilated or laterally appendaged at the base, cucullate above the anthers, with 2 ribs or horns on the inner face; anthers 2-celled, sessile within the hood. Ovary inferior, 3-angular, 1-celled; ovules many, on 3 parietal placentas, anatropous or almost amphitropous; style short, included; stigmas 3, often petaloid, broad, 2-fid, and inflexed like an umbrella over the style. Fruit globose, ovoid, turbinate or oblong, 3-6-ribbed, forming an indehiscent berry or rarely a 3-valved capsule. Seeds numerous, ovoid, compressed, longitudinally striate; albumen hard; embryo minute.—Distrib. Species about 10, tropical.

1. TACCA, Forst.

Characters of the Order; fruit always indehiscent.

1. Tacca pinnatifida, Forst. Char. Gen. (1778) p. 70, t. 35. Rootstock globose, 6-10 in. in diam.; rootlets superficial. Leaves 1-3 ft. in diam., circular in outline, 3-partite, the segments variously pinnatifid, margins undulate; petioles 1-3 ft. long, terete, striate, hollow. Scape longer than the petiole, tapering upwards, terete, with pale and dark green stripes, 10-40-flowered. Flowers pedicellate, drooping, about \(\frac{2}{3} \) in. across, green tinged with purple; involucral bracts 6-12, oblong-lanceolate, acuminate, recurved, striped with purple; bracteoles filiform, numerous, very much longer than the bracts. Perianth subglobose, greenish; lobes margined with purple, connivent. Fruit of the size of a pigeon's egg, yellow, 6-ribbed. Seeds angular. Fl. B. I. v. 6, p. 287; Grah. Cat. p. 230; Dalz. & Gibs. p. 276; Trim. Fl. Ceyl. v. 4, p. 274; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522; Watt, Dict. Econ. Prod. v. 6, part 3, p. 402.— Flowers: Sept. Venn. Deva-kanda.

Dalzell without locality in Herb. Kew. Konkan: Nimmo ex Graham, common in the rains, Dalzell & Gibson; Worli and Parel Hills (Bombay), Graham; Kalyan, Woodrow.—Distrais. India (Bengal, Central India, W. Peninsula); Ceylon, Malaya, Pacific Islands, Australia.

Tacca lavis, Roxb., which is given in the 'Flora of B. India' as occurring in the S. Konkan, on the authority of Nimmo, ex Grah. Cat. p. 230, has not, in my opinion, any claim to be considered an indigenous plant. Dalzell does not mention it in his 'Bombay Flora,' which was written on Graham's Catalogue as a ground-work. Woodrow merely quotes Graham, and no Bombay botanists seem to have found the plant in that Presidency.

ORDER CXXXI. DIOSCOREACEÆ.

Large, usually climbing herbs with generally a thick fleshy tuberous underground rootstock (rarely a cluster of tuberous roots). Leaves alternate or opposite, simple or compound, costate and reticulate; petioles often angular and twisted at the base. Flowers small, usually 1-sexual, spicate or racemose, diocious or monocious in separate spikes,

regular; bracts small, often minute, sometimes obsolete; male spikes or racemes simple or paniculate; female simple, sometimes reduced to 1-2 flowers; perianth superior, 6-lobed, in 2 series. Mald flowers: Perianth campanulate or rotate, deeply 6-fid, or urceolate with narrow mouth and short spreading lobes. Stamens 6, adnate to the base of the perianth, all perfect or 3 reduced to staminodes, or only 3 and no staminodes; filaments incurved or recurved; anthers small, 2-celled. globose, oblong or didymous, or the cells discrete on branches of the filament. Pistillode various or 0. Female Plowers: Perianth usually smaller than in the male, 6-fid or 6-partite, persistent. Staminodes 3 or 6 or 0. Ovary inferior, 3-quetrous, 3-celled; ovules 2 in each cell. superposed, pendulous, anatropous or subamphitropous; styles 3, very short; stigmas entire or 2-fid, recurved. Fruit a berry or 3-valved capsule. Seeds flat or globose; albumen fleshy, rather hard; embryo. minute, enclosed in the albumen.—Distrib. Genera 8; species about 160, tropical and subtropical.

1. DIOSCOREA, Linn.

Herbs with slender twining (rarely procumbent) stems. Leaves alternate or sometimes opposite, entire or lobed, or digitately 3-9-foliolate. Flowers 1-sexual, usually diocious. Male flowers: Perianth campanulate, rotate, or urceolate; lobes short, sprending. Stamens 6 perfect, or 3 alternating with 3 staminodes, or 3 without staminodes; anthers small, the cells contiguous or discrete. Pistillode thick, fleshy or 0. Female flowers: Perianth-segments 6, free, small. Staminodes 6 or 3 or 0. Ovary inferior, 3-quetrous, 3-celled; ovules 2 in each cell, superposed, laterally attached near the apex; styles 3, short; stigmas terminal, entire or 2-fid, reflexed above the style. Fruit a loculicidal capsule, laterally flattened, almost winged. Seeds compressed, often with a large membranous wing; albumen compressed, fleshy or hard, 2-laminate; embryo between the laminæ with a sub-orbicular cotyledon.—Distrib. Tropical and subtropical; species 150.

thicain or justices manage management	., crosses more
Leaves 3-5-foliolate.	
Stamens 6, all antheriferous; leaflets 3	 D. damona.
Stamens 3 antheriferous, alternating with 3 staminodes; leaflets usually 5, sometimes 3, rarely 7	2. D. ventanhulla.
Leaves simple.	, , ,
Capsules longer than broad; seeds winged at the base only;	· · ·
	3. D. bulbifera.
Capsules suborbicular, often broader than long; seeds winged all round; leaves usually opposite	4. D. oppositifolia

1. Dioscorea dæmona, Roxb. Fl. Ind. v. 3 (1832) p. 805. Root tuberous, lobed, biennial; stems twining, more or less prickly. Leaves 3-foliolate; common petiole 4-8 in. long, usually prickly; leaflets 4-8 by 2-5 in., all petiolulate, broadly cuneate-obovate, cuspidately caudate-acuminate, villous when young, glabrous in age, sometimes reticulately veined, base tapering, 3-5-nerved; lateral leaflets very oblique; petiolules $\frac{1}{3} - \frac{5}{3}$ in. long. Male rlowers in dense cylindric pedanculate spikes $\frac{1}{4} - \frac{1}{3}$ in. long, arranged in clusters along the more or less prickly, pubescent or villous rhachis of a raceme 6-18 in. long; pedancles of spikes $\frac{1}{20} - \frac{1}{4}$ in. long, pubescent; bracts broadly ovate, deltoid at the apex, pubescent, shorter than the flowers. Perianth

nearly $\frac{1}{5}$ in. across; lobes broadly oblong or suborbicular, usually rounded, the 3 outer membranous, shorter than the inner, the 3 inner coriaceous or somewhat fleshy, with incurved tips, longer than the outer. Stamens 6, all antheriferous; anthers subsessile. Pistillode very low, broad. Finally flowers: Spikes solitary, distant. Capsules 2 by 1 in., quadrately oblong, truncately rounded at the ends, smooth and polished; pedicels very short. Seeds $1\frac{1}{4}$ in. long (including the wing); wing $\frac{7}{6}$ by $\frac{1}{2}$ in., at the base of the seed, membranous, oblong, obtuse, broader than the flat oblique nucleus. Fl. B. I. v. 6, p. 289; Wight, Icon. t. 811; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522; Prain, Beng. Pl. p. 1064; Watt, Dict. Econ. Prod. v. 3, p. 129. Helmia dæmona, Kunth, Enum. v. 5 (1850) p. 439; Dalz. & Gibs. p. 247.—Flowers: Oct.

Not common in the Bombay Presidency. Konkan: Law!; hills in the Konkan rare, Dalzell & Gibson; Vingorla, Dalzell & Gibson. S. M. Country: Castlerock, Woodrow. Kanara: below the fall on the Kala naddi, Ritchie, 1448!—Distrib. Throughout India; Malaya, Tonkin.

2. Dioscorea pentaphylla, Linn. Sp. Pl. (1753) p. 1032. tubers oblong, very long (5-6 ft. according to Thwaites); stem slender, twining, glabrous, prickly towards the base, often bulbiferous in the leafaxils. Leaves alternate, 3-5 (rarely 7) -foliolate, glabrous or sparsely pubescent beneath; common petiole 1-2½ in. long; leaflets variable in size and shape, 2-5 by 1-2 in., elliptic-lanceolate, ovate or obovate, acuminate, cuspidate or subcaudate, base usually acute; lateral leaflets oblique at the base; petiolules very short. MALE FLOWERS palegreenish, fragrant, in very slender shortly pedunculate racemes $1-1\frac{1}{2}$ in. long, which are solitary or in fascicles along the hairy branches of a panicle 6-12 in. long; bracts $\frac{1}{10}$ in. long and as broad as long, membranous, often mottled with brown, broadly ovate or almost semicircular, with a long slender acumen, glabrous. Perianth nearly $\frac{1}{5}$ in. across when spread out; segments often mottled with brown, ovate, subacute, sparsely pubescent, subequal; pedicels very short. Stamens 3 perfect; anthers subsessile; staminodes 3, minute. Pistillode 3-lobed. Female FLOWERS in axillary pendulous pubescent spikes 2-6 in. long. Capsules quadrately oblong, $\frac{3}{4}$ -1 in. long, usually retuse at both ends, nearly glabrous or more or less pubescent, often apiculate. Seeds $\frac{1}{2}$ - $\frac{3}{4}$ in. long (including the wing at the base); wing longer and broader than the oblique nucleus, thinly membranous. Fl. B. I. v. 6, p. 289; Grah. Cat. p. 218; Dalz. & Gibs. p. 247; Wight, Icon. t. 814; Trim. Fl. Ceyl. v. 4, p. 276; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522; Prain, Beng. Pl. p. 1065; Watt, Dict. Econ. Prod. v. 3, p. 132. Dioscorea triphylla, Linn. Sp. Pl. (1753) p. 1032; Grah. Cat. p. 218; Dalz. & Gibs. p. 247. D. Jacquemontii, Ilook. f. Fl. B. I. v. 6 (1892) p. 290 .-Flowers: Sept.-Oct. VERN. Shendvel.

Konkan: Dalzell & Gibson; Konkan and Gháts, Graham. - Deccan: Khandala, Cooke!; Sinhagad, Woodrow; Mahableshwar, Cooke!, H. M. Birdwood; between Poona and Karli, Jacquemont! S. M. Country: Belgaum, Ritchie, 730!—DISTRIB. Throughout India; Ceylon, Malay hills, Tropical Africa. The tubers of the wild plant are dug up and caten throughout India. The fragrant male flowers are sold in the native bazaars and eaten as greens (Dalzell & Gibson).

I cannot separate Dioscorea Jacquemontii, Hook. f., from D. pentaphylla, which is itself a rather variable plant. I have found mottled bracts and mottled perianthlobes, as well as flowers nearly & in. across when spread ont, in many specimens of D. pentaphylla from several localities in the Presidency. The difference in the size of

the flowers, varying perhaps γ_5 in. or so, may, I think, depend not only on the age of the plant, but also (as is the case with the leaves) on the part of the plant from which they have been gathered. In Herb, Kew, I have found that a specimen collected by Ritchir in Belgaum (No. 730) has been named D. Jacquemontii, while a similar specimen, collected in the same locality and bearing the same number, has been consigned to the pentaphylla bundle.

3. Dioscorea bulbifera, Linn. Sp. Pl. (1753) p. 1033. Tubers large, globose or elongate; stem terete, unarmed, glabrous, bulbiferous in the leaf-axils, the bulbils warted. Leaves opposite and alternate. variable in size, 3-14 in. long and broad, membranous, dark-green, broadly ovate, acuminate, cuspidate or caudate, base cordate with a broad, deep, or shallow sinus; nerves 7-9 (rarely 11). Male flowers variable in size, green or purplish, in short slender (almost capillary) spikes 1-4 in. long, close together or scattered on the branches of crowded axillary slender pendulous glabrous spikes or panicles reaching 12 in. long; bracts ovate, acuminate. Perianth sessile by a broad base; segments subvalvate, fleshy, the outer $\frac{1}{10}$ in. long, lanceolate, the inner smaller and narrower. Stamens 6; filaments short; anthers minute, didymous; pistillode 3-lobed. FEMALE FLOWERS sessile, in. long, in axillary solitary or fascicled pendulous spikes 4-10 in. long. Perianth as in the male. Staminodes 6. Bracts below the ovary minute, ovate, Style short, conical; stigmas 3, very short, recurred. Capsules $\frac{2}{3}-1$ in. by $\frac{1}{3}-\frac{1}{2}$ in., quadrately oblong, rather broader upwards, with a truncate or subcordate base. Seeds winged at the lower endonly, the wing twice as long as the nucleus. Grah. Cat. p. 219; Trim. Fl. Ceyl. v. 4, p. 279 in adnot.: Wight, Icon. t. 878; Wait, Dict. Econ. Prod. v. 3, p. 128. Dioscorea bulbifera var. pulchella, Prain, Beng. Pl. p. 1065. D. pulchella (sp.), Roxb. Fl. Ind. v. 3 (1832) p. 801. Helmia bulbifera, Kunth, Enum. v. 5 (1850) p. 435; Dalz. & Gibs. p. 247 .-Flowers: Aug.-Oct. VERN. Kadu-karanda.

Stocks without locality in Herb. Kew.! Konkan: Groham, Dalzell & Gibson; Dapoli, Nairne S. M. Countan: Belgaum, Ritchie, 728!; Londa, Cooke!—Distrib. Throughout India; Ceylon.

Van. sativa, Prain, Beng. Pl. p. 1065. Stem with axillary bulbils, smooth, not warted. Dioscorea sativa (sp.), Hook. f. Fl. B. I. v. 6 (1892) p. 295; Grah. Cat. p. 218; Dalz. & Gibs. Suppl. p. 92; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523; Watt, Diet. Econ. Prod. v. 3, p. 133.—Vern. Gorkan.

Occasionally cultivated.

4. Dioscorea oppositifolia, Linn. Sp. Pl. (1753) p. 1033. A large climber; rootstock short, with many long cylindric roots as thick as a swan's quill; stem slender, unarmed; branches terete, not bultiferous, glabrous or pubescent. Leaves coriaceous, opposite or subopposite (rarely alternate), simple, 2-5 by 1-3 in., polymorphous, from lanceolate to elliptic-oblong, ovate or suborbicular, acuminate or rounded, with well-defined cartilaginous margins, usually glabrous, base rounded, with 3-5 strong nerves; petioles \(\frac{1}{2}\)-\(\frac{1}{4}\) in. long. Make rlowers in dense shortly pedunculate spikes \(\frac{3}{2}\)-\(\frac{1}{4}\) in. long which are fascicled in the leaf-axils or along a slender axillary rhachis 4-10 in. long; bracts below the spikes \(\frac{1}{4}\) in. long, lanceolate-subulate; bracts below the flowers \(\frac{1}{2}\) in long, 'ovate, acuminate, membranous, mottled with brown. Perianth

sessile with a broad base; outer lobes $\frac{1}{12}$ by $\frac{1}{16}$ in., broadly ovate or suborbicular, concave, obtuse, mottled with brown; inner lobes smaller, somewhat ovate, mottled with brown. Stamens 6, perfect; anthers didymous; pistillode obscure. Female rlowers distant, in solitary or fasciculate axillary spikes 6-8 in.long; bracts $\frac{1}{20}$ in.long, suborbicular, acuminate, and as well as the perianth-lobes mottled with brown. Capsules suborbicular or often broader than long, $1-1\frac{1}{2}$ in. in diam., truncate, retuse or almost 2-lobed at the apex, coriaceous, glabrous, base cuneate. Seeds orbicular, $\frac{3}{4}-1$ in. in diam. with a large membranous wing all round the nucleus. Il. B. I. v. 6, p. 292; Grah. Cat. p. 219; Dalz. & Gibs. p. 247; Wight, Icon. t. 813; Trim. Fl. Ceyl. v. 4, p. 276; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523; Watt, Dict. Econ. Prod. v. 3, p. 132.—Flowers: Sept.—Oct. Venn. Paspoli.

Stocks without locality in Herb. Kew.! Konkan: Stocks! Decean: near Poona, Woodrow, 361; Bowdhan, 8 miles W. of Poona, Kanitkar!; Khandala, Cooke!; near Shivapur, Kanitkar! Kanara: Stocks!—Distrib. East and west coasts of S. India, Assam; Ceylon.

Dioscorea fasciculata, Roxb. Fl. Ind. v. 3 (1832) p. 801. Var. spinosa, Prain, Beng. Pl. p. 1065. Tubers few, unequal, mixed with many fibrous roots, of which the uppermost are spinous. Leaves pubescent, reniform or orbicular, cordate at the base, with sharp stipule-like spines. Capsules broader than long, broadly obcordate. Dioscorea spinosa (sp.), Roxb. ex Wall. Cat. (1828) 5103; Hook. f. in Fl. B. I. v. 6 (1892) p. 291; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 522. D. aculeata, Roxb. Fl. Ind. v. 3 (1832) p. 800; Grah. Cat. p. 218; Dalz. & Gibs. Suppl. p. 92; Watt, Diet. Econ. Prod. v. 3, p. 125.

Sparingly cultivated in gardens. The tubers are largely imported into Bombay and known as the Goa Potato (Graham, Dalzell &

Gibson).

Dioscorea alata, Linn. Sp. Pl. (1753) p. 1033. Var. globosa, Prain, Beng. Pl. p. 1065. Quite glabrous; tubers roundish or oblong, white inside; stem acutely angled or winged. Leaves mostly opposite, 3-7 by 1½-5 in., broadly ovate, cuspidately acuminate, subhastately or deeply cordate and 7-9-nerved at the base; petioles 2-5 in. long. Capsules 1 by 1½ in., broader than long, of 2 semicircular flat lobes, retuse at the apex, cuneate at the base. Seeds with a wing all round. Cultivated commonly. Dioscorea alata (sp.), Grah. Cat. p. 218; Hook. f. Fl. B. I. v. 6, p. 296; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523 (all in part). Dioscorea globosa (sp.), Roxb. Fl. Ind. v. 3 (1832) p. 797; Dalz. & Gibs. Suppl. p. 92; Watt, Dict. Econ. Prod. v. 3, p. 131. Graham says that the plant is wild in the Konkan, but this is not the case. The plant has not apparently been found wild in India and is only known in cultivation. The tubers are much esteemed as a vegetable by Europeans and natives.—Flowers: Aug. Vern. Goradu.

EXCLUDED SPECIES.

DIOSCOREA GLABRA, Roxb. Fl. Ind. v. 3 (1832) p. 804. This species does not appear to occur in the Bombay Presidency, though the Konkan is assigned as its habitat in the 'Flora of British India.' There are no specimens from the Konkan in Herb. Kew. Woodrow in his list merely copies the Flora of B. I., but neither he nor any other botanist has discovered the plant in Bombay.

ORDER CXXXII. LILIACEÆ.

Herbs (very rarely shrubs or small trees) with fibrous roots, or a creeping rootstock, or a bulb or corm. Leaves various. Flowers usually hermaphrodite, axillary or terminal, solitary, or twin, or umbellate, spicate, racemose, paniculate, or fasciculate; bracts usually small, scarious, sometimes, when the flowers are umbellate, spathe-like. Perianth herbaceous or petaloid, usually 6-merous in 2 series, imbricate (rarely valvate) in bud. Stamens 6 (rarely 3 or fewer), hypogynous or adnate to the perianth; filaments free or connate: anthers oblong or linear, often dorsifixed, usually dehiscing longitudinally. Ovary 3-celled; ovules 2 or more from the inner angles of the cells, anatropous (rarely orthotropous); style usually simple, often long (rarely short or 0), or styles 3. Fruit a capsule or berry, usually 3 (rarely 1) -celled. Seeds 1 or more, globose or flattened; albumen horny or fleshy; embryo small, terete.—Distrib. Genera 187; species about 2500, in all climates and countries.

Shrubs with perennial stems above ground, fruit berry-like. Stems climbing or struggling, leaves replaced by linear or acceular cladedes	1. Asparagus.
Stems leafy. Leaves 3~5-nerved and reticulately veined, arranged at mterrals along a usually climbing stem Leaves closely and numerously parallel-nerved, generally	2. Shilat.
there at the apox of a usually erect cauder Herbs with annual stems or scapes rising usually from underground perennial rootstocks, corms, or balbs, rarely (Asphodelus)	3. Dracana.
the plant wholly annual. Underground perennial stems large in proportion to the roots. Perennial stem a creeping rootstock, annual nerial stemeret, leafy, leaves broad; fruit a berry	4. Distorum.
Perennial stem compact, not creeping, fruita loculicidal capsule. Acrial annual stem climbing, lenfy; leaves broad,	a, anatomon.
with tendril-like tips; perianth large, showy; rootstock tuber-like, irregular, naked	5. Glorios 1.
rootstock a globose coated corm or bulb. Perennal stem a solid corm covered with brown sheaths; annual stem leafy; flowers solitary or corymbose	6. Iphigenia.
Perennal stem a tumented bulb; annual scape simple, naked, leaves radical; flowers racemose.	
Seeds subglobose, periunth G-purtute; segments stellate	7. Soilla.
Perianth campanulate, 6-partite Perianth cylindric, 6-lobed; outer lobes recurved from the middle,	8. Urginla.
the inner from the tips only Underground perennial stem small or (Asphodelus sometimes) none, root-fibres large, numerous, usually some or all fleshy or tuberous; leaves radical, capsule loculoidal.	9. Dipcadi.
Each cell of the ovary 2-ovulate; capsule 3-quetrous; leaves semiterete; plant often wholly annual Each cell of the ovary 4- or more-ovulate, capsule	
deeply 3-winged, leaves flat	11. UHLOROPHATUM.

1. ASPARAGUS, Linn.

Undershrubs; stems erect, straggling or climbing, tekete, grooved or angled; rootstock stout, creeping. Leaves minute, scale-like, bearing in their axils tufts of needle-like or flattened cladodes. Flowers hermaphrodite (in the Bombay species), small or minute, axillary, solitary, fasciculate or racemose, pendulous; pedicels jointed; bracts minute or obsolete. Perianth petaloid, 6-partite, campanulate or funnel-shaped. Stamens 6, adnate to the base of the perianth-segments; filaments free; anthers oblong. Ovary 3-celled; ovules 2 or more in each cell; style columnar; stigmas 3, recurved. Fruit a globose pulpy berry. Seeds few or by abortion solitary, subglobose; testa black, fragile; embryo dorsal; albumen hard.—Distrib. Europe and Temperate and Tropical Asia and Africa; species about 100.

Flowers in axillary clusters, not racemose. An erect straggling undershrub; leaves with small spinous spurs of in. long; cladodes mucronate, in clusters of 3-8, straight or falcate 1. A. dumosus. A subscandent undershrub; leaves with hard conical spinous spurs 1-1 in. long; cladodes 3-gonous, acuminate, in clusters of 3-5 2. A. Jacquemonti. Flowers racemose. Cladodes subulate or 3-quetrous. 3. A. lævissimus. 4. A. racemosus var. javanica. Cladodes flattened, linear, 20-15 in. wide, usually falcate ... A. gonoclados.

1. Asparagus dumosus, Baker, in Journ. Linn. Soc. v. 14 (1874) p. 608. A branched spreading diffuse undershrub, 2 ft, high, the older branches woody, the younger flexuous; branchlets pale, glabrous, conspicuously striate, the striæ often minutely scabrous. Leaves deltoid-ovate, cuspidate, with a spur about $\frac{1}{20}$ in. long at the base, standing out from the branch. Cladodes $\frac{1}{4}-\frac{1}{2}$ in. long, in clusters of 3–8, stout, linear, channelled, mucronate. Flowers axillary, 2–4-nate; pedicels $\frac{1}{10}$ in. long, filiform. Perianth rather more than $\frac{1}{8}$ in. long, funnel-shaped; segments oblanceolate. Stamens $\frac{1}{10}$ in. long; anthers subglobose, $\frac{1}{30}$ in. in diam. Style $\frac{1}{20}$ in. long; stigmas 3, spreading, about $\frac{1}{20}$ in. long. Berry $\frac{1}{6}$ in. in diam. Fl. B. I. v. 6, p. 315; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523.

Sind: Stocks, 441!; Dalzell, 59!; Jemadar ka Landa near Karachi, Stocks, 441! Apparently endemic in Sind.

2. Asparagus Jacquemonti, Baker, in Journ. Linn. Soc. v. 14 (1874) p. 615. A branched subscandent undershrub; stems terete, quite smooth, with angular flexuous spreading or decurved branchlets. Leaves spurred at the base with hard spines $\frac{1}{6}-\frac{1}{4}$ in. long. Cladodes 3-5-nate, spreading, arcuate, 3-quetrous, $\frac{3}{3}-\frac{1}{2}$ in. long. Flowers axillary, solitary or in pairs, sometimes furnished with a short common peduncle; pedicels $\frac{1}{8}-\frac{1}{6}$ in. long, filiform, jointed above the middle. Perianth $\frac{1}{16}-\frac{1}{10}$ in. long; segments oblong-oboyate, obtuse, spreading. Anthers about $\frac{1}{60}$ in. in diam., globose. Style short. Berry not seen. Fl. B. I. v. 6, p. 316; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523.

Decean: between Poona and Karli, Jacquemont, 526!

There is but I sheet in Heib Kew, without fruit. The plant does not appear to have been found by any other collector, which, considering that the locality indicated by Jacquement is on the Rulway line, seems strange—Distairs. India (W. Pennisula)

3. Asparagus lævissimus, Steud. in Hohen. Pl. Nily. Exsice, no. 1304 A subscandent undershrub; main stems terete, polished; branches conspicuously strate; branchlets ascending, angular. Leaves with stout conical deflexed rigid spinous spurs, $\frac{1}{3}-\frac{1}{2}$ in, long at the base. Cladodes 3-6-nate, spreading or ascending, 3-quetrous, $\frac{1}{4}-\frac{3}{8}$ by $\frac{1}{30}$ in. Flowers in dense racemes 1-2 in, long, solitary or twin; pedicely $\frac{1}{10}-\frac{1}{8}$ in, long, filitorin, jointed at or below the middle; bracts below the pedicels $\frac{1}{10}-\frac{1}{8}$ in long, orate, acute, concave. Perianth-segments $\frac{1}{10}-\frac{1}{9}$ by $\frac{1}{30}$ in, linear-oblong, obtuse. Stamens as long as the perianth; anthers $\frac{1}{70}$ in diam., subglobose. Style very short and stout; stigmas 3, spreading. Berry $\frac{1}{4}$ in. in diam. Fl. B. I. v. 6, p. 317; Baker, in Journ. Linn. Soc. v. 14 (1874) p. 623; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523.

Rare Konkan Stocks', Law'; Western Gháts, Woodrow — Distrib. India (W. Pennsula)

4. Asparagus racemosus, Willd. Sp. Pl. v. 2 (1799) p. 152. VAR. javanica, Baker, in Journ. Linn. Soc. v. 14 (1874) p. 624. An extensively scandent spinous much-branched undershrub ; rootstock tuberons ; branches angular. Leaves 1-1 in. long, hnear-subulate, with a stout conical spinous spur, straight or slightly curved, $\frac{1}{n} - \frac{1}{n}$ in, long, at the base. Cladodes very slender, 1-1 in. long, spinous-pointed. Flowers white, fragiant, in simple (rarely branched) racemes 2-6 in, long; rhachis 3 quetrous, with several cladodes along it, increasing in number towards the apex, which is often crowned with a tuft of them; pedicels $\frac{1}{8}$ in. long, filiform, jointed above the middle, usually solitary, but sometimes 2-nate along the rhaches, with a small orate acute bract 1 in. long at Persanth-segments $\frac{1}{10}$ by $\frac{1}{10}$ in., linear-oblong, obtuse. Anthers subglobose, -to in. in diam. Style very short; stigmas spreading. Berry globose, 1 in. in diam., red when ripe. Fl. B. I. v. 6, p. 316; Wight, Icon. t. 2056; Baker, in Journ. Linn. Soc. v. 14 (1874) p. 623; Woodr. m Jouin. Bomb. Nat. v. 12 (1899) p. 523; Prain, Beng. Pl. p. 1070; Watt, Diet. Econ. Prod. v. 1, p. 345. Asparagus sarmentosus, Grah. Cat. p. 221 (not of Linn.). Asparagopsis javanica, Kunth, Enum. (1850) v. 5, p. 100. Asparagopsis sarmentosa, Dale & Gibs. Bo. I'l. (1861) p. 246 (not of Kunth).—Flowers: June-Sept. VLRN. Satavarı.

Common on the Ghats Konkan. Law', Stocks', Graham Dicean. Graham; common on Decean hills, Cooke', Woodrow', Panengani, Cooke', Mahableshwar, Cooke', H. M. Birdvood S M Country Castlerack, Woodrow', Badami, Woodrow' Guinry Daleell & Gibson Kanan; Kula naddi, Ritchie, 737'—Distrib. India (W. Paninsula), Java

The oblong fleshy tubers are often candied for the table

5. Asparagus gonoclados, Baker, in Journ. Linn. Soc. v. 14 (1874) p. 627. A much-branched subscandent armed undershrub; main stems smooth, terete; branches firm, green, 3-quetrous. Leaves spurred at the base with hard spines $\frac{1}{4}$ - $\frac{1}{4}$ in. long. Cladodes 2-6-nate, $\frac{1}{4}$ -1 by $\frac{1}{20}$ - $\frac{1}{16}$ in., flat, usually talcate, ascending, firm, subcostate, narrowed to both ends, finely spinous-pointed. Flowers white, in racemes 1-3 in.

long, sometimes fasciculate or obscurely paniculate; pedicels $\frac{1}{20}$ $\frac{1}{12}$ in. long, jointed about the middle; bracts $\frac{1}{10}$ in. long, ovate, boat-shaped. Perianth $\frac{1}{16}$ $\frac{1}{12}$ in. long; segments spreading, the outer linear-oblong, the inner subspathulate. Anthers minute. Berry globose, $\frac{1}{6}$ in. in diam., or didymous and twice as broad (*Trimen*). Fl. B. I. v. 6, p. 318; Trim. Fl. Ceyl. v. 4, p. 286; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523.—Flowers: Jan.

Rare. Konkan: Law! Kanara: Siddapur (N. Kanara), Woodrow, - Distrib. India (W. Peninsula); Ceylon.

Asparagus officinalis, Linn. Sp. Pl. (1753) p. 313. The Asparagus, often cultivated in the gardens of Europeans in India, but requiring very careful treatment and high manuring to produce shoots of any size. As asparagus plantations in India do not last long, it is advisable to prepare a fresh one yearly.

2. SMILAX, Linn.

Climbing shrubs (rarely erect herbs). Leaves alternate (rarely opposite), persistent, 3-7-nerved, reticulately veined; petiole usually with 2 tendrils above its base. Flowers small, umbellate, diocious. Perianth of 6 free, usually incurved or recurved, subequal segments. Main flowers: Stamens 6 or more, inserted at the base of the perianth; filaments erect, free, long or short; anthers oblong, 2-celled, didymous, with contiguous cells or with cells discrete by a forking of the connective. Pistillode 0. Female flowers: Staminodes 3 or 6, filiform. Ovary 3-celled, 3-gonous; ovules 1-2 in each cell, orthotropous, pendulous; style short or 0; stigmas 3, stout, recurved. Fruit a globose berry. Seeds solitary, or more often 2, hemispheric (rarely 3); albumen horny; embryo small.—Distrib. Species about 180, in temperate and tropical regions.

1. Smilax macrophylla, Roxb. Hort. Beng. (1814) p. 72. A large climber; stems smooth, striate, armed with a few small distant prickles or almost unarmed. Leaves alternate, 3-8 by 1½-4½ in. (much larger in some Kumaon and Rangoon specimens), broadly ovate, or suborbicular. acuminate or cuspidate, glabrous, polished and shining, base usually rounded; main nerves 5-7 (usually 5), with reticulate venation between; petioles 2-1 in. long, stout, narrowly sheathing below the middle; tendrils very long and slender. Flowers in pedunculate many-flowered umbels; peduncles $\frac{1}{2}$ - $\frac{3}{4}$ in. long; bracts below the peduncles ovate, acute, $\frac{1}{10}$ in. long; pedicels of both male and female flowers arising from an aggregation of numerous minute bracts. Male flowers: Pedicels $\frac{1}{5}$ in. long. Perianth $\frac{1}{4}$ - $\frac{1}{3}$ in. long; segments linear, obtuse, erect when young, afterwards reflexed, the 3 outer 10 in. broad, the 3 inner half as broad. Stamens 1 in. long. Female Flowers: Perianth rather shorter than in the male, the segments reflexed, the 3 outer ovate-oblong, obtuse, $\frac{1}{12}$ in. broad, the 3 inner half as broad; pedicels \frac{1}{4} - \frac{1}{3} in. long, slightly elongating in fruit. Stigmas 3, recurved. Berry perfectly spherical, of the size of a large pea, smooth, remaining green for a long time, becoming ultimately red when ripe; fruiting pedicels 5-1 in. long. Fl. B. I. v. 6, p. 310; Grah. Cat. p. 219; Dalz. & Gibs. p. 246; DC. Monog. Phan. v. 1 (1878) p. 193; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523; Prain, Beng. Pl. p. 1071; Watt, Dict. Econ. Prod. v. 6, part 3, p. 255. Smilax ovalifolia, Roxb. Fl. Ind. v. 3 (1832) p. 794; Grah. Cat. p. 219; Dalz. & Gibs. p. 246.—Flowers: Aug. Venn. Ghotvel.

KONKAN: Graham, Dalzell & Gibson. Deccan: Mahableshwar, common, Cooke 1, H. M. Birdwood, Woodrow. S. M. Country: Chorla Ghat, Dalzell & Gibson.— DISTRIB. Throughout India.

3. DRACÆNA, Linn.

Shrubs (sometimes climbing) or small trees. Leaves alternate or crowded and subterminal, sessile or petiolate, many-nerved, costate or not. Flowers in terminal racemes, panicles, heads, or umbels; bracts small. Perianth corolline, tubular, campanulate or funnel-shaped, G-cleft; lobes narrow. Stamens 6, adnate to the base of the perianth-tube; filaments filiform or flattened; anthers versatile. Ovary 3-celled; ovules in each cell solitary, erect; style filiform; stigma capitate. Fruit a globose, didymous or 3-lobed berry. Seeds globose or angled; testa thickened; albumen horny; embryo small.—Distrib. Warm regions of the Old World; species about 35.

1. **Dracæna terniflora**, Roæb. Fl. Ind. v. 2 (1832) p. 159. A slightly branched glabrous straggling shrub, the stems scarcely more than \(\frac{1}{4}\) in. thick, sometimes rooting at the base. Leaves (including the petioles) 8-12 by \(\frac{1}{4}-2\)\frac{1}{2}\) in., somewhat crowded, elliptic-lanceolate, acute or acuminate, thinly coriaceous, narrowed into the petiole; petioles 1-3 in. long, with a widened subamplexicant base. Flowers white, often 2-3 together on the rhachis of a usually simple raceine 4-8 in. long; pedicels \(\frac{1}{6}\) in. long, jointed in the middle; bracts scarious, ovate, acute. Perianth \(\frac{3}{4}-\frac{7}{6}\) in. long, divided to about the middle; lobes linear, obtuse, \(\frac{1}{12}\) in. broad. Anthers \(\frac{1}{6}\) in. long. Style \(\frac{5}{6}\) in. long. Fruit a red globose berry nearly as large as a cherry, smooth, glossy, 1-seeded. Fl. B. I. v. 6, p. 328; Kurz, For. Fl. v. 2, p. 545 (by error ternifolia); Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523; Prain, Beng. Pl. p. 1072. D. spicata, Baker, in Journ. Linn. Soc. v. 14 (1874) p. 532. D. terminalis, Wight, Icon. v. 6 (1853) p. 26, t. 2054. D. Heyneana, Wall. Cat. (1828) 5151.—Flowers: Dec.

Ritchie without locality, 1461, in Herb Kew.! Konkan: Wari country, Dalzell! S. M. Codkien: Castlerock, Cooke! Kanka: Kumpta-Sirsi Road, Woodrow!—Discrib. More or less throughout India, Mulay Peninsula.

Mr. Baker (Journ. Lunn. Soc. 1. c.) unites this with *D. spicata*, Royb., under that specific name. Prain (Beng. Pl. p. 1072) gives characters by which the two specifs may be distinguished. *D. spicata* is a small tree with creet stems, broadly and shortly petiolate leaves, flowers in fascicles, and an orange-red berry, while *D. terniflora* is a straggling shrub with ascending weakly branched stems, narrowly and distinctly petiolate leaves, flowers 2-3-nate, and a cherry-red berry.

The following are often grown in gardens:-

Dracana elliptica, Thunb. Diss. Bot. Dracan. (1808) p. 6. An undershrub, a native of Silhet, the Khasia Hills, Birma, the Andamans, and Java, 2½ ft. high, with torete stems as thick as a goose-quill, leaves green, or blotched with white or black, or all purple, and with groenish-yellow

flowers in pedicellate fascicles of threes. Fl. B. I. v. 6, p. 330; Woodr. Gard. in Ind. ed. 5, p. 506.

There is a pretty variety, maculata (Bot. Mag. t. 4787), with the

leaves spotted or blotched with yellow.

Dracuna concinna, Kunth, Enum. v. 5 (1850) p. 8. A neat-growing species reaching 6 ft. high, with narrow green leaves with purplish-red margins, a native of Mauritius. Woodr. Gard. in. Ind. ed. 5, p. 505.

Dracana Goldieuna, Bull, Cat. (1877) p. 9. A magnificent ornamental foliage plant of erect habit, a native of Tropical Africa. It bears white flowers in a dense globose sessile head 2 in. in diam, and ovate cordate acuminate leaves, marbled and irregularly banded with dark green and silvery grey in alternate straight or furcate bands. Woodr. Gard. in Ind. ed. 5, p. 507; Illust. Hortic. v. 25 (1878) p. 8, t. 300.

4. **DISPORUM**, Salisb.

Herbs with erect angular leafy stems arising from a creeping rootstock. Leaves sessile or subsessile, strongly nerved. Flowers in terminal or axillary few-flowered umbels; pedicels decurved. Perianth narrowly campanulate, deciduous; lobes 6, petaloid, subequal, free, erect or spreading at the tips, their bases saccate or spurred. Stamens 6, hypogynous; anthers dorsifixed, dehiscing extrorsely. Ovary 3-celled; ovules 2-6 in each cell; style long or short; stigmas 3, short. Fruit a fleshy pisiform black berry. Seeds few, subglobose; testa brown; albumen horny; embryo small.—Distrib. Species about 12, Asiatic and N. American.

1. **Disporum Leschenaultianum**, D. Don, in Trans. Linn. Soc. v. 18 (1839) p. 518. Stem 1-2 ft. high, acutely angular, simple below and clothed with broad sheathing scales, dichotomously branched above. Leaves 1-4 by 1-2 in., ovate-oblong, cuspidately acuminate, membranous, green on both sides, with 5-9 strong nerves and many slender intermediate ones, base rounded; petioles $\frac{1}{8}$ in. long. Flowers white, in axillary 3-5-flowered sessile umbels; pedicels $\frac{5}{3}$ - $\frac{7}{6}$ in. long. Perianth $\frac{3}{8}$ - $\frac{5}{8}$ in. long; segments $\frac{1}{6}$ - $\frac{1}{4}$ in. broad, oblong-lanceolate, subacute, obscurely ciliolate on the margins and with a subsaccate base. Filaments stout, about as long as the anthers. Berry $\frac{3}{4}$ in. in diam., depressed-globose, dark-blue when ripe. Seeds globose. Fl. B. I. v. 6, p. 360; Wight, Icon. t. 2048; Baker, in Journ. Linn. Soc. v. 14 (1874) p. 590; Trim. Fl. Ceyl. v. 4, p. 289; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524. Disporum mysorense, Wight, Icon. v. 6 (1853) p. 25, t. 2049. D. ceylanicum, Wight, Icon. v. 6 (1853) p. 26, t. 2049.

Rare. Kanara: Santaveri (N. Kanara), Talbot ex Woodrow.—Distrib. India (W. Peninsula); Coylon.

5. GLORIOSA, Linn.

Climbing herbs; stems leafy, springing from a naked tuberous rootstock. Leaves alternate, opposite or 3-nately whorled, lanceolate, strongly nerved, with a long spiral tendril-like apex. Flowers large, showy, axillary, solitary; pedicels reflexed at the tip. Perianth petaloid, persistent; segments 6, subequal, spreading or reflexed, the margins often undulate. Stamens 6, hypogynous; filaments filiform; anthers linear, dorsifixed, versatile, dehiscing extrorsely. Ovary 3-celled; ovules numerous in each cell; style filiform, deflexed, with 3 subulate arms, stigmatose within. Fruit a large coriaceous septicidal capsule. Seeds subglobose; testa spongy, wing-like; embryo cylindric.—Distrib. Tropical Asia and Africa; species 3 or 4.

1. Gloriosa superba, Linn. Sp. Pl. (1753) p. 305. A herbaceous tall glabrous branching climber; rootstock of arched, solid, fleshy-white, cylindric tubers 6-12 by 1-13 in., pointed at each end, bifurcately branched or V-shaped, producing a new joint at the end of each branch; roots fibrous; stems annual, 10-20 ft. long, given off from the angles of the young tubers, herbaceous. Leaves sessile or nearly so, 3-6 by $\frac{3}{4}$ - $1\frac{3}{4}$ in., scattered or opposite, or sometimes (from the suppression of the internodes) ternately whorled, ovate-lanceolate, acuminate, tip ending in a tendril-like spiral, base cordate; nerves parallel. Flowers large, axillary, solitary, or subcorymbose towards the ends of the branches from the nearness of the leaves, remaining for about 7 days without withering; pedicels 3-6 in. long, the tips deflexed. Perianth-segments reaching 21 by 1-1 in., linear-lanceolate with crisply waved margins, greenish at first, then yellow, passing through orange and scarlet to crimson. Filaments 11-13 in. long, spreading; anthers nearly 1 in. long. Style reaching 2 in. long; the arms about 1 in. long. Capsules $1\frac{3}{4}$ by $\frac{3}{4}$ in., linear-oblong. The change of color which takes place during the time the flowers remain without drooping, has caused a discrepancy in descriptions by several authors, and new species have actually been founded in consequence of the variation. Fl. B. I. v. 6, p. 358; Grab. Cat. p. 221; Wight, Icon. t. 2047; Trim. Fl. Ceyl. v. 4, p. 294; Baker, in Journ. Linn. Soc. v. 17 (1879) p. 457; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1073; Watt, Dict. Econ. Prod. v. 3, p. 506. Methonica superba, Lam. Encyc. Méthod, v. 4 (1797) p. 133; Dalz. & Gibs. p. 250 (Methonia).—Flowers: July-Oct. VERN. Bachnág; Khadyánág.

KONKAN: Stocks!, Graham; Vingorla, Woodrow; along the Railway line between Karjat and Kalyan abundant, Cooks! Gujarat: Graham.—Distrib. Throughout Tropical India; Ceylon, Tropical Africa, Malacca, Cochinchina.

6. IPHIGENIA, Kunth.

Herbs with small tunicate corms; stems erect, slender, leafy. Leaves few, scattered, linear, the upper bract-like. Flowers small, erect, solitary or corymbose. Perianth petaloid, 6-partite, stellately spreading, deciduous; segments equal, narrow, clawed. Stamens 6, hypogynous; filaments short, flat; anthers oblong, versatile, introrsely attached. Ovary 3-celled; ovules numerous in each cell; styles 3, shortly connate below, free above, linear, recurved, stigmatose within. Fruit a loculicidal capsule. Seeds subglobose; testa thin, brown, appressed; albumen fleshy; embryo small.—Distrib. India, Africa, and Australia; species 4.

1. Iphigenia indica, A. Gray, in Kunth, Enum. v. 4 (1843) p. 213. Corm subglobose, $\frac{1}{2}-\frac{2}{3}$ in. in diam., narrowed into a short neck, tunicate

with pale brown sheaths; stem 3-10 in. high, rigid or flexuous. Leaves alternate, few, sessile, the lower 6-8 by $\frac{1}{6}-\frac{1}{2}$ in., the upper gradually smaller, all narrowly linear or linear-lanceolate, acuminate, coriaceous, base sheathing; nerves obscure. Flowers purple, few or many in a terminal erect raceme; bracts linear or subulate, the lower leafy; pedicels $\frac{1}{2}$ -1 in. long. Periauth-segments $\frac{2}{3}$ in. long, narrow, linear-subulate, acute, clawed, spreading or reflexed when the flower is fully expanded. Stamens $\frac{1}{3}$ in long; filaments flattened; anthers $\frac{1}{20}$ in. long, versatile. Ovary oblong, about as long as the stamens; styles 3, united at the base, $\frac{1}{10}$ in. long, recurved. Capsules oblong-ellipsoid or subobovoid, $\frac{2}{3}$ in. long, 3-grooved, obtuse. Seeds $\frac{1}{10}$ in. in diam., ellipsoid or subglobose, brown. Fl. B. I. v. 6, p. 357; Baker, in Journ. Linn. Soc. v. 17 (1879) p. 450; Trim. Fl. Ceyl. v. 4, p. 293; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1074; Watt, Dict. Econ. Prod. v. 4, p. 476. Anguillaria indica, Br. Prodr. (1810) p. 273; Grah. Cat. p. 222.—Flowers: June-July. Vern. Markallai.

Konkan: Stocks!, Law!, Nimmo ex Graham. Deccan: Poona, Woodrow; Khandala, Graham; Mahableshwar, H. M. Birdwood.—Distrib. Throughout India; Coylon, Australia, Philippines.

2. **Iphigenia pallida,** Baker, in Journ. Linn. Soc. v. 17 (1879) p. 451. Corm globose, $\frac{1}{2}$ in. thick, tunicate with pale brown sheaths; neck hypogoal; stem above ground 3-4 in. high, flexuous. Leaves usually 4, linear, grass-like, 3-4 by $\frac{1}{8}-\frac{1}{4}$ in., the upper smaller. Flowers 1-4, white or tinged with purple, corymbose; bracts linear, foliaceous; pedicels ascending, $\frac{1}{4}-\frac{1}{2}$ in. long. Perianth-segments $\frac{1}{6}-\frac{1}{4}$ by $\frac{1}{10}$ in., oblanceolate, acute, many-nerved. Stamens $\frac{1}{10}-\frac{1}{8}$ in. long; filaments flattened; anthers $\frac{1}{20}$ in. long, versatile. Ovary obovoid; styles 3, recurved, $\frac{1}{16}$ in. long. Capsules $\frac{1}{3}$ in. long, obovoid. Fl. B. I. v. 6, p. 357; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524.

KONKAN: Stocks! Deccan: Mahableshwar (ticket without authority in Herb. Kew.!). S. M. Country: Belgaum, Ritchie, 739!; Ghats near Belgaum, Stocks!—Distrib. India (W. Peniusula), apparently endemic.

7. SCILLA, Linn.

Herbs with tunicate bulbs. Leaves radical, linear, lorate or oblong. Flowers in racemes, on a simple leafless scape; bracts small. Perianth petaloid, persistent, stellate or campanulate; segments 6, subequal, often recurved. Stamens 6, adnate at or near the base of the perianth-segments; filaments usually filiform; anthers ovate or oblong, dehiscing introrsely. Ovary 3-celled; ovules usually few in each cell (often 2); style filiform; stigma small, capitate. Fruit a globose 3-lobed loculicidal capsule, the cells 1-2-seeded. Seeds obovoid or subglobose; testa thin, black; embryo shorter than the firm albumen.—Distrib. Europe, Temperate Asia; species about 80.

1. Scilla indica, Baker, in Saund. Refug. Bot. v. 3 (1870) App. p. 12. Bulb ovoid or globose, $1-1\frac{1}{2}$ in. in diam. Leaves appearing with the flowers, 3-6 by $\frac{1}{2}-1$ in., variable, from oblong to lanceolate or oblanceolate, subacute, narrowed into a sheathing petiole, rather fleshy, waved, obtusely keeled, sometimes rooting at the tips, dull green above and often blotched with black, paler and glaucous beneath. Scape

2-5 in. long, rather stout. Flowers greenish-purple, in cylindric, many-flowered racemes 2-4 in. long; bracts minute, scarious; pedicels filiform, \(\frac{1}{4} - \frac{3}{8}\) in. long. Perianth-segments \(\frac{1}{6} - \frac{1}{4}\) by \(\frac{1}{16} - \frac{1}{2}\) in., linear-oblong, obtuse. Filaments \(\frac{1}{6}\) in. long, purple; anthers \(\frac{1}{16}\) in. long, ellipsoid. Style \(\frac{1}{16} - \frac{1}{6}\) in. long. Capsules \(\frac{1}{6}\) in. long and broad, membranous. Fl. B. I. v. 6, p. 348; Baker, in Journ. Linn. Soc. v. 13 (1872) p. 250; Trim. Fl. Ceyl. v. 4, p. 293; Wooder in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1074; Watt, Diet. Econ. Prod. v. 6, part 2, p. 489. Scilla maculata, Baker, in Journ. Linn. Soc. v. 13 (1872) p. 250. Ledebouria maculata, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 143; Dalz. & Gibs. p. 251. Ledebouria hyacinthina, Roth, Nov. Pl. Sp. (1821) p. 195; Wight, Icon. t. 2040; Grah. Cat. p. 220; Dalz. & Gibs. p. 251; Bot. Mag. t. 3226.—Flowers: May-July.

Dalzell without locality in Horb. Kew.! Konkan: Stocks! Deccan: Mahableshwar, very common, appearing with the first fall of rain at the end of May or beginning of June, Cooke!, H. M. Birdwood; Alandi, Woodrow! S. M. Countur: Belgaum, Ritchie, 733!; Castlerock, Woodrow.—Distrib. India (Behar, Central India, Chota Nagpur, W. Peninsula); Coylon, Abyssinia.

8. URGINEA, Steinh.

Herbs with tunicate bulbs. Leaves radical, linear or lorate. Flowers racemose on a long leafless scape, often appearing before the leaves; pedicels short or long, articulate; bracts small. Perianth petaloid, campanulate; segments 6, subequal. Stamens 6, adnate at or near the base of the perianth-lobes, included; filaments filiform or thickened at the base; authers oblong or linear, dehiscing introrsely. Ovary 3-celled, often 3-gonous; ovules numerous in each cell; style tapering towards the base. Fruit an oblong, 3-quetrous, loculicidal capsule. Seeds usually many in each cell, compressed; testa black; embryo rather large; albumen fleshy.—Distrib. Species about 24, S. European, W. Asiatic, and African.

1. Urginea indica, Kunth, Enum. v. 4 (1843) p. 333. Bulb pale, 2-4 in. long, ovoid, thick. Leaves appearing after the flowers, 6-18 by \frac{1}{2}-1 in., nearly flat, sub-bifarious, linear, acute. Scape crect, brittle, 12-18 in. long by \frac{1}{6}-\frac{1}{4} in. diam. at the base. Flowers dingy brown (Dalzell & Gibson), very distant, in slender laxly flowered racemes 6-12 in. long; bracts minute, soon falling; pedicels 1-1\frac{1}{2} in. long, slender, spreading or decurved. Perianth campanulate; segments \frac{3}{3} by \frac{1}{10}-\frac{1}{8} in., oblong-oblanceolate, obtuse, with 2 or 3 strong approximate nerves down the middle. Stamens rather more than \frac{1}{4} in. long; filaments flattened; anthers \frac{1}{10} in. long. Style obconic. Capsules ellipsoid, tapering to both ends, \frac{1}{2}-\frac{2}{4} in. long, the cells 6-9-seeded. Seeds elliptic, \frac{1}{4} by \frac{1}{8} in., flattened, black. Fl. B. I. v. 6, p. 347; Dalz. & Gibs. p. 250; Baker, in Journ. Linn. Soc. v. 13 (1872) p. 222; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1075; Watt, Diet. Econ. Prod. v. 6, part 4, p. 213. Scilla indica, Roxb. Fl. Ind. v. 2 (1832) p. 147; Grah. Cat. p. 220 (not of Baker).—Vern. Jangli-piaz.

KONKAN: Stocks!; common on the sandy shores of both Konkans, Graham, Nairne, Dalzell; Harni, on the coast below Bombay, Dalzell & Gibson.—Distrib. India (Wostern Himalaya, Behar, Chota Nagpur, Birma, W. Peninsula especially near the sea); Tropical Africa.

Used in medicine as a substitute for the true Squill.

9. DIPCADI, Medic.

Tuberous scapigerous herbs. Leaves usually narrowly linear. Flowers racemose, bracteate. Perianth tubular; tube cylindric; segments 6, erect, the outer recurved from about the middle, the inner at the tips only. Stamens 6, inserted in the throat of the perianth, included; filaments short or 0; anthers linear, versatile, dehiscing introrsely. Ovary stipitate or sessile, 3-celled; ovules many in each cell; style short, straight; stigma 3-lobed. Capsule membranous, subglobose or broadly obovate, deeply 3-sulcate, sessile or stalked, loculicidally 3-valved, few- or many-seeded. Seeds in each cell 6-20, compressed; testa black, membranous.—Distrib. Europe, W. Asia, Africa; species about 27.

Orary stipitate.	
Flowers more than \$\frac{2}{3}\$ in. long, usually about \$1\frac{1}{3}\$ in. long	1. D. concanense.
Flowers less than 3 in. long.	
Pedicels not longer than the bracts	2. D. montanum.
Pedicels capillary, longer than the bracts	
Ovary not stipitate	4. D. cruthræum.

1. Dipcadi concanense, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 143 (Uropetalum). Bulb tunicate, small, \(\frac{1}{2}\)-\frac{3}{4} in. in diam. Leaves 3-4, subfleshy, 5-10 in. long, semiterete, linear-subulate, scarcely more than \(\frac{1}{12}\) in. thick. Scape terete, 6-12 in. long, smooth, naked. Flowers white, in 2-6-flowered racemes 2-5 in. long; bracts \(\frac{1}{5}\)-\frac{1}{6} in. long, triangular, acuminate, shorter than the pedicels; pedicels \(\frac{1}{4}\)-\frac{1}{2} in. long. Perianth \(\frac{1}{2}\) in. long; the 3 outer lobes rather less than \(\frac{1}{2}\) in. long by \(\frac{1}{10}\) in. wide, linear, obtuse, many-nerved; the 3 inner lobes connate to about the middle, the free portion \(\frac{1}{3}\) in. wide, oblong-lanceolate, obtuse, with 5 close parallel nerves. Filaments flattened, \(\frac{1}{4}\) in. long; anthers \(\frac{1}{3}\)-\(\frac{1}{6}\) in. long. Ovary \(\frac{1}{3}\) in. long, obovoid, distinctly stalked; style 1 in. long; stigma 3-lobed, the lobes \(\frac{1}{20}\) in. long. Capsules broader than long, \(\frac{3}{8}\) by \(\frac{1}{2}\) in. Seeds ellipsoid, flattened, \(\frac{1}{4}\) by \(\frac{1}{6}\) in., black. Fl. B. I. v. 6, p. 346; Baker, in Journ. Linn. Soc. v. 11 (1870) p. 399; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524. Uropetalum concanense, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 143; Dalz. & Gibs. p. 250.

KONKAN: rocky places in Malwan, Dalzell!—Distrib. India (W. Peninsula), apparently endemic.

2. **Dipcadi montanum**, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 142 (Uropetalum). Bulb tunicate, globose, 1 in. in diam. Leaves 5-11 by $\frac{1}{1_0} - \frac{1}{6}$ in., narrowly linear, acute. Scape 8-12 in high, subterete, smooth, naked. Flowers white, in ultimately lax 6-10-flowered racemes $3-4\frac{1}{2}$ in. long; bracts $\frac{2}{6}$ in. long, lanceolate, finely acuminate; pedicels $\frac{1}{4} - \frac{2}{6}$ in. long, filiform. Perianth a little more than $\frac{1}{2}$ in. long; the 3 outer lobes as long as the tube, elliptic-oblong, obtuse, $\frac{1}{6}$ in. wide, with 5 close conspicuous parallel nerves in the middle and with an indurated apex. Stamens attached at the base of the perianth-lobes; filaments $\frac{1}{10}$ in. long, flattened; anthers $\frac{1}{12}$ in. long, versatile. Ovary $\frac{1}{4}$ in. long (including a stalk about $\frac{1}{16}$ in. long), obovoid; style rather less than $\frac{1}{4}$ in. long; stigma 3-lobed, the lobes about $\frac{1}{3}$ in. long. Capsules stalked, broader than long, reaching $\frac{3}{10}$ by $\frac{1}{2}$ in., 3-5-seeded. Seeds $\frac{1}{6}$ by $\frac{1}{10}$ in., ellipsoid, flat, dull black. Fl. B. I. v. 6, p. 346; Baker, in Journ. Linn. Soc. v. 11 (1870) p. 398; Woodr. in Journ.

Bomb. Nat. v. 12 (1899) p. 524. Uropetalum montanum, Dalz. l. c.; Dalz. & Gibs. p. 250.—Flowers: July-Aug.

Decean: Western Decean, Dalzell & Gibson; Sahyadri range, lat. 19°, Dalzell!; Junnar near Poona, Woodrow! S. M. Countar: Belgaum, Stocks!, Dalzell & Gibson, Ritchic, 1454!—Distrib. India (W. Peninsula).

Trimen (Fl. Coyl. v. 4, p. 201) gives this for Coylon, but the description renders

the identification doubtful.

3. **Dipcadi minor**, *Hook. f. Fl. B. I.* v. 6 (1892) p. 346. Racemes 6-12-flowered; bracts much shorter than the capillary pedicels. Perianth $\frac{1}{3}$ — $\frac{1}{2}$ in. long; outer lobes as long as the tube.

There is but one sheet in Herb. Kew. containing a few scraps of the plant collected by Dalzell. The specimens have neither bulbs, leaves, nor fruit. Dalzell on the sheet gives "Hewra Plain" as its habitat. In the 'Flora of British India' (v. 6, p. 346) the localities "Malwan" and "Hewra Plain" have been transposed.

Malwan is given by Dalzell as the habitat of D. concanense, Hewra Plain as that of

D. minor.

4. **Dipcadi erythræum**, Webb & Berth. Hist. Nat. Canar. v. 3 (1848) p. 341. Bulb tunicate, $\frac{1}{2} - \frac{7}{8}$ in. in diam. Leaves 6-8 by $\frac{1}{8} - \frac{1}{6}$ in., narrowly linear. Scape 4-7 in. long. Flowers greenish, in lax 6-12-flowered racemes 4-6 in. long; bracts $\frac{2}{8} - \frac{7}{8}$ in. long, the lower the longest, ovate, finely acuminate; pedicels $\frac{1}{6} - \frac{1}{3}$ in. long. Perianth campanulate, $\frac{5}{8}$ in. long; outer lobes $\frac{2}{8}$ by $\frac{1}{6}$ in., elliptic-oblong, obtuse, with indurated tips, 7-nerved; inner lobes similar, 5-nerved. Ovary sessile, $\frac{1}{4}$ in. long, elliptic-obovoid. Capsules $\frac{1}{2} - \frac{5}{8}$ in. long and as broad, slightly cuneate at the base, on a stout stalk $\frac{1}{6} - \frac{1}{4}$ in. long, transversely veined. Seeds $\frac{1}{4} - \frac{7}{16}$ in. in diam., orbicular, flat, black. Dipcadi unicolor, Baker, in Journ. Linn. Soc. v. 11 (1870) p. 397; Hook. f. Fl. B. I. v. 6, p. 346; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524.

Sind: Jemadar ka Landa near Karachi, Stocks, 634!; lower hills of Sind, Stocks!, Dalzell!—Distrib. Arabia, Egypt.

10. ASPHODELUS, Linn.

Annual or perennial herbs; root-fibres slender or fleshy. Leaves radical, linear, 3-quetrous, or terete and fistular. Flowers racemose, on a simple or branched leafless scape; pedicels jointed, solitary in the axils of small scarious bracts. Perianth petaloid, marcescent; segments 6, free or shortly connate below. Stamens 6, hypogynous, shorter than the perianth-segments; filaments dilated at the base, enclosing the ovary; anthers oblong or almost linear, versatile, the filament inserted in a pit at the back of the connective. Ovary 3-celled; ovules 2 in each cell, collateral; style filiform; stigma somewhat 3-lobed. Fruit a globose loculicidal capsule with rugose partitions. Seeds usually solitary in each cell of the capsule; testa black, usually rugose; albumen cartilaginous; embryo rather large.—Distrib. Species 6 or 7, S. Europe and eastward to India.

1. Asphodelus tenuifolius, Cav. in Ann. Cienc. Nat. v. 3 (1801) p. 46, t. 27, fig. 2. Annual. Leaves 6-12 by $\frac{1}{16} - \frac{1}{6}$ in., terete, fistulous, acute, sheathing at the base, finely puberulous. Scapes several from the root, smooth or puberulous, much branched in the upper part, 1-2 ft. high. Flowers white, distant, laxly racemose, solitary in each bract; pedicels $\frac{1}{b} - \frac{1}{4}$ in. long, jointed below the middle; bracts broadly

ovate, cymbiform, acute, $\frac{1}{10}$ in. long, scarious, with a strong brownish keel. Perianth $\frac{1}{6} - \frac{1}{5}$ in. long; segments oblong, obtuse, $\frac{1}{10}$ in. wide, with a strong conspicuous brownish costa. Stamens $\frac{1}{6}$ in. long; filaments slightly fusiform towards the top; authers $\frac{1}{20}$ in. long. Style $\frac{1}{12}$ in. long; stigma small, subcapitate, minutely 3-lobed. Capsules globose, $\frac{1}{6} - \frac{1}{5}$ in. in diam., erect, the valves deeply wrinkled. Seeds $\frac{1}{6}$ in. long, sharply 3-gonous, acute, black. Fl. B. I. v. 6, p. 332; Cav. lcon. t. 587, fig. 2; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523; Prain, Beng. Pl. p. 1076. Asphodelus clavatus, Roxb. Fl. Ind. v. 2 (1832) p. 148; Graham, Cat. p. 219. A. fistulosus var. tenuifolius, Baker, in Journ. Linn. Soc. v. 15 (1875) p. 272. Asphodelus pauciflorus, Wight, Icon. v. 6 (1853) p. 27 (A. parviflorus in Tab. 2062). Asphodelus fistulosus, Watt, Dict. Econ. Prod. v. 1, p. 346.—Flowers: Nov.—Feb.

DECCAN: Kirkee, J. G. Woodrow! Gujarat: Woodrow; Ahmedabad, Law ex Graham, Bhita!—Distrib. Throughout India in fields; westward to the Canary Islands.

11. CHLOROPHYTUM, Ker.

Herbs with a short hard rootstock emitting many fascicled roots, often thick and fleshy and tuber-like. Leaves radical, clustered, often broad, rarely linear or lorate. Flowers laxly racemose on a simple or branching leafless scape; pedicels usually fascicled in the axils of small scarious, or large membranous bracts. Perianth petaloid, marcescent or persistent, rarely deciduous; segments free, rotate. Stamens 6, hypogynous, free or the 3 inner adnate to the perianth-segments, included; filaments filiform, often widened above the middle; anthers oblong or linear, dehiscing introrsely, the filament inserted in a small pit on the back of the connective. Ovary 3-quetrous, 3-celled; ovules 4 or more in each cell; style filiform; stigma small. Fruit a coriaceous truncate or emarginate, 3-winged, loculicidal capsule. Seeds broad, usually compressed; testa black; albumen rather hard; embryo often curved, rather large.—Distrib. Species about 40, tropical and subtropical.

Flowers in simple or shortly branched dense-flowered racemes.

Leaves lanceolate or oblanceolate, petiolate.

Scape 3-6 in. long, naked

Scape 1-2 ft. long, bracteate

Leaves linear or lorate, not petiolate.

Scape as long as the leaves; perianth-segments \(\frac{1}{2} \) by

\(\frac{1}{7} \) in., oblancedate, 5-nerved

Scape longer than the leaves; perianth-segments \(\frac{1}{2} \) by

\(\frac{1}{2} \) in., oblang, 7-nerved

Thowers in simple or branched racemes, remotely scattered, solitory or in points.

1. Chlorophytum breviscapum, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 141. Root-fibres with oblong tubers pendulous from them. Leaves 6-9, membranous, 12-14 by \frac{3}{3}-1\frac{1}{2}\ \text{in., linear-oblong or oblong-lanceolate, acuminate, flat, with undulate margins, shining above, pale beneath, attenuated towards the base in a broad petiole. Scape 4-8 in. long (rarely branched), naked. Flowers white, in usually simple racemes 2-4 in. long; bracts membranous, ovate-lanceolate, with a long

3 E 2

acumination, the lower bracts $\frac{1}{2}$ - $\frac{3}{4}$, the upper $\frac{5}{6}$ in. long; pedicels 2-4-nate, $\frac{1}{4}$ - $\frac{1}{3}$ in. long, jointed near the top. Perianth rather more than $\frac{3}{6}$ in. long; segments linear, acute, $\frac{1}{12}$ in. broad, 3-nerved. Stamens $\frac{1}{3}$ in. long; anthers $\frac{1}{5}$ in. long, linear-oblong. Style $\frac{1}{6}$ in. long, slender; stigma minute. Capsules ' emarginate, acutely 3-winged, $\frac{3}{6}$ in. in diam., the Seeds globose, compressed, $\frac{1}{6}$ in. in diam., finely papillose, black. Fl. B. I. v. 6, p. 333; Dalz. & Gibs. p. 252; Baker, in Journ. Linn. Soc. v. 15 (1875) p. 323; Watt, Dict. Econ. Prod. v. 2, p. 269.—Flowers: July-Aug.

Stocks without locality in Herb. Kew.! Konkan: Malwan, Dalzell! S. M. Countan: Belgaum Ghats, Ritchie, 1457!—Distrib. India (Sikkim Himalaya, W. Peninsula).

2. Chlorophytum glaucum, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 142. Root-fibres cylindric. Leaves 6-8, membranous, 12-18 by 1-2 in., narrowly oblanceolate, acute, glabrous, glaucous, attenuated into a short broad petiole. Scape strict, erect, simple, 1-2 ft. long, clothed with many narrowly lanceolate sheaths. Flowers white, in simple dense racemes 6-12 by 1 in.; bracts persistent, forming a terminal coma before flowering, lanceolate, acuminate, the lower \(\frac{3}{4}\)-1 in. long, the upper \(\frac{1}{4}\)-\frac{1}{2} in. long; pedicels ascending, \(\frac{1}{4}\)-\frac{1}{2} in. long, slender, jointed at or above the middle, the lower 2-3-nate. Perianth-segments less than \(\frac{1}{2}\) in. long by \(\frac{1}{6}\) in. broad, linear-lanceolate, sub-obtuse, 5-nerved. Stamens \(\frac{1}{3}\) in. long; filaments minutely papillose; anthers \(\frac{1}{6}\) in. long. Style \(\frac{1}{3}\) in. long; stigma minute. Capsules glebose, emarginate, acutely 3-winged, the cells 2-4-seeded. Seeds orbicular, \(\frac{1}{6}\) in. in diam., compressed, dull black, not papillose. Fl. B. I. v. 6, p. 334; Dalz. & Gibs. p. 252; Baker, in Journ. Linn. Soc. v. 15 (1875) p. 324; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523; Dalz. & Gibs. p. 252.

Slocks without locality in Herb. Kew.! Konkan: Law!; Sahyadri range, lat. 160-180, Dalzell! Kanara: Law!—Distrib. India (W. Peninsula), apparently endemic.

3. Chlorophytum attenuatum, Baker, in Journ. Linn. Soc. v. 15 (1875) p. 332. Roots fleshy (not or rarely tuberous). Leaves 6-9, membranous, 9-18 by ½-1 in., linear, acute, slightly narrowed at the base, with 15-20 distinct immersed veins. Scape glabrous, naked, erect, as long as the leaves. Flowers white, in simple (rarely forked) racemes 3-6 in. long, dense in the upper part; bracts ovate-lanceolate, acuminate, the upper ½-½, the lower ½-1 in. long; pedicels erect, jointed about the middle, 2-3-nate, ½-½ in. long. Perianth-segments ½ by ½ in. long; flaments ½ in. long, longer than the authers; anthers narrowly linear. Style ¼ in. long. Capsules globose, acutely 3-winged, broadly obcordate, ¼ in. in diam.; cells 3-4-seeded. Fl. B. I. v. 6, p. 335; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523. Phalangium attenuatum, Wight, Icon. v. 6 (1853) p. 21, t. 2037.—Flowers: rainy season.

KONKAN: Stocks !, Law !- DISTRIB. India (W. Peninsula), apparently endemic.

4. Chlorophytum tuberosum, Baker, in Journ. Linn. Soc. v. 15 (1875) p. 332. Root-fibres cylindric, with ellipsoid tubers hanging from them. Leaves 6-12, membranous, sessile, 6-12 by \(\frac{1}{2}\)-1 in., shorter than the scape, usually falcate, recurved, accuminate, the margins

undulate. Scape terete, naked, 3-12 in. long. Flowers white, in simple or shortly branched racemes 2-4 in. long by 1-1½ in. wide when expanded; bracts lanceolate, acuminate, the lower ½-¾ in. long; pedicels asconding, ¼-½ in. long, jointed below the middle. Perianth-segments less than ½ in. long by ⅓ in. broad, oblong-lanceolate, subacute, 7-9-nerved. Stamens ⅓ in. long; anthers ⅙-⅙ in. long, narrowly linear, ultimately twisted. Stigma minute. Capsules obovoid, ⅙ by ⅙ in., shining, transversely veined, emarginate, the cells 4-6-seeded. Seeds irregularly orbicular, ⅙ in. in. diam., black. Fl. B. I. v. 6, p. 334; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523; Prain, Beng. Pl. p. 1077. Chlorophytum anthericoideum, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 141; Dalz. & Gibs. p. 251. Phalangium tuberosum, Wight, Icon. v. 6 (1853) p. 21, t. 2036. Anthericum tuberosum, Roxb. Fl. Ind. v. 2 (1832) p. 149; Grah. Cat. p. 219.—Flowers: July. Vern. Kuli.

RONKAN: Stocks!, Law!, Dalzell! Deccan: Poona, Woodrow, 101!, Jacquemont, 555!; Bowdhan near Poona, Bhiva!—Distrib. India (E. Himalaya, Behar, W. Bengal, Birma, W. Peninsula); Abyssinia.

- 5. Chlorophytum orchidastrum, Lindl. in Bot. Reg. (1824) t. 813. Whole plant 3 ft. high; root-fibres tuberous. Leaves 6-9, membranous, 12-24 by \(\frac{1}{2}-3\frac{1}{2}\) in., elliptic-lanceolate, acute, strongly nerved, glabrous and shining on both sides, narrowed at the base into a winged petiole 6-9 in. long. Scape 1 ft. long, thick, terete, naked. Flowers white, in very lax panicles 1-2 ft. long, the branches each with a large lanceolate acute bract reaching sometimes 11 in. long, at the base; bracts of the inflorescence $\frac{1}{4}-\frac{1}{2}$ in. long, ovate-lanceolate; pedicels ascending, usually geminate, $\frac{1}{4}-\frac{1}{2}$ in. long, jointed about the middle. Perianth-segments $\frac{3}{8}$ by $\frac{1}{8}$ in., oblong-lanceolate, subacute, Stamens 1 in. long; anthers 1 in. long. Style 1 in. long. Capsules 4 by 3 in., depressed-globose, deeply lobed at the apex, broader than long, transversely veined. Seed solitary, flattened, rather broader than long, orbicular or subreniform, minutely papillose, dull black. Fl. B. I. v. 6, p. 336; Baker, in Journ. Linn. Soc. v. 15 (1875) p. 325; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523. Chlorophytum Nimmonii, Dalz, in Kew Journ, Bot. v. 2 (1850) p. 142; Dalz, & Gibs. p. 252. Phalangium oligospermum, Wight, Icon. v. 6 (1853) p. 21, t. 2038. Anthericum Nimmonii, Grah. Cat. p. 220.—Flowers: July-Aug.
- Konkan: Stocks!, Dalzell! S. M. Country: Cheeta Hill, Belgaum, Ritchie, 1460!
 —Distrib. India (W. Peninsula); Tonkin, Tropical Africa.
- 6. Chlorophytum laxum, R. Br. Prodr. (1810) p. 277. A low plant rarely exceeding 1 ft. high; root-fibres usually with small oblong tubers hanging from them. Leaves 6-12, grass-like, 6-12 by $\frac{1}{b}$ (rarely $\frac{1}{2}$) in., subdistichous, usually sprending and recurved, longer than the scape, narrowly linear, falcate, flat or folded, acute, glabrous, with numerous conspicuous nerves. Scape very slender, flexuous, 1-3 in. long, naked. Flowers few, greenish-white, very distant (sometimes 1 in. apart), in lax very slender simple or forked racemes 3-10 in. long, with scarious ovate-lanceolate acuminate bracts $\frac{5}{8}$ in. long at the base of the branches when forked; bracts of the inflorescence the lower $\frac{1}{3}$, the upper $\frac{1}{2}$ in. long, ovate, acuminate; pedicels jointed about the middle, short, becoming longer and drooping in truit, the lower sometimes geminate.

Periauth-segments $\frac{1}{8}$ - $\frac{1}{6}$ by $\frac{1}{16}$ in., oblong, obtuse, obscurely 3-nerved. Stamens alternately short and long, the longer $\frac{1}{12}$, the shorter $\frac{1}{16}$ in. long; anthers $\frac{1}{30}$ in. long, subglobose, green. Style $\frac{1}{26}$ in. long. Capsules $\frac{1}{6}$ by $\frac{1}{4}$ in., broadly obcordate, 3-winged, the cells 1-4-seeded. Seeds $\frac{1}{6}$ in across, irregularly angled, black, minutely papillose. Fl. B. I. v. 6, p. 336; Trim. Fl. Ceyl. v. 4, p. 290; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523. Chlorophytum laxiflorum, Baker, in Journ. Linn. Soc. v. 15 (1875) p. 328 (by error). C. parviflorum, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 141; Dalz. & Gibs. p. 251.—Flowers: July.

Dalzell without locality in Herb. Kew.! Konkan: Dalzell! Deccan: Cooke! S. M. Country: Kákti Hills, Belgaum, Ritchic, 1458!; Dharwar, on stony ground, Talbot, 2498! Kanara: Tinai Ghát (N. Kanara), Talbot, 2553!—Distrib. India (W. Peninsula); Coylon, China, Borneo, Tropical Africa and Australia.

A large number of non-indigenous plants belonging to the Order are grown in gardens, of which a few of the most common are the following:—

Aloe vera, Linn. Sp. Pl. (1753) p. 320. A native of the Mediterranean region. Leaves ensiform, dense, aggregate, 2-4 in. broad, narrowed from base to apex, pale green, with distant horny prickles on the margins. Scape 2-3 ft. long, simple or branched. Raceme dense, 6-12 in. long. Perianth yellow, cylindric, \(\frac{3}{4}\)-1 in. long. Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523; Watt, Dict. Econ. Prod. v. 1, p. 186.—VDRN. Yellia.

Aloc variegata, Linn. Sp. Pl. (1753) p. 321. A native of S. Africa. Leaves close, erecto-patent, 4-5 by 1 in., lanceolate, bright green spotted with grey and with whitish denticulate margins. Scape simple, tapering, 6-8 in. long. Raceme simple, 3-4 in. long. Perianth reddish, 1-1; in. long. Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523.—Vern. Chota-Yellia.

Agapanthus umbellatus, L'Hérit. Sert. Angl. (1788) p. 17. A native of S. África known as the African Blue Lity, introduced into Bombay by Nimmo. Leaves numerous, radical, linear, somewhat fleshy. Scapes tall, bearing many-flowered umbels of bright blue flowers. Perianth funnel-shaped. The plant grows well at Mahableshwar, but when brought to the plains, flowers freely for a time and then dies. Grah. Cat. p. 217; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523, & Gard. in Ind. ed. 5, p. 497.—Flowers: May.

Fucca gloriosa, Linn. Sp. Pl. (1753) p. 319. A native of the West Indies known as Adam's Needle, almost naturalized in Indian gardens. A magnificent aloe-like plant with lanceolate, sharp-pointed leaves and bearing during the rainy season a large panicle of creamy-white flowers as large as a hen's egg. Grab. Cat. p. 221; Dalz. & Gibs. Suppl. p. 93; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523, & Gard. in Ind. ed. 5, p. 502; Watt, Dict. Econ. Prod. v. 6, part 4, p. 321.—Vern. Facca.

Yucca aloifolia, Linn. Sp. Pl. (1753) p. 319. A native of the West Indies to North Carolina. Tall, with a slender stem 10-15 ft. high. Leaves 50-100, rigid, ensiform, 1-12 ft. by 1-14 in., somewhat glaucous,

with a pungent reddish-brown horn at the tip, the margins whitish, serrulate. Flowers in dense rhomboid panieles 1-2 ft. long, with ascending branches. Perianth white, $1\frac{1}{2}$ -2 in. long. Grah. Cat. p. 221; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523; Bot. Mag. t. 1700.

Cordyline terminalis, Kunth, Enum. v. 5 (1850) p. 25. A native of the South Sea Islands, largely cultivated in tropical countries. It is an erect glabrous shrub 8-10 ft. high, with distichous green or purplish, oblong-lanceolate acuminate leaves, narrowed at the base, 1-3 ft. by 2-5 in., and subsessile white flowers in branched panicles. Fl. B. I. v. 6, p. 331; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523, & Gard. in Ind. ed. 5, p. 516; Prain, Beng. Pl. p. 1072.

The so-called Dracanas of Indian gardens are mostly forms or varieties

of this plant.

Van. ferrea, Baker, in Journ. Linn. Soc. v. 14 (1874) p. 540. Leaves narrower, more oblanceolate, dull purple or variegated, 2-2½ in. broad; flowers usually smaller, tinged with purple. Dracana ferrea (sp.), Linn. Syst. ed. 12 (1767) p. 246; Bot. Mag. t. 2053; Grah. Cat. p. 221; Dalz. & Gibs. Suppl. p. 93. Common in gardens, introduced from China (Graham).

Allium ascalonicum, Linn. Amæn. Acad. v. 4 (1759) p. 454. Leaves fistular, basal only; heads dense, with flowers only. The Shallot, cultivated. Fl. B. I. v. 6, p. 337; Grah. Cat. p. 220; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523; Prain, Beng. Pl. p. 1075; Watt, Dict. Econ. Prod. v. 1, p. 168.

Allium Cepa, Linn. Sp. Pl. (1753) p. 300. Leaves fistular, subdistichous; heads dense, with flowers and bulbils. The Onion, much cultivated as a cold season crop throughout the Deccan and Gujarat. The Onions of Bombay are well known and celebrated throughout India. Fl. B. I. v. 6, p. 337; Grah. Cat. p. 220; Dulz. & Gibs. Suppl. p. 92; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523; Prain, Beng. Pl. p. 1075; Watt, Dict. Econ. Prod. v. 1, p. 169.—Vern. Piaz.

Allium ampeloprasum, Linn. Sp. Pl. (1753) p. 294. Leaves flat; heads dense, bearing flowers only; bulb long cylindric, simple. The Leck, cultivated. Fl. B. I. v. 6, p. 337; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523; Prain, Beng. Pl. p. 1075. Allium Porrum, Linn. Sp. Pl. (1753) p. 295; Roxb. Fl. Ind. v. 2 (1832) p. 141; Grah. Cat. p. 221; Dalz. & Gibs. Suppl. p. 92; Watt, Diet. Econ. Prod. v. 1, p. 171 (Porum).—Vern. Khorát.

Allium sativum, Linu. Sp. Pl. (1753) p. 296. Leaves flat; heads lax, bearing both flowers and bulbils; bulb short, compressed. Garlic, widely cultivated in irrigated lands of the Deccan and S. M. Country. Fl. B. I. v. 6, p. 337; Grah. Cat. p. 220; Dalz. & Gibs. Suppl. p. 92; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523; Prain, Beng. Pl. p. 1075; Watt, Diet. Econ. Prod. v. 1, p. 172.—Vern. Lasan.

Lilium neilgherrense, Wight, Icon. v. 6 (1853) p. 20, tt. 2031-32. A native of the Nilghiri and Pulney Hills, growing about 3 ft. high. Leaves lanceolate, shining, 5 by 3 in., 3-5-nerved. Flowers white,

tinged with green outside, trumpet-shaped, 8 in. or more long and 5 in. across at the mouth, fragrant. Fl. B. 1. v. 6, p. 350; Woodr, Gard. in Ind. ed. 5, p. 501.

Lilium giganteum, Wall. Tent. Fl. Nep. (1826) p. 21, tt. 12, 13. A splendid species, a native of the Himalayas, with a tall stem reaching 10 ft. high. Lower leaves ovate, cordate, 1 ft. or more long and broad, with petioles 9-12 in. long. Racemes 1-2 ft. long; flowers 5-7 in. long and 4 in. across, fragrant, white, slightly tinged with green outside and with a purplish throat. Fl. B. I. v. 6, p. 349; Woodr. Gard. in Ind. ed. 5, p. 502; Watt, Diet. Econ. Prod. v. 4, p. 640.—Flowers: Aug.—Sept.

Dianella ensifolia, Redouté, Lil. v. 1 (1802) t. 1. Stem 3-6 ft. high, rigid. Lower leaves 1-2 ft. by $\frac{3}{4}-1\frac{1}{2}$ in., linear-lanceolate, Flowers inodorous, white, greenish or bluish, in panicles 1-2 ft. long. Perianth $\frac{1}{4}-\frac{1}{3}$ in. long. Berry dark purple or blue, $\frac{1}{3}$ in. in diam. A native of the Tropical Himalaya, the Khasia Hills, Birma, and Ceylon, often grown in gardens. Fl. B. I. v. 6, p. 337; Dulz. & Gibs. Suppl. p. 93; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 523.

ORDER CXXXIII. PONTEDERIACEÆ.

Fresh-water and marsh herbs, erect or floating. Leafy stems 1-foliolate. springing from the buried rootstock or from the joints of the floating stem; basal leaf long-petiolate, blade floating or upraised. Flowers hermaphrodite, racemose or spicate, rarely fasciculate or paniculate at the ends of 1-leaved stems or branches; bract under inflorescence spathe-like; bracts under the flowers minute or obsolete. Perianth inferior, petaloid, marcescent, usually tubular; lobes 6, sub-2-seriate, similar or the 3 inner smaller. Stamens 6 or 3, unequally adnate to the perianth-tube or the base of the perianth-lobes, usually declinate, the upper shorter; filaments free; anthers oblong (rarely ovate), with 2 parallel distinct cells. Ovary superior, 3-celled with axile placentas, or 1-celled with parietal placentas, each placenta with many 2-seriate oyules (sometimes only one in each cell fertile), anatropous; style filiform or columnar : stigma terminal, entire or lobed. Fruit a dry, membranous, loculicidally 3-valved (rarely indehiscent) capsule. Seeds ovoid or ellipibbed; albumen floury or horny; soid, small; tes' embryo central, Genera 5; species about 36.

1. MONOCHORIA, Presl.

Aquatic herbs; rootstock creeping, clothed with leaf-sheaths. Leaves radical and solitary at the top of the emerging stem or branches, ovate-cordate, sagittate or lanceolate; petioles of the radical leaves long, those of the cauline leaves shorter. Flowers in a raceme, sessile within the axil of the cauline leaf and fasciculately long-pedicellate, or pedunculate and subspicately short-pedicellate. Perianth campanulate; tube 0; lobes 6, distinct, subequal. Stamens 6, adnate to the base of the perianth-lobes, or hypogynous, one usually largest with its filament toothed on one side; authors basifixed, dehiscing by a terminal ultimately elongate slit. Ovary 3-celled; ovules many in each cell; style filiform;

stigma minutely 3-lobed. Fruit an oblong membranous loculicidal capsule. Seeds many, ovoid, obtuse, many-ribbed; embryo cylindric in the centre of floury albumen.—Distrib. Species about 6, in the tropics of the Old World.

1. Monochoria hastæfolia, Presl, Reliq. Hænk. v. 1 (1830) p. 128. Rootstock stout, creeping and rooting below, spongy, clothed with the remains of old sheaths. Leaves 4-8 by 2-6 in., sagittate, hastate, or cordate, obtuse, acute, or acuminate, smooth and glossy, many-nerved, the basal sinus more or less deep; petioles of the floral leaves tumid above and embracing spathe-like the short stout peduncle; petioles of the radical leaves 12-2 ft. long with a broad sheathing base. Inflorescence centrifugal; flowers of a brilliant purplish-blue, crowded, racemose or subumbellate; pedicels variable in length, rarely reaching as much as 1 in. long. Perianth-segments 5 in. long, twisting corkscrew-fashion round the fruit when withering; large segments obovate, 1 in. wide, the smaller segments oblong, \(\frac{1}{6} \) in. wide, all with 3 strong parallel nerves in the middle and finely veined at each side of the nerves, reticulately so towards the margin. Filament of the large anther $\frac{1}{6}$ inch long with an acute horn 12 in. long at one side; anthers linear-oblong, the large anther blue, $\frac{1}{5}$ in. long, the small anthers yellow, rather more than $\frac{1}{8}$ in. Ovary ellipsoid or ovoid, $\frac{1}{6}$ in. long; style $\frac{1}{4}$ in. long; stigma obscurely 3-lobed. Capsules & in. long, ellipsoid. Seeds ellipsoid, rounded at both ends, $\frac{1}{30}$ in. long, pale, with many fine brown ribs. Fl. B. I. v. 6, p. 362; Trim. Fl. Ceyl. v. 4, p. 295; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1079. Monochoria hastata, Solms-Laub. in DC. Monogr. Phan. v. 4 (1883) p. 523. Pontederia hastata, Linn. Sp. Pl. (1753) p. 288; Grah. Cat. p. 222; Dalz. & Gibs. p. 249; Roxb. Cor. Pl. v. 2, t. 111.—Flowers: Dec.

Margins of tanks and water-holes common, Dalzell & Gibson. Rice-fields and margins of tanks, Graham. Diccan: Poona, Cooke!; Sholapur, Woodrow.—Distrib. Throughout India; Ceylon, Malay Islands, China.

2. Monochoria vaginalis, Presl, Reliq. Hank. v. 1 (1830) p. 128. Rootstock short, suberect, spongy. Leaves very variable, 2-4 by $1\frac{1}{4}$ -2 in., from linear to ovate or ovate-cordate, usually acuminate; petioles of the lower leaves long, stout, terete, the peduncles emerging from the channelled sheaths of the uppermost leaves. Inflorescence centripetal; flowers blue, usually spotted with red; in subspicate racemes which are globose at first, the rhachis lengthening as the flowers expand, the terminal flower opening first; pedicels short, $\frac{1}{8}$ - $\frac{1}{4}$ in. long. Perianth campanulate, 6-partite, the segments $\frac{3}{8}$ in. long, nearly equal in length, 3 of them narrowly obovate, nearly $\frac{1}{8}$ in. wide, broader than the other 3 which are linear-oblong, $\frac{1}{16}$ - $\frac{1}{12}$ in. wide. Filament of the large anther $\frac{1}{6}$ in. long, with an acute horn at one side, the filaments of the smaller anthers filiform, $\frac{1}{6}$ in. long; authers linear-oblong, the larger anther $\frac{1}{16}$ in. long, the smaller anthers $\frac{1}{16}$ in. long. Ovary $\frac{1}{16}$ in. long, ellipsoid, glandular; style $\frac{1}{8}$ in. long; stigma 3-lobed. Fruit ellipsoid, less than

½ in. long, glandular outside. Seeds ½ in. long, ellipsoid, rounded at each end, pale, with many brown ribs. Fl. B. I. v. 6, p. 363; Solms-Laub. in DC. Monog. Phan. v. 4 (1883) p. 524; Trim. Fl. Ceyl. v. 4, p. 295; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1079. Pontederia vaginalis, Burm. Fl. Ind. (1768) p. 80; Roxb. Cor. Pl. v. 2, t. 110; Grab. Cat. p. 222; Dalz. & Gibs. p. 249.—Flowers: Dec.

Rice-fields and margins of tanks common, Graham, Dalzell & Gibson. Stocks without locality in Herb. Kew.' Korkan: Yingorla, Woodrow!—Distrib. Throughout India, Ceylon, Singapore, Malay Islands, China, Japan, Tropical Africa.

ORDER CXXXIV. XYRIDACEÆ.

Erect, tufted, rush-like, scapigerous, glabrous herbs. Leaves radical. elongate, linear or subulate; sheaths short. Scape stout or slender, as long as or shorter than the leaves, terete, angled or compressed, naked. Flowers hermaphrodite, sessile in the rigid, dark brown, imbricating bracts of a terminal globose or ovoid cone-like head or spike, opening one at a time: bracts orbicular or obovate, corinceous, convex, persistent. Perianth inferior, 2-seriate. Sepals (or bracteoles) 3, deciduous, membranous, the 2 lateral small (like bracteoles), narrowly boat-shaped, arched, keeled or winged, the dorsal sepal petaloid, broader, arching over the young flowers, sometimes absent. Petals 3, clawed, obovate or spathulate, colored. Stamens 3, perfect, shorter than the corollalobes and attached near their bases; anthers sagittate, 2-celled, dorsifixed, dehiscing longitudinally; staminodes 3, alternating with the corolla-lobes or 0. Ovary superior, 1-celled or imperfectly 3-celled; placentas 3, basal and confluent or parietal; ovules numerous, orthotropous; style usually 3-fid, with long arms; stigmas capitate or dilated. Fruit a loculicidally 3-valved capsule, or with the top circumscissile. Seeds minute, oblong, strongly ribbed; embryo minute, in floury albumen. -Distrib. Genera 2, one (Xyris) found in all warm regions, the other American; species about 50.

1. XYRIS, Linn.

Characters of the Order.

1. **Kyris indica**, Linn. Sp. Pl. (1753) p. 42. An erect annual 6-20 in. high. Leaves usually shorter than, but sometimes as long as the scape, $\frac{1}{8} - \frac{3}{8}$ in. broad, spongy, linear, narrowed to an obtuse or acute tip. Scape stout, deeply grooved and acutely angled. Flowers in ellipsoid spikes $\frac{1}{2} - \frac{3}{4}$ in. long; bracts many, orbicular or cuneately obovate, usually broader than long, dark red-brown, shining, very coriaceous, with scarious margins. Flowers bright yellow, $\frac{1}{2}$ in. across. Lateral sepals narrowly boat-shaped, dorsally winged, the wing serrulate. Claw of petals as long as the sepals; limb obovate or suborbicular, crose, veined. Filaments short, broad; anthers oblong, $\frac{1}{40}$ in. long. Style, including the 3 arms, $\frac{1}{20}$ in. long, the arms about $\frac{1}{40}$ in. long; stigmas truncate. Capsules ovoid, $\frac{1}{6}$ in. long. Seeds minute, ellipsoid, very strongly ribbed. Fl. B. L. v. 6, p. 364; Grah. Cat. p. 223; Dalz. & Gibs. p. 259; Trim. Fl. Ceyl.

v. 4, p. 297; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1080; Watt, Dict. Econ. Prod. v. 6, part 4, p. 321.—Flowers: Nov.-Jan. Vern. Dadumari.

Konkan: Stocks!, Dalzell!, Graham; salt marshes in the S. Konkan, Dalzell & Gibson. S. M. Country: Londa, Woodrow.—Distrib. India (Bengal, Birma, Assam, W. Peninsula); Ceylon, Malay Islands.

The natives of Bengal esteem the plant as a certain cure for ringworm. See Watt,

Dict. Econ. Prod. l. c.

ORDER CXXXV. COMMELINACEÆ.

Herbs prostrate or erect, rarely climbing, very rarely shrubby. Leaves costate, with sheathing bases; nerves parallel. Flowers more or less irregular, hermaphrodite or by abortion polygamous, often cymose; cymes scorpioid, straight or reduced to one flower, sometimes paniculate, often enclosed in spathe-like bracts; floral bracts usually small, opposite the pedicels or obsolete, sometimes herbaceous and dichotomously imbricate. Perianth inferior, 6-partite, 2-seriate; outer segments 3, herbaceous, often persistent; inner segments 3, petaloid, free or united into a tube below, spreading above, marcescent. Stamens 6, adnate to the base of the perianth-segments, all perfect or 2 or more reduced to staminodes; filaments often bearded with jointed hairs; anthers oblong or globose, often dissimilar. Ovary 3- or 2-celled, free; ovules solitary or few, on the inner angles of the cells, orthotropous. Fruit a loculicidal capsule or indehiscent, with a thin fragile or a succulent pericarp. angled; testa smooth or rugose; albumen floury; embryo minute, remote from the hilum. - DISTRIB. Genera 25; species about 300. tropical and subtropical.

Stamens 3 perfect, 1-3 staminodes.	
Cymes enclosed in spathaceous bracts	
Cymes paniculate; bracts not spathaceous	2. Aneilema.
Stamens 6 perfect.	
Petals united below into a tube; cymes scorpioid	3. CYANOTIS.
Petals free; cymes secund, in thyrsoid panicles	4. FLOSCOPA.

1. COMMELINA, Linn.

Herbs usually slender and creeping below. Leaves with lax sheaths, petiolate or not. Flowers in usually 2-fid scorpioid cymes emerging singly from a terminal complicate, or funnel-shaped, or hooded spathe; flowers of the upper cyme-branch small, deciduous, of the lower fertile; fruiting pedicel and capsule retracted within the spathe. Sepals 3, membranous, the 2 inner often connate below. Petals 3, longer than the sepals, two large, clawed, the third smaller, subsessile. Stamens 3 perfect, with 2-3 imperfect; anthers oblong, one usually longer than the others. Ovary 3 (rarely 2) -celled, 2 of the cells 1-2-ovalate, the third cell if present 1-ovalate or empty. Fruit a localicidal capsule hidden in the spathe by the decurving of the pedicel after flowering, the posticous cell sometimes indehiscent or obsolete, or the 2 anticous cells empty, indehiscent, and connate as a ligulate body, from which the posticous cell falls away. Seeds ellipsoid or angled; testa reticulate, pitted or rugose.—Distrib. Species about 90, tropical and subtropical.

Ovary 3-celled, the 2 anticous cells 2-ovulate, the posticous I-ovulate or obsolete. Capsule 3-celled, the 2 anticous cells loculicidally dehiscent, each usually 2-seeded, fhe posticous cell keeled, 1-seeded and deciduous, at length dehiscent; seeds free Spathes complicate, the margins free or connate at the very base only. Spathes sessile; seeds transversely grooved 1. C. subulatá. Spathes pedunculate. Seeds reticulate, cylindric; spathes sometimes cordate at the base 2. C. nudiflora. Seeds smooth, truncate at one end; spathes always rounded at the base. Branches of cyme equal; seeds appen-3. C. salicifolia. daged Branches of cyme unequal; seeds not appendaged 4. C. Hasskarlıi. Spathes turbinate; capsule always 5-seeded; seeds closely pitted 5. C. benghalensis. Capsule 3-celled; anticous cells 0-2-seeded; posticous cell not keeled, 1-seeded, indehiscent, deciduous; seed free or adnate to the cell. Stem erect; peduncle of spatho reaching 2 in. long; 6. C. hirsuta. flowers yellow, drying blue Steins diffuse, rooting at the nodes; peduncle of spatheless than it in long; flowers blue 7. C. Forskalæi. Capsulo 2-celled (rarely with a dorsal cell, which is empty or contains an imperfect seed); lateral cells 1-2seeded. Capsules constricted in the middle, bicuspidate; 8. C. clavata. seeds not appendaged Capsules not constricted in the middle, not bicuspidate; seeds appendaged at each end 9. C. attenuata. All the cells of the ovary 1-ovulate. Capsule 3-celled, subequally 3-valved; seeds free in the Spathe sessile or nearly so; capsule trigonousobovoid 10. C. obliqua. Spathe pedunculate; capsules quadrate-oblong 11. C. palcata. Oapsule 3-celled, 2-valved; seed adnate to the cell 12. C. albescens.

1. Commelina subulata, Roth, Nov. Pl. Sp. (1821) p. 23. Nearly glabrous; root fibrous; stem erect, slender, 8-16 in. high, simple or branched. Leaves 1-3 by $\frac{1}{10}-\frac{1}{5}$ in., linear, glabrous or nearly so, the sheaths reaching $\frac{1}{2}$ in. long, with glabrous or ciliate margins. Peduncles $\frac{1}{12}$ inch long, scattered, but often 2-3 together towards the apices of the branches. Spathes $\frac{1}{4}-\frac{3}{8}$ in. long, falcate, acute, pubescent, green or striate with purple, base cordate. Flowers small, orange-purple, when dry violet (C. B. Clarke). Capsules small, 5 (rarely 3) -seeded, at first 2-, but afterwards, from the dorsal valve becoming 2-partite, 3-valved. Seeds black, puberulous, slightly compressed, deeply transversely grooved. Fl. B. I. v. 6, p. 369; Clarke, in DC. Monog. Phan. v. 3, p. 148; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524.

This has been included on the authority of Woodrow (Journ. Bomb. Nat. l. c.), but, as he gives no locality, it would seem as if he had himself never found the plant.

There are in all only 3 sheets in Herb. Kew., one a wrotched fragment from Wight's

and the other two from Rottler's Herbarium. There is nothing to show that the plant is indigenous to Bombay. The habitat (Peninsular India) embraces a very wide area. —DISTRIB. Tropical Africa, Abyssinia.

2. Commelina nudiflora, Linn. Sp. Pl. (1753) p. 41. Diffuse, nearly glabrous; root fibrous; stems 2-3 ft. long and upwards, branching from the base; branches prostrate or subscandent, often rooting at the rather distant nodes, the tips ascending. Leaves sessile, 13-3 by 3-3 in., lanceolate or ovate-lauceolate, acute or acuminate, glabrous or puberulous, the sheaths sometimes exceeding 3 in. long, loose, glabrous, usually with ciliate margins. Peduncles $\frac{1}{2} - \frac{5}{8}$ in. long, spreading or erect. Spathes 3-14 in. long, ovate or ovate-lanceolate, acute or acuminate, base rounded or cordate with rounded lobes, glabrous or pubescent. Cymes usually two, 1- to 3-flowered; flowers $\frac{1}{2} - \frac{2}{3}$ in across, the two interior petals obovate with long claws, dark blue, the exterior subsessile, orbicular, of a paler blue or nearly white, sometimes subobsolete. Ovary 3-celled, of which two cells are 2-ovulate, the third 1-ovulate. Capsules \frac{1}{5} in. long, broadly oblong, acuminate, coriaceous, 5-seeded. Seeds oblong-cylindric, tuberculate and reticulate, brown. Fl. B. I. v. 6, p. 369; Grah. Cat. p. 223; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 144; Trim. Fl. Ceyl. v. 4, p. 300; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1081; Watt, Dict. Econ. Prod. v. 2, p. 516.—Commelina communis, Walter, Fl. Carol. (1788) p. 68; Dalz. & Gibs. p. 252.— Flowers: Dec. Venn. Gandolgi.

Common everywhere in the Konkan, Deccan, and S. M. Country. — DISTRIB. Throughout India; Ceylon, Singapore, and many tropical and subtropical countries.

3. Commelina salicifolia, Roxb. Fl. Ind. v. 1 (1832) p. 172. Stems slender, decumbent, sometimes rooting, glabrous, with long internodes. Leaves 3-6 by $\frac{1}{6}-\frac{1}{2}$ in., linear-lanceolate, glabrous or nearly so; sheaths $\frac{5}{6}-1$ in. long, ciliolate. Spathes 1-2 in. long, ovate-lanceolate, axillary, acute or acuminate, glabrous, base rounded; peduncles $\frac{1}{2}-1\frac{1}{4}$ in. long, slender. Flowers small, polygamous; branches of the cyme equal, usually 1-2-flowered. Sepals free, ovate, obtuse, the 2 inner connate below, larger than the outer. Petals dark blue, the 2 larger ovate with undulate margins and long claws, the smaller one broadly ovate, entire, subsessile or with a very short claw. Stamens 3 fertile; one anther large, lunate, the other two smaller, ellipsoid; staminodes 3, clavate. Capsules $\frac{1}{4}$ in. long, quadrate, membranous. Seeds black, powdered with white, smooth, ovoid or subglobose, $\frac{1}{5}$ in. long, appendaged at one end with a whitish membranous appendage. Fl. B. I. v. 6, p. 370; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 157; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1082; Watt, Dict. Econ. Prod. v. 2, p. 516.—Flowers: Oct.—Dec.

Konkan: Woodrow. S. M. Country: Belgaum, Ritchie, 751!—Distrib. India (Bengal, Assam, Birma, W. Peninsula); Java.

4. Commelina Hasskarlii, Clarke, Comm. & Cyrt. Beng. (1874) p. 13, t. 3. Stem much-branched, glabrous or pubescent, sometimes scaberulous. Leaves 1-3 by $\frac{1}{2}$ - $\frac{2}{3}$ in., narrowly lanceolate, subacute; sheaths $\frac{1}{2}$ in. long, with a broad base, ciliate. Spathes $\frac{1}{2}$ -1 in. long, axillary, scattered, ovate-lanceolate, cordate at the base with rounded

lobes, glabrous, scabrid, or hispid; peduncles ½-1 in. long. Flowers in pubescent cymes, the upper branch 2-4- the lower 1-2-flowered. Capsules ¼ in. long, quadrate, subtruncate, apiculate, membranous. Seeds ½-½ in. long, cylindric, truncate at one end, subacute or rounded at the other, without an appendage. Fl. B. I. v. 6, p. 370; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 157; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1082.—Flowers: Aug.—Nov.

Not common. Konkan: Law! Decean: Cooke!; Poona, Woodrow.—Distrib, India (Upper Gangetic Plain, Bengal, Assam, Malwa, W. Peninsula).

5. Commelina benghalensis, Linn. Sp. Pt. (1753) p. 41. Stem 2-3 ft. long, slender, dichotomously branched from the base upwards: branches diffuse, glabrous or pubescent, creeping and rooting below, Leaves 1-3 by $\frac{1}{2}$ - $\frac{1}{2}$ in., ovate or oblong, obtuse, sessile or shortly petiolate, pubescent or villous on both surfaces, base unequal-sided. rounded, cuneate or cordate; nerves 7-11 pairs; sheaths short or long, pubescent or villous, the margins ciliate or sometimes bearded with rufous hairs. Spathes 1-3 together, funnel-shaped or turbinate, auricled on one side, pubescent or hirsute; peduncles very short or 0. Upper branch of cyme 2-3-flowered; the lower 1-2-flowered, not uncommonly depauperate or obsolete. Sepals small, oblong, pubescent. Petals blue; larger petals orbicular or transversely oblong. Anthers oblong. Ovary 3-celled, 2 cells 2-ovulate, 1 cell 1-ovulate. Capsules 4 in. long, pyriform, membranous, 5-seeded. Seeds oblong, closely pitted. Fl. B. I. v. 6, p. 370; Grah. Cat. p. 223; Dalz. & Gibs. p. 253; Wight, Icon. t. 2065; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 159; Trim. Fl. Ceyl. v. 4, p. 301; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1082; Watt, Dict. Econ. Prod. v. 2, p. 515 .-Flowers: Aug.-Dec.

Korran: Bombay, Stocks!, Dalzell! Decean: Cooke!; Decean hills, Stocks!; Poona, Woodrow. S. M. Country: Belgaum, Ritchie, 752! Gujarat: Baroda, Woodrow.

From the lower nodes sometimes leasess underground branches proceed, bearing much depauperated scapes containing flowers white in color and smaller than the blue flowers produced in light. These flowers mature abnormal papery, 1–2-celled, 1–2-seeded capsules with abundance of usually abnormal unequal, large seeds, which ripen underground and are perfect, whereas perfect seeds are often wanting in the abrill flowers. — Distrib. Throughout India; Ceylon, China, Tropical Asia and Africa.

6. Commelina hirsuta, Clarke, in DC. Monog. Phan. v. 3 (1881) p. 163 (not of Br.). A low usually hirsute herb; stems erect, branched from the base, 6-12 in. long. Leaves 2-3½ by ½-½ in., linear-lanceolate, obtuse, acute, or acuminate, more or less hirsute on both surfaces: sheaths ½-½ in. long, villous, striate. Spathes ½-1¼ in. long, acuminate, hirsute or villous, ciliate, base cordate; peduncles ½-2 in. long, hirsute. Flowers yellow, drying deep blue (C. B. Clarke). Sepals small, ovate, obtuse, speckled with brown spots. Petals 3, the two larger orbicular with crentlate margins and a long claw, the smaller petal almost as large as the others, sessile. Stamens 3 fertile; filaments long, slender, spirally twisted; staminodes 2. Ovary hairy; style long, filiform; stigma simple. Capsules ½ in. long, with the lateral cells empty; lateral valves linear; dorsal cllipsoid, subrugose. Seed ellipsoid. Fl. B. I. v. 6,

p. 371; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524. Heterocarpus hirsutus, Wight, Icon. v. 6 (1853) p. 29, t. 2067.—Flowers: Aug.—Oct.

Belgaum, Ritchie, 751!

There is in Herb. Kow. but one specimen of the plant from the Bombay Presidency named by Mr. Clarke, and collected by Dr. Ritchie at Belgaum.—DISTRIB. India (W. Peninsula).

7. Commelina Forskalæi, Vahl, Enum. v. 2 (1806) p. 172. Stems long, branched, slender, diffuse, rooting at the nodes. Leaves 1-2 by $\frac{1}{4}$ -in., glabrous or puberulous, narrowly oblong, obtuse or subacute, narrowed at the base, the margins usually undulate or crenulate; sheaths 1-2 in. long, finely striate, pubescent, ciliate. Spathes 1 in. long and about 3 in. wide, broadly ovate, complicate or hooded, acute, sparsely hairy with long slender hairs, finely striate, base usually truncate or sometimes cuneate; peduncles $\frac{1}{4} - \frac{3}{8}$ in. long. Upper cyme-branch 1-3-Petals blue, the 2 larger obovate, with a very long slender Filaments very long, spirally coiled. Lateral cells of capsule either both empty or one or both containing an orange-brown seed; dorsal cell of capsule 1 in. long, oblong, somewhat laterally compressed, rounded at both ends, slightly ribbed, containing I large seed which quite fills the cell. Seeds without appendages, orange-brown; those of the lateral cells subglobose and irregularly angled when only one cell contains a seed, orbicular in outline, subdiscoid, compressed, when both cells are seed-bearing; the seed of the dorsal capsule 1 in. long, oblong, rounded at both ends. Fl. B. I. v. 6, p. 371; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 168; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524.— Flowers: Nov.

DECCAN: Poonn, Cooke!, Woodrow!, Jacquemont, 360!—Distrib. India (W. Peninsula); Tropical Africa.

Leafless suckers bear capsules that ripen underground as in C. benghalensis.

8. Commelina clavata, Clarke, Comm. & Cyrt. Beng. (1874) p. 15, t. 5. Stem 1-3 ft. long, sparingly branched; branches diffuse, as thick as a crow-quill, rooting at the nodes. Leaves $1\frac{1}{2}-3$ by $\frac{1}{4}-\frac{3}{4}$ in., ovate or elliptic-lanceolate, or linear-lanceolate, acuminate, glabrous, puberulous or pubescent on one or both surfaces, narrowed at the base; sheaths 1-1 in. long, narrowed into the blade, glabrous or pubescent, ribbed, sometimes speckled with brown, usually hirsute at the mouth. Spathes 3-11 in. long, ovate-lanceolate, acuminate, glabrous or pubescent, base rounded or cordate; peduncles $\frac{3}{4}$ - $1\frac{3}{4}$ in. long. Sepals spotted with small brown linear spots. Capsules when perfect 3 by 1 in., quadrateoblong, truncately rounded at the ends, the tip bicuspidate, slightly constricted in the middle, with 4 seeds; sometimes the 2 upper ovules alone produce seed, and the capsule is then constricted at the base, as if stalked. Seeds 4 (the two lower sometimes wanting), in. long, cylindric, truncate at one end, rounded at the other, reticulately pitted. Fl. B. I. v. 6, p. 371; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 171, t. 2, fig. 2; Trim. Fl. Ceyl. v. 4, p. 301; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524.

Rare. Konhan: Matheran, Woodrow. S. M. Country: Talbot!; Badami, Woodrow. —Distrib. India (W. Peninsula); Ceylon, Java.

9. Commelina attenuata, Koen. ex Vahl, Enum. v. 2 (1806) p. 168. Stem 1-3 ft. long, slender, much-branched, glabrous or sparsely hairy. Leaves sessile, 1\frac{1}{4}-3 by \frac{1}{6}-\frac{1}{2} in., linear or linear-lanceolate, acute or subobtuse; sheaths about \frac{1}{4}-\frac{3}{6} in. long, ciliate, often scarcely distinct from the leaf-blade. Spathes 1-1\frac{1}{2} in. long, narrowly ovate-lanceolate, acute or caudate-acuminate, glabrous, base deeply sagittately cordate, with large auricles; peduncles \frac{3}{6}-1\frac{1}{2} in. long, glabrous or pubescent. Flowers small, blue. Ovary 2-celled, the cells 2-ovulate. Capsules \frac{1}{4} in. long, subquadrate-oblong, compressed, membranous, not constricted in the middle, 2-celled, the cells 1-2-seeded. Seeds when solitary large, \frac{3}{6} in. long; testa ash-colored or straw-colored with a white appendage at either end; when 2 seeds are superposed in a cell, the lower seed is much smaller. Fl. B. I. v. 6, p. 372; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 172; Trim. Fl. Ceyl. v. 4, p. 303; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1082. Commelina rajmahalensis, Clarke, in Journ. Linn. Soc. v. 11 (1870) p. 444, & Comm. & Cyrt. Beng. (1874) p. 17, t. 7.

I have seen no Bombay specimens, the specimen from Badami cited by Woodrow in his list having proved to be C. clavata.

10. Commelina obliqua, Buch.-Ham. in Don, Prodr. Fl. Nep. (1825) p. 45 (not of Vahl). Stem 2-3 ft. high, stout, branched, glabrous. Leaves 4-7 by 1-2 in., sessile or petiolate, lanceolate or elliptic-lanceolate, acute or caudate-acuminate, membranous, glabrous, scabrous or villous; sheaths reaching 1 in. long, the month bearded with long hairs. Spathes sessile or nearly so, 3-1 in. long and as broad as long, solitary or crowded in terminal heads, acute, turbinately funnel-shaped, glabrous or subscabrid, usually filled with a clear glutinous liquid. Flowers blue, about 3 in. across, in simple (not branched) racemes; large petals clawed, orbicular. Ovary 3-celled, the cells 1-ovulate. Capsules 2 in. long, trigonous-obovoid, subequally 3-valved, 3-celled, 3-seeded. Seeds 1 in. long, oblong or ellipsoid, smooth, puberulous, lead-colored. Fl. B. I. v. 6, p. 372; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 178; Trim. Fl. Ceyl. v. 4, p. 303; Woodr. in Journ. Bomb. Nat. v. 12(1899) p. 524; Prain, Beng. Pl. p. 1082; Watt, Dict. Econ. Prod. v. 2, p. 516. Commelina polyspatha, Wight, Icon. v. 6 (1853) p. 29, t. 2066.

KONKAN: Stocks!, Law!; Bassein, Raeji! DECCAN: Purandhar, Woodrow.—DISTRIB. Throughout India; Ceylon, Malay Islands.

11. Commelina paleata, Hassk. in Miq. Pl. Jungh. (1851-55) p. 139. Stem stout, branched, glabrous. Leaves 2-6 by 1-1\frac{3}{4} in., elliptic or broadly lanceolate, acuminate, glabrous or nearly so, base usually cureate; sheaths \frac{3}{4}-1 in. long. Spathes \frac{3}{4}-1\frac{1}{4} in. long, shortly cucultate, ovate, acute or acuminate, with a broad rhomboid base, scabridly pubescent; peduncles \frac{3}{6}-\frac{5}{16} in. long. Flowers blue; lower cyme-branch 1-2-flowered, upper 4-flowered. Capsules \frac{1}{4} in. long, quadrate-oblong, 3-celled, 3-valved. Seeds 3, subequal, \frac{1}{6} in. long, ellipsoid, rounded at both ends, dull black, nearly smooth, scarcely compressed. Fl. B. I. v. 6, p. 372; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 178; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524.

KONRAN: Stocks!; North and South Konkan, Law!—Distrib. India (W. Peninsula); Java.

12. Commelina albescens, Hassk. in Schweinf. Beitr. Fl. Æthiop. (1867) p. 210. Root-fibres thick; stems thickened at the base, often 2 or more from the root, clothed below with many white membranous sheaths, glabrous. Leaves 2-3 by $\frac{1}{4}-\frac{1}{2}$ in., linear or linear-lanceolate, acute, glabrous, the margins often undulate. Spathes $\frac{1}{2}-\frac{\pi}{4}$ in. long and sometimes nearly as broad as long, 1-3 together, subsessile, glabrous or nearly so, finely striate, cucullate, falcately hooked at one end, auricled at the other. Flowers blue, the lower raceme obsolete, the upper 3-5-flowered. Capsules $\frac{1}{6}$ in, long, 3-celled, 2-valved, the dorsal cell indehiscent, with muricate ribs. Seeds $\frac{1}{10}-\frac{1}{8}$ in, long, rounded at the ends and on the back, somewhat angular on the inner face, dull black. Fl. B. I. v. 6, p. 373; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 184; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524.

In the Bombay Presidency confined to Sind. Sind: Dalzell!, Stocks!, Cooke!, Woodrow.—Distrin. Beluchistan, Arabia, Tropical Africa.

I have not found that the seeds are spotted with yellow as noted by Mr. Clarke, though I have examined a considerable number.

DOUBTFUL AND INDETERMINABLE SPECIES.

COMMELINA AVENEFOLIA, Grah. Cat. Pl. Bo. (1839) p. 224. Leaves sprinkled with hairs; sheaths hairy; involuere truncate. In the dense part of the jungle at Khandala (Deceau), Graham.

There are no data for the determination of this plant, of which the description is

very meagre.

2. ANEILEMA, R. Br.

Simple or branched erect or decumbent herbs; roots usually fibrous (sometimes tuberous). Leaves usually alternate, sometimes all radical, occasionally clustered under the inflorescence, usually narrow and sessile (rarely broad and petiolate). Flowers in axillary and terminal panicles, bracteate and bracteolate; bracts not spathaceous. Sepals 3, membranous, free. Petals 3, obovate, equal. Stamens 2 or 3 with perfect anthers and 2-4 (rarely 0) reduced to staminodes with imperfect anthers; filaments slender, bearded or not. Ovary sessile, 2-3-celled; cells 1-many-ovulate; style slender, naked or bearded; stigma minute. Fruit a loculicidal capsule. Seeds 1 or more in each cell, with a thick hard rugose or pitted testa.—Distrib. Species about 60, tropical and subtropical, chiefly Asiatic.

Cells of the ovary 2-\(\pi\)-ovulate; seeds 1-seriate in each cell.
Cells of the ovary 3-\(\pi\)-ovulate; cells of the capsule 1-3-or
more-seeded. (See also \(A\), nudiflorum.)
Flowers in panicles terminating an erect leafless scape

with large sheathing bracts; leaves all radical
Flowers in panicles terminating leafy stems.

Root of stender tubers; leaves reaching 12 in. long; filaments all bearded

Root fibrous; leaves less than 3 in. long; filaments of fertile stamens bearded, of the sterile usually naked.

A procumbent herb; stem less than 1 ft. long; filaments of sterile stamens sometimes bearded. An erect herb 1 ft. high; filaments of sterile stamens never bearded

1. A. scapiflorum.

2. A. herbaceum.

3. A. spiratum.

4. A. dimorphum.

3 F

Flowers in axillary 1-3-flowered cymes. Flowers blue; filaments all maked 5. A. pauciflorum. Flowers ochre-yellow; filaments all bearded 6. A. versicolor. Cells of the ovary 2-ovulate; cells of the capsule 2-seeded (rometimes 3-seeded in A. nudiflorum var. compressa). Leaves 2-5 in. long; root fibrous 7. A. nudiflorum. Leaves reaching 12 in, or more long; root tuberous or fibrous. Root tuberous: fertile stamens 2 with 3 staminodes and 1 rudimentary antherless stamen; filaments of the 3 staminodes naked 8. A. sinicum. Root fibrous; fertile stamens 3; staminodes 3; rudimentary stamen 0; filaments of all equal and bearded 9. A. giganteum. Cells of the ovary 4-20-ovulate, seeds 2-seriate in each cell. Flowers axillary, solitary or clustered; pedicels jointed in the middle; flowers yellow. Stem not exceeding 8 in. long; leaves less than 1 in. long; filaments naked 10. A. ochraceum. Stem reaching 16 in. long; leaves exceeding 1 in. long; filaments bearded 11, A. lanuginosum. Flowers in paniculate cymes, blue; leaves grass-like 12. A. paniculatum. Cells of the ovary 1-ovulate; cells of the capsule 1-sceded or ompty 13. A. vaginatum.

1. Aneilema scapiflorum, Wight, Icon. v. 6 (1853) p. 30, t. 2073. A tufted herb; root of elongate pisiform tubers. Leaves all radical, erect, 4-8 by $\frac{3}{8}$ $\frac{5}{8}$ in., narrowly ensiform, finely acuminate, glabrous or nearly so, slightly narrowed at the base. Flowers in erect elongate panicles on terminal leafless scapes; scape together with the panicle 8-18 in. long; sheaths on the scape below the panicle 3-21 in. long. embracing the scape, fively acuminate with an oblique mouth; upper bracts amplexicaul, ovate, acuminate or truncate, membranous, often spotted with small spots. Sepals 1 in. long, elliptic-oblong, subacute, 3-5-nerved, purple-green. Petals blue, 3 in. long, obovate, reticulately voined. Stamens 3 perfect and 3 staminodes; filaments all bearded with blue hairs; anthers of fertile stamens blue, those of the staminodes yellow. Capsules & in. long, obovoid. Seeds 5 or 6 in a cell, superposed, 16 in. in diam., sharply 3-gonous. Fl. B. I. v. 6, p. 375; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 200; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1083; Watt, Dict. Econ. Prod. v. 1, p. 252. Aneilema tuberosum, Buch.-Ham. in Wall. Cat. (1828) 5207; Dalz. & Gibs. p. 255.—Flowers: May-June.

Not common. S. M. Country: Ritchie, 748! Kanara: Kála naddi, Ritchie, 748!—Distair. India (temperate and tropical Himalaya; Bhotan, Tirhut, W. Peninsula); Ceylon.

2. Aneilema herbaceum, Wall. Cat. (1828) 5223. Erect, robust, 3-4 ft. high, glabrous or nearly so; root of slender linear-oblong tubers; stem stout, round, smooth, leafy. Leaves sessile, the lower sometimes reaching 12 by 2 in., the cauline leaves 4-6 by 1\frac{1}{2}-1\frac{1}{2} in., all narrowly oblong or ensiform, acuminate, smooth with white undulate margins, base cuneate, rounded or cordate; sheaths entire. Flowers in stout glabrous dichotomously branched panicles, the branches distant and few-lowered; bracts small, soon falling. Sepals \(\frac{1}{4}\) in. long, elliptic-oblong, concave, persistent on the fruit, marked with short brown lines, 3-nerved.

Petals blue, obovate or suborbicular. Stamens 3 (sometimes only 2) perfect; staminodes 3 or 4; filaments of all bearded. Capsules ellipsoid or subglobose, 4 in. in diam., with a bluish tinge, smooth, glistening, mucronate. Seeds 3-4 (rarely 5) in each cell, 1-seriate, 1_0 in. in diam., 3-gonous, reticulate, glandular-puberulous. Clarke, in DC. Monog. Phan. v. 3 (1881) p. 204; Jackson, Index Kewen. v. 1, p. 130. Ancilema lincolatum, Kunth, Enum. v. 4 (1843) p. 69; Clarke, Comm. & Cyrt. Beng. p. 27, t. 15; Hook. f. Fl. B. I. v. 6 (1892) p. 376; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524; Prain, Beng. Pl. p. 1084. A. elatum, Kunth, Enum. v. 4 (1843) p. 70; Dalz. in Kew Journ. Bot. v. 3 (1851) p. 137; Dalz. & Gibs. p. 254. A. latifolium, Wight, Icon. v. 6 (1853) p. 30, t. 2072.—Flowers: Aug.—Sept.

Konkan: Stocks!, Law!; dark woods of the S. Konkan, Dalzell & Gibson; Wari country, Dalzell! S. M. Country: Ramgbat, Ritchie, 1459!—Distrib. India (Sikhim, Bhotan, Khasia Hills, Birma, W. Peninsula); Malay Islands.

3. Aneilema spiratum, R. Br. Prodr. (1810) p. 271 (in adnot.). A dwarf annual, branched from the base; root fibrous; branches 6-10 in. long (often less), decumbent and rooting below, leafly. sessile, the lower broadly linear-lanceolate, the upper oblong, cordate, all amplexicaul, glabrous, $\frac{1}{2}-1\frac{1}{2}$ by $\frac{1}{3}-\frac{1}{2}$ in., acute, canaliculate in the middle; sheaths very short. Flowers about 1 in. across, in dichotomously branched, few-flowered panicles; peduncles terminal and from the upper axils, solitary or twin; pedicels rather long, longer than the fruit, bifarious, distant; bracts minute, ovate, amplexicaul, persistent. Sepals spreading. Petals blue, broadly oblong, obtuse. Stamens 3 perfect, the anthers apiculate, blue, the filaments bearded; staminodes 3, shorter than the stamens, the filaments usually naked but occasionally bearded. Ovary 3-celled; cells 3-many-ovulate. Capsules 10-1 in. long, oblong, mucronate, smooth, shining, 3-gonous, the cells 3-7-seeded. Seeds 1-seriate, minute, angular or cubical, white or straw-colored. Il. B. I. v. 6, p. 377; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 207; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525; Prain, Beng. Pl. p. 1084. Aneilema canaliculatum, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 137; Dalz. & Gibs. p. 254. A. nanum, Kunth, Enum. v. 4 (1843) p. 65; Wight, Icon. t. 2077 right-hand figure.-Flowers: Oct.

Konkan: Dalzell!, Stocks!, Law!; Ratnagiri, Woodrow. Deccan: Mahableshwar, Woodrow. S. M. Countay: Belgaum, Ritchie!—Distrib. Throughout India; Coylon, Malay Islands, Ohina.

4. Aneilema dimorphum, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 138. Whole plant glabrous (except the mouths of the sheaths), about 1 ft. high; root fibrous; stems many, branching from the root, the branches erect, terete, striate. Leaves $1-2\frac{1}{2}$ by $\frac{1}{3}-\frac{1}{2}$ in., linear-oblong to ovate-lanceolate, obtuse or acute, flat, base rounded or cordate; mouth of short sheath ciliate. Flowers $\frac{1}{2}$ in across, in panicles $1-\frac{1}{2}$ in long, which are sparingly dichotomously branched, few-flowered; bracts small, $\frac{1}{20}-\frac{1}{12}$ in. long, ovate or orbicular, obtuse, cucullate, persistent. Sepals ovate, obtuse, concave, reflexed. Petals blue, obovate, subacute. Stamens 3 fertile and 3 staminodes; filaments of fertile stamens bearded, those of the staminodes naked. Ovary 3-celled; cells 3-5-ovulate. Capsules $\frac{1}{3}-\frac{1}{4}$ in. long, oblong, 3-gonous, shining. Seeds

3-5, uniscriate in each cell, $\frac{1}{12}$ in. in diam., subcubical, cupped at one end, brown-black, minutely striate. Fl. B. I. v. 6, p. 377; Dalz. & Gibs. p. 254; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 206; Trim. Fl. Ceyl. v. 4, p. 307; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 524. Ancilema paniculatum, Wight, Icon. v. 6 (1853) p. 31, t. 2075 (not of Wall.).

Konkan: Stocks!, Law!, Mulwan, Dalzell! Kanara: Law!-Distrib, India (W. Peninsula); Coylon.

5. Aneilema pauciflorum, Wight, Icon. v. 6 (1853) p. 31, t. 2077 (not of Dalzell). A small decumbent plant creeping and rooting at the nodes; stem villous on one side. Leaves \(\frac{1}{2}-\frac{1}{4}\) by \(\frac{3}{6}-\frac{5}{8}\) in., sessile, ovate, subacute, more or less hairy on both sides, base rounded or cordate; sheaths with ciliate margins. Flowers blue (?); pedicels axillary, solitary, or the upper 1-3-nate, \(\frac{1}{4}-\frac{3}{8}\) in. long. Sepals narrowly oblong, thickened at the tips. Petals obovate. Stamens 3 fertile and 3 sterile, the filaments of the latter only half as long as those of the former; filaments of both stamens and staminodes naked. Capsules \(\frac{1}{4}\) by \(\frac{1}{16}\) in., oblong-fusiform, acute, somewhat 3-gonous, smooth, 3-celled. Seeds 4-6 in each cell, 1-seriate, superposed, cubical, nearly smooth, black. Fl. B. I. v. 6, p. 378; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 207; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525.

KONKAN: Matheran, Woodrow. Deccan: Mahableshwar, Woodrow.—Distrib. India (W. Peninsula), apparently endemic.

There is but one sheet in Herb. Kew. (Wight's original example) from near Coimbatore in the Madras Presidency. Woodrow gives the plant for Matheran and Mahableshwar.

6. Aneilema versicolor, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 136. A small herb with weak subcrect branches; root fibrous; stems 4-8 in. long, many from the root, deeply striate, glabrous or hispid. Leaves alternate, bifarious, 1-2 by $\frac{3}{3}-\frac{1}{2}$ in., flat, oblong-lanceolate, acuminate, smooth, stem-clasping, 5-7-nerved; sheaths rather long, furrowed, more or less hispid. Flowers ochre-yellow, bluish when withering, rose-colored in bud (Dalzell); pedicels axillary, filiform, jointed about the middle, solitary or the upper 1-3-nate. Sepals oblong, obtuse, concave. Petals ochre-yellow. Stamens 3 fertile, spreading; filaments subulate, bearded in the lower part. Staminodes 3, shorter than the fertile stamens; filaments sparingly bearded. Capsulcs 1 in. long, scarcely longer than the persistent sepals, linear, subtrigonous, pointed, erect; cells 5-7-seeded. Seeds cubical, about \(\frac{1}{80} \) in. long. Fl. B. I. v. 6, p. 378; Dalz. & Gibs. p. 253; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 208; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525.

Konkan: Malwan, Dalzell & Gibson. Diccan: Mahableshwar, Coole! S. M. Country: Ritchie, 749!—Distrib. India (W. Peninsula).

7. Aneilema nudiflorum, R. Br. Prodr. (1810) p. 271 (in adnot.). Root fibrous; stem subsimple or branched from the base; branches 6-12 in. long, weak, procumbent, often rooting at the nodes. Leaves 2-5 by \(\frac{1}{2}\) in., linear-oblong or lanceolate, acute or acuminate, flat, glabrous, hairy or sparingly villous, base rounded, cordate, or narrowed into the sheath; sheaths hairy, the margins and mouth strongly ciliate. Flowers

in terminal (rarely axillary) panicles; branches of panicles long, scarred above; flowers in subglobose or subcorymbose cymes at the ends of the branches; pedicels $\frac{1}{8} - \frac{1}{9}$ in. long; bracts $\frac{1}{6}$ in. long, cymbiform, caducous. Sepals $\frac{1}{5}$ by $\frac{1}{20}$ in., oblong, obtuse. Petals suborbicular, blue or purple. Stamens 2 perfect, 2-4 sterile; filaments of the fertile only or of all bearded. Ovary 3-celled; cells 2-ovulate; style naked. Capsule $\frac{1}{3}$ in. long, 3-gonously subglobose, membranous, mucronate, smooth, 3-celled, with 2 seeds in each cell. Seeds $\frac{1}{10}$ in. long, truncate at one end, rounded at the other, angular on the inner, rounded on the outer face, tuberculate, dark brown. Fl. B. I. v. 6, p. 378; Dalz. & Gibs. p. 253; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 210; Trim. Fl. Ceyl. v. 4, p. 308; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525; Prain, Beng. Pl. p. 1084. Commelina nudiflora, Linn. Mantiss. p. 177 (not of Sp. Pl.); Grah. Cat. p. 223.—Flowers: Sept.

Throughout the Presidency tolerably common. GUJARAT: Domas near Surat, Cooke!; Godra, Cooke!, Woodrow.—Distrib. Throughout India; Ceylon, China, Malay Islands.

VAR. compressa, Clarke, in DC. Monog. Phan. v. 3 (1881) p. 211. Leaves shorter, more fleshy; petals rose-colored; ovary often with 3 ovules in each cell; capsules often with 3 seeds in each cell. Fl. B. I. v. 6, p. 379. Ancilema compressum (sp.), Dalz. in Kew Journ. Bot. v. 3 (1851) p. 138; Dalz. & Gibs. p. 253.

Konkan: Malwan, Dalzell!

8. Aneilema sinicum, Lindl. Bot. Reg. (1822) t. 659. Root of elongate tubers; stems 1-2 ft. high, suberect, glabrous, with long internodes. Leaves 6-12 by $\frac{1}{2}$ - $\frac{2}{3}$ in., linear, acute, cauline and tufted at the base of the stem, glabrous or nearly so; sheaths long, ciliate. Flowers in terminal lax panicles; branches of the panicle closely scarred above; bracts & in. long, ovate, acute, membranous, caducous; pedicels Sepals ovate, acute, concave. Petals exceeding the $0-\frac{1}{2}$ in. long. sepals, obovate or suborbicular, blue. Stamens 2 fertile, twice as long as the staminodes, with bearded filaments; 1 rudimentary stamen consisting of a bearded filament with an acute antherless apex and 3 sterile stamens, the filaments of which are naked. Ovary with 2 ovules in each cell. Capsules subglobose, 1 in. in diam., 3-celled, each cell 1-2-seeded. Seeds 1 in. long, obscurely rugose. Fl. B. I. v. 6, p. 379; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 212; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525. Ancilema secundum, Wight, Icon. v. 6 (1853) p. 31, t. 2075.

Konkan: Stocks! Deccan: Mahableshwar, Cooke!; Wada, Woodrow,—Distrib. India (W. Peninsula); Africa, China, Malay Islands.

9. Aneilema giganteum, R. Br. Prodr. (1810) p. 271. Root fibrous, the fibres thick but scarcely tuberous; stem $1-3\frac{1}{2}$ ft. high, erect, glabrous or nearly so, with long internodes. Leaves: the lowest 10-18, the upper 2-5 in. long, $\frac{1}{3}-\frac{1}{2}$ in. broad, linear, finely acuminate, flat, striate, narrowed into a short or long sheath. Flowers $\frac{1}{2}$ in. across in terminal (rarely axillary) panicles; primary branches 3-4, umbellate, each again branched, the ultimate branches deeply, closely (almost pectinately) scarred; bracts at the axils of the branches of the panicle large, broadly ovate, cordate, acute; bracteoles $\frac{1}{6}-\frac{1}{4}$ in. long, orbicular,

concave, caducous; pedicels \(\frac{1}{8} - \frac{1}{4} \) in. long. Scholar (1) and e, concave. Petals pale purplish-blue, ohorate or (1) and 3 sterile; filaments of all equal and bearded. Ovary 3-celled; cells 2-ovulate; style naked. Capsules \(\frac{1}{8} \) in. long, oblong-ellipsoid, mucronate, the cells 2-seeded; valves hard, polished. Seeds irregularly shaped, rough or echinulate, brown. Fl. B. I. v. 6, p. 379; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 212; Trim. Fl. Ceyl. v. 4, p. 308. Ancilema confolium, Wight, Icon. v. 6 (1853) p. 30, t. 2074.

Konkan: Stockel, Law! Decean: Malableshwar, Cooke!—Distrib. India (Assam, Khasia Hills, W. Pemusula), Ceylon, Malay Islands, China, Australia, Africa.

10. Aneilema ochraceum, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 135. Stem 4-8 in. long, rooting at the lower nodes, erect, simple, round, smooth, leafy. Leaves sessile, \(\frac{1}{4}-1\frac{1}{2}\) by \(\frac{1}{4}-\frac{1}{2}\) in., flat, oblong or ovate-oblong, acute or subobtuse, glabrous or nearly so, base condate, subamplexicaul. Pedicels fascicled, 2-7 from a leaf-axil, \(\frac{1}{4}-\frac{3}{4}\) in. long, slender, minutely hispid, anticulate about the middle. Sepals elliptic, obtuse, glabrous. Petals ochre-yellow, when withering blue, obovate. Stamens 3 fertile and 3 sterile; filaments of the fertile longer than those of the sterile ones, all naked. Capsules \(\frac{1}{6}-\frac{1}{6}\) in. long, broadly oblong, obtuse, mucronate. Seeds 7-8 in each cell in 2 rows, straw-colored, angular, rugose. Fl. B. I. v. 6, p. 380; Dalz. & Gibs. p. 253; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 214, t. 4, fig. 3; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525. Dichaspermum repens, Wight, Icon. v. 6 (1853) p. 31, t. 2078, fig. 3 (not of Hassk.).

Konran: Stocks!, Law!, Woodrow; wet places in the S. Konkan, Dalzell & Gibson. Kanaha: Law!, Dalzell!—Distrib. India (W. Peninsula).

11. Aneilema lanuginosum, Wall. Cat. (1828) 5221. Root of thickened fibres, almost tuberous; stem erect, pubescent, or villous, or nearly glabrous, 6-16 in. long, stout, branched. Leaves sessile, 1½-2½ by ¼-½ in., linear or linear-lanceolate with a broad base, finely acuminate, pubescent on both sides, conspicuously striate and with undulate margins. Flowers from the upper leaf-sheaths, 1-5 from each sheath; pedicels ½-2 in. long, erect in truit, jointed in the middle and there iurnished with a minute ovate scarious bracteole. Sepals ¼ by ½ in., elliptic, obtuse, straw-colored. Petals ¾ in. long, broadly obovate or suborbicular, salmon-colored, turning blue in drying (Gamble). Filaments densely bearded. Capsules nearly ⅓ in. long, oblong, trigonous, shining, long-cuspidate with the style. Seeds angular, smooth, sometimes slightly pitted. Fl. B. I. v. 6, p. 380; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 214; Woodr. in Journ. Bomb. Nat. v. 12 (1809) p. 525.—Flowers: Sept.—Oct.

KONKAN: Stocks!, Law! Diccan: Mahableshwar, Woodrow. S. M. Country: Belgaum, Rutchie, 1474!—Distrib. India (W. Poninsula), apparently endemic.

12. Aneilema paniculatum, Wall. Cat. (1828) 5216. A small plant $2\frac{1}{2}$ -8 in. high; root fibrous; stem sheathed at the base with yellowish scarious sheaths. Leaves 2-4 by $\frac{1}{20}$ - $\frac{1}{10}$ in., linear, finely acuminate. Flowers in paniculate cymes; bracts ochreate, $\frac{1}{20}$ - $\frac{1}{10}$ in. long, cyathiform, truncate, with a tooth at the apex, persistent; pedicels $\frac{1}{5}$ - $\frac{3}{8}$ in. long, filiform, red (Dalzell). Sepals $\frac{1}{10}$ - $\frac{1}{8}$ by $\frac{1}{10}$ in., elliptic, obtuse, glabrous. Petals $\frac{1}{8}$ - $\frac{1}{9}$ in. long, obovate, cuncate, veined,

blue. Stamens 3 fertile and 3 sterile; filaments all connate at the very base, naked. Ovary ovoid; style $\frac{1}{1_K}$ in. long. Capsules $\frac{1}{1_0} - \frac{1}{8}$ in. long, ellipsoid or subglobose, smooth, shining. Seeds 6-8 in each cell, pale yellow, 2-seriate, irregularly angular, smooth. Fl. B. I. v. 6, p. 381; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 215; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525. Aneilema semiteres, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 138; Dalz. & Gibs. p. 254. Dichaspermum juncoides, Wight, Icon. v. 6 (1853) p. 31, t. 2078. Commelina Nimmoniana, Grah. Cat. Pl. Bo. (1839) p. 224.—Flowers: Aug.

Konkan: Dalzell!, Law!; Malabar Hill (Bombay), Graham; Narel below Matheran, Kanitkar! Decean: Mawal near Poona, Woodrow; between Poona and Karli, Jacquemont, 561! Kanara: Karwar, Woodrow.—Distrib. India (W. Peninsula) in rocky places.

13. Aneilema vaginatum, R. Br. Prod. (1810) p. 271 (in adnot.). Root fibrous, the fibres stout, almost fleshy; stem 6-18 in. long, very slender, flaccid, rooting at the lower nodes; branches suberect, ending in filiform peduncles with distant flowering bracts. Leaves 3-8 by $\frac{1}{4}$ - $\frac{3}{8}$ in., linear, acuminate, flat, glabrous or sparsely hairy; sheaths short, open, ciliate. Flowers small, 1-3 together, fascicled in distant bracts, along the filiform very slender terminations of the branches; bracts 1-1 in, long, narrowly oblong, obtuse, sheathing, strongly ribbed; pedicels 1-3 in. long, very slender, puberulous, usually twice-jointed. Sepals in. long, ovate-oblong, obtuse, glabrous or pubescent. Petals orbicular, blue. Stamens 2 perfect, 3-4 sterile; filaments of the perfect stamens bearded, those of the sterile ones usually naked, shorter than the fertile filaments. Ovary 2-celled; cells 1-ovulate. Capsules $\frac{1}{8}$ in. in diam., globose, cuspidate, shining, 3-celled; cells 1-seeded or empty. Seeds 3-gonously conic, one end abruptly truncate, the other narrowed, obtuse, slightly rugose, black. Fl. B. I. v. 6, p. 381; Wight, Icon. t. 2076; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 216; Trim. Fl. Ceyl. v. 4, p. 309; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525; Prain, Beng. Pl. p. 1084. Aneilema pauciflorum, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 136; Dalz. & Gibs. p. 253.—Flowers: Aug.

A very distinct species. The panicle is reduced to a long filiform

rhachis with very distant bracteate clusters of flowers.

KONKAN: Dalzell!, Stocks!, Law!; Matheran, Woodrow. KANARA: Law!—Distrib. Throughout tropical India in rice-fields and wet places; Ceylon, China.

EXCLUDED SPECIES.

ANEILEMA KOENIGII, Wall. Cat. (1828) 5214. This does not appear to be a Bombay plant. Woodrow includes it in his list of plants without locality. According to the 'Flora of British India' it occurs in S. India to the south of the Konkan and Kanara. I have seen no specimens from Bombay; there are none in Herb. Kew., and the plant does not seem to have been found by any Bombay botanists.

3. CYANOTIS, Don.

Herbs prostrate or creeping. Leaves small. Flowers in axillary and terminal scorpioid cymes, formed of large imbricate, 2-seriate, secund, foliaceous, falcate bracteoles, the petals and stamens alone exserted (rarely the corolla-tube also exserted); sometimes the flowers in exposed

racemes or fascicled in the ochrcate leaf-sheath. Sepals 3, subequal, free or connate below. Petals 3, subequal, often united into a tube below; the limb orbicular. Stamens 6, all perfect, subequal, hypogynous or epipetalous; filaments usually bearded, often inflated towards the apex; anthers oblong. Ovary 3-celled; ovules 2 in each cell; collateral, one erect, the other pendulous. Fruit a 3-celled loculicidal capsule. Seeds usually 2 in each cell, superposed, cubical or pyramidal, usually rugose.—Distrib. Species 35, in the warm regions of the Old World, Africa, India, Malaya, Ceylon, S. China, Tropical Australia.

Cymes enclosed in 2-seriate falcate imbricating bracteoles; valves of the capsule separating from a free central columnar 3-toothed axis 1. C. papilionacca. Capsule with no free central column after dehiscence. Root of fusiform narrow tubers; a large coarse species. 2. 'C, tuberosa', Root fibrous. A floccosely silky or cobwebby woolly herb; filaments bearded with hairs of 2 colors; leaves 2-2 in. long; seeds oblong, faintly rugose 3. C. fasciculata. Not floccosely silky nor cobwebby; filaments bearded with hairs of one color. Leaves 11-24 in. long, ovate-oblong with rounded or cordate bases; seeds 3-gonous, striate, with 2 large pits on 2 of the faces 4. C. cristata. Leaves 6-18 in. long, narrowed from the base to the tip; seeds truncate at the base, slightly 5. C. Wightit. tapering upwards, with shortly conical apex... Bracteoles small, not imbricating in 2 series. Epiphytic viviparous herb; flowers in small umbels terminating short lateral peduncles from a long scape...... 6. C. vivipara. Terrestrial not viviparous herb; flowers axillary, enclosed in the sheaths of the leaves 7. C. axillaris.

1. Cyanotis papilionacea, Schultes f. Syst. v. 7 (1830) p. 1151. A hispid annual 4-8 in. high, sparingly branched from near the base, the branches decumbent, often rooting; stem red, terete, striate, patently pilose. Leaves sessile, linear-oblong or lanceolate, 1-2 by 3in., acute, acuminate, or obtuse and apiculate, more or less hairy above, patently hairy beneath, the upper leaves longer than the lower; sheaths very short. Peduneles slender, 1-2 in. long, patently hairy; bract ovate-lanceolate, falcately recurved, often longer than the spike; bracteoles in long, 2-seriate, ovate, falcate, acute, ciliate. Sepals lanceolate, acute, ciliate. Corolla-tube whitish, longer than the lobes; lobes bluish-purple, rounded. Stamens much exserted, twice as long as the corolla, equalling the style; anthers violet; filaments slightly thickened at the tip, bearded above with blue hairs. Ovary hairy; style naked. Capsules included, oblong, $\frac{a}{4}$ by $\frac{b}{b}$ in., hairy towards the apex; valves separating from a free central columnar 3-toothed axis. Seeds smooth or pitted, 2 in each cell. Fl. B. I. v. 6, p. 384; Wight, Icon. t. 2089; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 246; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525. Cyanotis hispida, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 139; Dalz. & Gibs. p. 255. Tradescantia rupestris, Law, in Grah. Cat. Pl. Bo. (1839) p. 223 .-Flowers: Aug.-Sept.

Konkan: Dalzell!, Woodrow; S. Konkan on rocks, Dalzell & Gibson; Malwan, Dalzell! Kanana: Law!—Distrib. India (W. Peninsula).

2. Cvanotis tuberosa, Schultes f. Syst. v. 7 (1830) p. 1153. Root of fusiform tubers; stem 6-36 in. long, swollen and very hirsute at the very base, subcreet or prostrate and creeping below, densely villous or almost glabrous. Leaves sessile, the radical and lower cauline 6-10 by 1-1 in., often purple beneath, linear or ensiform, villous, the upper cauline leaves much shorter; sheaths of radical leaves 1 in. long, glabrous, those of the cauline leaves shortly silky. Cymes villous or densely hirsute, 2-1 in. long, usually pedunculate, in the axils of short ovate acute leaves (bracts) which are shorter than the cyme, strongly falcately decurved; bracteoles imbricate in 2 series, usually many, $\frac{1}{3}$ in. long. Sepals 1/4 by 1/18 in., linear-lanceolate, acute, densely villous Corolla 1 in. long, bluish-purple; lobes 10-1 in. long, ovate, subacute. Filaments spirally twisted, fusiform towards the tips, densely bearded above with blue hairs; anthers in long, yellow. Style thickened at the tip, with a tuft of hairs near the apex. Capsules $\frac{1}{6}$ by $\frac{1}{10}$ in., ellipsoid, the upper half hairy, the lower half glabrous. Seeds in long and broad, truncate at the base, shortly conic at the. apex, obscurely rugose, brown. Fl. B. I. v. 6, p. 386; Dalz. & Gibs. p. 256; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 249; Trim. Fl. Ceyl. v. 4, p. 312; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525; Watt, Dict. Econ. Prod. v. 2, p. 674. Tradescantia tuberosa, Roxb. Cor. Pl. v. 2 (1798) p. 5, t. 108; Grah. Cat. p. 223.—Flowers: Aug.-Sept.

Konkan: Stocks!, Law!; N. & S. Konkan, Law! Deccan: Purandhar, Bhiva! S. M. Country: Belgaum, Stocks! Ritchie, 743!; Dharwar, Woodrow; Badami, Woodrow. Kanara: Law!; Kála naddi, Ritchie, 743!—Distrib. India (W. Peninsula); Coylon.

Var. ascendens, C. B. Clarke, in DC. Monog. Phan. v. 3 (1881) p. 249. A smaller plant, more glabrous; branches ascending or procumbent, rooting and proliferous at the nodes; flowers blue. Fl. B. I. v. 6, p. 386; Prain, Beng. Pl. p. 1085. Cyanotis ascendens (sp.), Dalz. in Kew Journ. Bot. v. 4 (1852) p. 343; Dalz. & Gibs. p. 255. C. sarmentosa, Wight, Icon. v. 6 (1853) p. 33, t. 2087.

KONKAN: Stocks!, Law! DECCAN: hills near Chattersinghi (Poona districts), Cooke!; Bowdhan, near Poona, Ranade! S. M. Country: Belgaum, Dalzell!, Stocks!, Ritchic, 1466!; Badami, Woodrow.

3. Cyanotis fasciculata, Schultes f. Syst. v. 7 (1830) p. 1152. A small branched floccosely silky or cohwebby woolly herb; root annual, fibrous; branches 4–10 in. long, spreading, slightly rooting below, leafy. Leaves $\frac{3}{4}$ –2 by $\frac{1}{6}$ – $\frac{3}{8}$ in., sessile, linear-lanceolate or narrowed from the base to the tip, acute or acuminate, straight or recurved, cobwebby on both sides (rarely glabrate). Cymes $\frac{1}{4}$ – $\frac{3}{3}$ in. long, axillary and terminal; peduncles $\frac{1}{2}$ –1 in. long, 1 or more together; bracts lanceolate, $\frac{3}{8}$ – $\frac{1}{2}$ in. long, usually falcately recurved, acute, longer than (rarely shorter than or equalling) the cobwebby cyme; bracteoles $\frac{1}{4}$ – $\frac{1}{3}$ in. long, lanceolate or ovate-lanceolate, falcate, acuminate. Sepals $\frac{1}{6}$ by $\frac{1}{12}$ in., elliptic-lanceolate, acute, cobwebby. Corolla $\frac{1}{4}$ in. long, pink; lobes $\frac{1}{10}$ – $\frac{1}{5}$ in. long, ovate, obtuse or subacute. Filaments filiform, spirally twisted, bearded with hairs of 2 colors, blue and white (Dalzcll). Ovary with an erect tuft of hairs at the apex; style naked, fusiform at the tip. Capsules $\frac{1}{6}$ by $\frac{1}{12}$ in., oblong, 3-gonous, pilose at the apex. Seeds oblong, faintly rugose. Fl. B. I. v. 6, p. 387; Dalz. & Gibs. p. 255; Wight,

Icon. t. 2086; Trim. Fl. Ceyl. v. 4, p. 314; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525. *Gyanotis dichrotricha*, Stocks, in Wight, Icon. v. 6 (1853) p. 33, t. 2087.

In the 'Flora of British India,' p. 388, Tradescantia rupestris (Law, in Grah. Cat. p. 223) is given as a synonym for this plant, but it has also been given as a synonym for C. papilionacca in p. 385, which is the synonymy adopted by Dalzell (Bo. Fl. p. 255), and is, I think, correct.

Konkan: Stocks!, Law! Deccan; common, Woodrow; Poona districts, Cooke!; Paneligani, Cooke!, Bhiva!—Distrib. India (W. Peninsula); Ceylon.

VAR. glabrescens, C. B. Clarke, in DC. Monog. Phan. v. 3 (1881) p. 253. Leaves linear, glabrous, very minutely reticulate on both sides; bracts glabrous; bracteoles woolly. Fl. B. I. v. 6, p. 388.

DECCAN: Panchgani, Cooke! S. M. Country: Belgaum, Ritchie, 746!

4. Cyanotis cristata, Schultes f. Syst. v. 7 (1830) p. 1150. Root fibrous, the fibres very slender; stem branched from the base, the branches 6-18 in, long, slender, creeping and rooting below, then ascending, glabrous or with spreading hairs; internodes 1-3 in. long. Leaves $1\frac{1}{4}-2\frac{1}{4}$ by $\frac{1}{2}-\frac{3}{4}$ in., sessile, spreading, ovate-oblong, obtase or subacute, flat, glabrous or sparsely hairy, with villously ciliate margins, base rounded or cordate; sheaths short, hirsute. Flowers in scorpioidly recurved cymes 1-1 in. long, longer than the bractcoles; peduncles \$-4 in. long, sometimes almost 0; bracts like the leaves, \$\frac{2}{3}-1\frac{1}{2}\$ in. long, ovate, cordate, acuminate, ciliate; bracteoles ! by 1 in., lew or many, 2-seriate, ovate, falcate, acute, glabrous, or ciliate with long hairs. Sepals lanceolate, acummate. Corolla-tube not much exceeding the sepals; corolla-lobes ovate. Filaments fusiform below the tip, bearded Capsules $\frac{1}{10}\frac{1}{8}$ in. long, oblong, 3-gonous, Style naked. truncate, membranous, nearly glabrous. Seeds $\frac{1}{10}$ in long, 3-gonous, strinte and with 2 large pits on two of the faces, black. 11. B. I. v. 6, p. 385; Dalz. & Gibs. p. 256; Wight, Icon. t. 2082; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 247; Trim. Fl. Ceyl. v. 4, p. 311; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525; Prain, Beng. Pl. p. 1085. Tradescantia cristata, Jacq. Hort. Vind. v. 2 (1772) p. 64, t. 137; Grah. Cat. p. 223.—Flowers: Aug.-Oct.

A very common species during the rains. Konean: Stocks!; Parel (Bombay), Woodrow!; Bassein, Ragh! Decean: Malmbleshwar, Cooket, Woodrow!; Wassind, Woodrow. S. M. Countay: Belgaum, Rutchie, 742!—Distrib. Throughout Tropical India; Coylon, Malay Islands, Mauritius, Tropical Africa.

5. Cyanotis Wightii, C. B. Clarke, in DC. Monoy. Phan. v. 3 (1881) p. 250. A tail plant, 2-3 ft. high; root fibrous, woody, not tuberous; stems many, elongate, branched, usually softly villous. Leaves 6-18 by ½-1½ in., narrowly lanceolate, more or less sparsely hairy, with villously cliate margins, narrowed from the base to the tip; sheaths loose, ½-½ in. long, pilose. Cymes axillary and terminal, subcorymbose; peduncles variable in length, usually soveral together from a large linear-lanceolate, falcately-deflexed leaf; bracts below the cymes ovate-lanceolate, foliaceous, usually longer than the cyme but occasionally shorter; bracteoles falcately ovate, acuminate, ½-¾ in. long, ciliate, Sepals ¼ in. long, lanceolate, acute, hairy. Corolla blue; lobes shorter than the tube, ovate or suborbicular. Filaments bearded above. Ovary

obovoid, hirsute at the top; style naked, thickened at the tip. Capsules $\frac{1}{8}$ by $\frac{1}{12}$ in., obovoid, obtuse, hirsute at the apex, splitting to the base. Seeds $\frac{1}{16}$ in. long, truncate at the base, slightly tapering upwards with a shortly conical apex. Fl. B. I. v. 6, p. 386; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525. Cyanotis longifolia, Wight, Icon. v. 6 (1853) p. 33, t. 2084 (not of Benth.).—Flowers: Aug.—Sept.

Deccan: Mahableshwar, Cookel, Woodrow; Panchgani, Woodrow.—Distrie. India (W. Peninsula).

6. Cyanotis vivipara, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 226. Epiphytic, stemless, subscapigerous, clothed with scattered rufous spreading hairs; rootstock small, with tufts of pilose, radical, sessile, linear, acute leaves, 2-5 by \(\frac{1}{4}-\frac{3}{8}\) in., clothed and ciliate with rufous hairs. Scapes many from the root, very slender (almost filiform), rooting below, viviparous at the apex, with several small oblong-lanceolate acute leaves \(\frac{1}{4}-\frac{1}{2}\) in. long, from the axils of which short, slender, hairy peduncles issue, each bearing an umbel of 2-4 shortly pedicellate flowers, with 2 small oblong acute bracts beneath each umbel. Sepals \(\frac{1}{8}\) in. long, narrowly oblong, villous. Petals white, connate to the middle. Filaments not bearded (Clarke). Style naked. Capsules \(\frac{1}{8}\) by \(\frac{1}{20}\) in., oblong, obtuse, rufous-hairy, the valves much recurved after dehiscence. Seeds cylindric, smooth. Fl. B. I. v. 6, p. 388; Dalz. & Gibs. p. 255; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 244, t. 5, fig. 5; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525.—Flowers: Aug.—Sept.

Konkan: Woodrow; N. & S. Konkan, Law!; Sahyadri Hills, Dalzell! S. M. Country: Párva Ghát, Dalzell!—Distrib. India (W. Peninsula).

7. Cyanotis axillaris, Schultes f. Syst. v. 7 (1830) p. 1154. fibrous; stem annual, 6-18 in. long, stout or slender, diffusely branched, leafy, glabrous; branches subcreet and creeping below, or prostrate, glabrous or sparsely hairy, often colored; internodes 1-3 in. long. Leaves sessile, 2-6 by 1-1 in., narrowly linear or linear-lanceolate, acute or acuminate, flat, glabrous or more or less hairy; sheaths $\frac{1}{4} - \frac{3}{8}$ in. long, inflated, ciliate. Flowers violet-blue, clustered in the inflated sheaths, the cymes reduced to axillary fascicles of flowers with the small linear or linear-lanceolate bracteoles almost concealed in the leaf-sheaths. Sepals \(\frac{3}{8}\) in. long, spathulate-lanceolate, acuminate, sparsely hairy. Corolla-tube 1 in. long; corolla-lobes broadly ovate, subacute. Filaments fusiform below the tip, bearded. Style fusiform at the apex, naked. Capsules rather more than \(\frac{1}{4}\) in. long, oblong-ellipsoid, beaked, shortly stipitate, quite glabrous except the beak. Seeds 1 in. long, oblong, compressed, truncate at the base, rounded at the apex with a very short conical tip, beautifully mottled, dark brown, shining. Fl. B. I. v. 6, p. 388; Dalz. & Gibs. p. 256; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 244; Trim. Fl. Ceyl. v. 4, p. 315; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525; Prain, Beng. Pl. p. 1085; Watt, Diet. Econ. Prod. v. 2, p. 674. Tradescantia axillaris, Linn. Mantiss. (1771) p. 321; Roxb. Cor. Pl. v. 2 (1798) p. 5, t. 107; Grah. Cat. p. 223,—Flowers: Aug.-Sept.

DECCAN: common in the W. Deccan, Dalzell & Gibson; Poona, Cooke!, Woodrow. S. M. Country: Karlimatti, Woodrow! Gujarat: Baroda, Woodrow.—Distrib. Throughout India; Ceylon, East Asia, Tropical Australia.

4. FLOSCOPA, Lour.

Erect or subscandent herbs. Leaves lanceolate. Flowers in terminal or axillary panicles of secund but not scorpioid cymes; bracts minute. Sepals 3, oblong, free. Petals 3, obovate, free. Stamens 6, all perfect, or 1 imperfect, hypogynous; filaments filiform, glabrous. Ovary 2-celled; ovules solutary in each cell. Fruit a compressed or didymous loculicidal 2-celled capsule. Seed solitary in each cell, hemispheric.—Distable. Species about 11, tropical.

1. Floscopa scandens, Lour. Fl. Cochinch. (1790) p. 193. Root fibrous; stem rather slender, rooting below; internodes long; branches ascending, leafy above, glabrous or pubescent. Leaves 2-1 by 1-1 in., elliptic-lanceolate, acuminate, much narrowed at the base, subsessile or shortly petiolate, scaberulous above, glabrous or pubescent beneath: sheaths loose, short, glabrous or villous, the mouth fringed with long hairs. Flowers in terminal, sessile or shortly pedunculate villous or hirsute panicles, the flowers racemosely arranged along the long erect or ascending many-flowered branches of the panicle, pedicellate, small, subglobose, the lower flowers bracteate, the upper ebracteate; bracteoles minute. Sepals $\frac{1}{10^{-5}}$ in. long, rotund-ellipsoid, concave, villous. Petals slightly longer than the sepals, broadly obovate, white, lilac or pink. Filaments longer than the petals, equal, purplish; anthers goldenyellow. Ovary glabrous. Capsules rather broader than long, 10-1 in. in diam., suborbicular, abruptly subacute at both ends, shining. Seeds In long, pale glaucous, dorsally transversely wrinkled. Fl. B. I. v. 6, p. 390; Clarke, in DC. Monog. Phan. v. 3 (1881) p. 265; Trim. Fl. Ceyl. v. 4, p. 316; Woodr, in Journ. Bomb. Nat. v. 12 (1899) p. 525; Prain, Beng. Pl. p. 1086. Dithyrocarpus paniculatus, Kunth, Enum. v. 4 (1843) p. 79; Dalz. & Gibs. p. 256. Dithyrocarpus petiolatus, D. Rothii and D. undulatus, Wight, Icon. v. 6 (1853) p. 32, tt. 2079, 2080 .-Flowers: Oct.-Nov.

Konkun: on the Ghâts, Dalzell & Gibson. S. M. Counter: Londa, Cooke! Castlerock, Woodrow. Kanana: Woodrow; Jagalbet, Ritchie, 747!; Kâla naddi, Ritchie, 747!—Distrin. Throughout Tropical India in swampy places; Ceylon, East Asia, Tropical Australia.

The following plants of the Order are commonly grown in gardens:-

Rhoco discolor, Hance, in Walp. Ann. v. 3 (1853) p. 659. Leaves large, upright, much imbricated, narrowly lanceolate, acute, sheathed at the base, green above and purple beneath. Flowers blue or purple, almost included within the bracts. A native of Central America. When grown in a rich soil and regularly watered it is a striking plant easily propagated by cuttings. Common in gardens and in pots about bungalows, usually known as Tradescantia. Tradescantia discolor, L'Hérit. Sert. Angl. (1788) p. 8, t. 12; Grah. Cat. p. 223; Dalz. & Gibs. Suppl. p. 94; Woodr. Gard. in Ind. ed. 5, p. 517.

Zebrina pendula, Schnizl. in Bot. Zeit. v. 7 (1849) p. 870. A decumbent herb of creeping habit. It has green leaves $1\frac{3}{4}$ by $\frac{3}{4}$ in., striped (Zebra-like) with white above and purple beneath. It forms a good basket plant and is also useful for covering the earth in large pots or

tubs, or as an edging. It is a native of Mexico, and is easily propagated by cuttings. *Tradescantia zebrina*, Hort. ex Loud. Encyc. Pl. v. 2 (1855) Suppl. 2, p. 1340; Dalz. & Gibs. Suppl. p. 94; Woodr. Gard. in Ind. ed. 5, p. 517.

ORDER CXXXVI. FLAGELLARIACEÆ.

Shrubs with long, usually climbing leafy stems. Leaves many-nerved, usually long, with sheathing bases. Flowers small, regular, hermaphrodite or diœcious, in terminal panicles; bracts often lanceolate; bracteoles minute or 0. Perianth inferior, persistent; segments 6, free, small, imbricate, sub-2-seriate, dry or subpetaloid. Stamens 6, hypogynous; filaments free, filiform; anthers ovate or oblong, basifixed, 2-celled. Ovary superior, 3-celled; ovule solitary in each cell, anatropous, adnate to the axis; style short with 3 stigmatic arms, or styles 3 distinct. Fruit a small berry or a drupe with 1-3 pyrenes. Seeds laterally attached; testa membranous or thick; albumen floury; embryo lenticular.—Distrib. Genera 3; species 7-8, of the Old World and Pacific.

1. FLAGELLARIA, Linn.

A climbing shrub with long slender stems. Leaves many, lanccolate, with tendril-like tips; nerves many, parallel. Flowers many, small, hermaphrodite, fascicled or spicate along the branches of a terminal panicle; bracts small, scale-like. Perianth subpetaloid; segments 6, ovate, obtuse. Stamens 6, hypogynous. Ovary 3-celled; ovule solitary, affixed laterally; style divided nearly to the base into 3 subentire or 2-partite stigmatic arms. Fruit a small globose or ovoid drupe, with a thin succulent exocarp and a bony 1-2-seeded endocarp. Seed globose or ovoid; testa appressed, membranous.—Distrib. Species 1 Fijian and the following:—

1. Flagellaria indica, Linn. Sp. Pl. (1753) p. 333. A reed-like climber, quite glabrous, climbing over lofty trees by the leaf-tendrils; stem nearly 1 in. thick towards the base, terete, smooth; branches clothed with cylindric smooth, striate, closed, truncate sheaths; branchlets as thick as a crow-quill. Leaves sessile, 6-10 in. long, variable in breadth, lanceolate from a rounded base, shortly narrowed into the sheath, drawn out at the apex into a slender spiral tendril, many-nerved; sheaths cylindric, striate, 2-auricled at the apex. Flowers white, in shortly pedunculate irregularly laxly branched panicles 6-12 in. long. Outer perianth-segments \(\frac{1}{10} \) in. long, broadly ovate or suborbicular, obtuse; inner segments similar, more or less unequal. Anthers \(\frac{1}{2} \) in. long, deeply 2-fid at the base. Ovary to top of stigma \(\frac{1}{10} \) in. long; style-arms about \(\frac{1}{20} \) in. long. Drupe pisiform, red, smooth. Fl. B. I. v. 6, p. 391; Grah. Cat. p. 230; Dalz. & Gibs. p. 256; Trim. Fl. Ceyl. v. 4, p. 317; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525; Prain, Beng. Pl. p. 1087.

KONKAN: Stocks!; S. Konkan, Dalzell; among rocks near the sea, Dalzell & Gibson.—DISTRIB. Throughout India, chiefly near the coast; Ceylon, Tropical Asia and Africa.

ORDER CXXXVII. JUNCACEÆ.

Erect usually perennial herbs; stems tufted or with a creeping root-stock. Leaves flat, terete, or reduced to sheaths. Flowers usually small, hermaphrodite, regular, in axillary or terminal cymes, green or whitish and membranous, or brown and coriaceous; bracts small. Perianth inferior, persistent; segments or lobes 6, more or less 2-seriate, free or connate below in a very short tube, persistent, imbricate. Stamens usually 6, adnate to the base of the perianth-lobes or hypogynous, occasionally the 3 of the inner series absent; filaments filiform; anthers basifixed. Ovary superior, 3-celled or 1-celled; or ules 3 basilar in 1-celled ovaries, numerous on the inner angles of the cells in 3-celled ovaries, anatropous. Fruit a capsule 1-3-celled, loculicidally 3-valved. Seeds erect; testa membranous, often produced at each end; albumen dense; embryo small, near the hilum.—Distrib. Genera 14; species about 200.

1. JUNCUS, Linn.

Perennial (rarely annual) glabrous herbs; stems simple under the inflorescence. Leaves radical, or few near the base of the stem, linear, or terete, or reduced to sheaths. Flowers small, usually clustered in fascicles or 2-fid cymules, either sessile capitate, or unequally pedunculate paniculate, the whole inflorescence terminal or subterminal on the scape-like stoms, with 1-3 leafy bracts. Perianth with 6 glume-like segments, free, lanceolate or oblong, often with scarious margins, the 3 outer keeled or with a thickened midrib. Stamens 6 (rarely 3), hypogynous or nearly so; anthers oblong or linear, erect; dehiscence longitudinal, introrse. Ovary 1-celled or imperfectly or perfectly 3celled: oyules many on each placenta; style filiform; stigmatic arms 3, filiform, often spirally twisted. Fruit a capsule, dehiseing by 3 valves with mesial placentas, or rarely by 3 valves leaving the placentas persistent or connate in a central column. Seeds small, ovoid; testa striate, reticulate, or transversely lineate; embryo small, near the base of the fleshy albumen.—Distrib. Species about 150, temperate and arctic, rarely tropical.

- 2-5 ft. high; leaves solid, few; seeds shortly tailed at each end; floral bracts ovate, mucronate, with membranous margins; anthers longer than the filaments
- 2 ft. high; leaves with a central hollow; seeds not tailed; floral bracts hyaline, acuminate; anthers shorter than the
- 1. J. maritimus.
- filaments 2. J. punctorius.
- 1. Juncus maritimus, Lumk. Encyc. Méthod. v. 3 (1789) p. 264. Perennial, densely cospitose; stems 2-5 ft. high, erect, terete, striate: pith solid; basal sheaths short, narrow, obtuse, pungent, or produced into a solid terete pungent leaf. Flowers in decompound cymes 1-2 in. long, with erect branches; floral bracts ovate, mucronate, the margins broadly membranous. Sepals $\frac{1}{6}-\frac{1}{6}$ in. long, pale-green, with membranous Petals slightly shorter, obtuse. Stamens 6; onnate at the base; anthers linear, yellow, longer than the filaments. Capsules longer than the sepals, ovoid or conic, 3-gonous, obtuse, mucromate, shining, 3-celled. Seeds oblong or obovoid, caudate at each end. Fl. B. I. v. 6, p. 393; Buchen. Moneg.

Junc. in Engl. Bot. Jahrb. v. 12 (1890) p. 256; Boiss. Fl. Orient. v. 5, p. 354; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525.—Flowers: Oct.

SIND: Woodrow; sandy shores of Sind, Stocks, Dalzell, 1!—DISTRIB. Afghanistan and westward to the Atlantic, N. and S. America, Australia.

2. Juncus punctorius, Linn. f. Suppl. (1781) p. 208. Tall, stout, perennial, pale-green, 2 ft. high; stems soft, often as thick as a goosequill, terete, smooth. Leaves as long as the stem and nearly as stout, acuminate, irregularly septate, cylindric or compressed, multitubular with a central hollow. Flowers brownish-red in erect umbellately decompound cymes with divaricate branches; bracts short, pungent, the floral hyaline, acuminate, shorter than the flowers. Sepals \(\frac{1}{10} - \frac{1}{8}\) in long, oblong-lanceolate, acute. Petals broader than the sepals, subacuto. Stamens 6, shorter than the sepals; filaments filiform, as long as or somewhat longer than the anthers; anthers linear, yellow. Ovary 3-gonous, ovoid; style cylindric, longer than the ovary. Capsules as long as the sepals, 3-gonous-ovoid, mucronate, 3-celled. Seeds ovoid, minute, scarcely \(\frac{1}{50}\) in. long, costate and reticulate, pale brown, not tailed. Fl. B. I. v. 6, p. 395; Buchen. in Engl. Bot. Jahrb. v. 12 (1890) p. 277; Boiss. Fl. Orient. v. 5, p. 357; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525.—Vern. Dher.

SIND: Stocks, 1093!

There is but a single specimen from Sind in Herb. Kew. from Stocks and 1 from Beluchistan.—Distrin. Beluchistan; westward to Persia, Arabia, and N. & S. Africa.

ORDER CXXXVIII. PALMÆ.

Shrubs or trees, solitary or gregarious, naked or prickly; stem erect. scandent or decumbent, rarely branched above. Leaves alternate, usually crowded at the apex of the stem, plicate in bud, pinnatisect or palmate, rarely entire or 2-pinnatisect; petiole sheathing. Flowers small, hermaphrodite or 1-sexual, usually 3-bracteolate, in branched spikes or panicles, enclosed in one or more large sheathing spathes. Perianth inferior. 2-seriate; segments in each series 3, usually all free, imbricate or valvate. Stamens usually 6, inserted in 2 series opposite the perianth-segments. sometimes 3 opposite the outer series of segments, occasionally many at the base of the perianth, usually included; filaments free or connate, subulate or filiform (rarely flattened); anthers versatile, 2-celled; dehiscence lateral or extrorse. Ovary 1-3-celled or of 3 one-celled carpels; ovules in each carpel 1-2, anatropous, adnate to the wall, base, or top of the cell; stigmas 3, usually sessile. Fruit a 1-3-celled drupe or hard berry, or of 1-3 carpels; pericarp smooth or rough, or clothed with downward-imbricating shining scales. Seeds erect or laterally attached, rarely pendulous; raphe usually branching all over the testa: albumen horny or bony, uniform or ruminate; embryo small, in a cavity near the surface of the albumen .- DISTRIB. Genera about 130; species about 1100, chiefly tropical.

Leaves pinnate or pinnatisect.

Fruit not clothed with scales; stem erect, unarmed; neither the leaf-rhachis nor the spadix nor the sheath produced as an armed flagellum.

Leaves simply pinnate; leaflets induplicate, without midrib; flowers discious	1. Phenix.
Leaves simply pinnate, linear or lanceolate, with midrib and reduplicate sides, the terminal leaflets	
often confluent as a plaited limb. Spadix androgynous, on the stem below the leaves;	•
clusters of 3 flowers, 1 male between 2 females, all along the spike; stamens numerous	2. Pinanga.
auricled; stamens on	3. Arenga.
dimidiato-flabelliform; spadix axillary, followed progressively downwards by alternate male and	
female spadices	4. CARYOTA.
imbricating scales; leaf-rhachis or spadix or sheath produced as an armed flagellum	5. Calamus.
Spadix axillary, from among the leaves; flowers polygamous	6. NANNORRHOPS.
Spadix terminal; flowers hermaphrodite; monocarpic palms flowering once and then dying	7. Corypha.

1. PHCENIX, Linn.

Tall trees or low shrubs, the entire stem or the upper portion only closely covered by the more or less rhomboid bases of the petioles; stems occasionally branched. Leaves pinnate; leaslets entire, linear, folded longitudinally and attached obliquely with their folded bases to the woody common petiole, the lowest pinnæ often transformed into spines; midrib 0, but a slender nerve on either side of the fold; main nerves longitudinal, parallel; common petiole semiterete or flat, often widening at the base into a sheath, which frequently expands into a mass of tough reticulate fibres. Flowers diccious, small, yellowish, corinceous, on usually several branched axillary (interfoliar) erect or drooping spadices. Spathe basilar, complete, coriaceous. TLOWERS: Sepals 3, connate in a cupular 3-toothed calvx. Petals 3, obliquely ovate, valvate. Stamens 6; filaments short, subulate; anthers erect, dorsifixed. Pistillode minute or 0. Female flowers: Sepals 3, connate in a globose accrescent calyx. Petals 3, rounded, imbricate. Staminodes 6, free or connate in a 6-toothed cup. Carpels 3, free; ovules erect; stigmas sessile, hooked. Fruit oblong, terete, 1-seeded, with a terminal stigma, a fleshy pericarp and a membranous endocarp. Seed oblong, ventrally grooved; albumen uniform or subruminate; embryo dorsal or subbasilar .- DISTRIB. Asia and Africa; species about 11.

```
Tall palms; stems from 15-50 ft. high.

Stem slender, 30-50 ft. high; leaves 7-12 ft. long; fruit orange-yellow

Stem very stout, 15-20 ft. high; leaves 3-5 ft. long; fruit brown

Low palms with very short stems, often stomless.

Stem very short or 0; fruiting peduncles short; bases of leaves thickened and decurrent on the common petiole

Stem ½-10 ft. high; fruiting peduncles long; bases of leaves not thickened and not decurrent on the common petiole

4. P. humilis yar. pedunculata.
```

1. Phænix sylvestris, Roxb. Hort. Beng. (1814) p. 73. graceful palm when not cut for tapping, 30-50 ft. high, with a large thick hemispherical crown; trunk clothed with the persistent bases of the petioles. Leaves greyish-green, 7-12 ft. long, quite glabrous, pinnate; leassets 6-18 by 4-1 in., fasciculate, 2-4-farious, rigid; petioles short, compressed only towards the apex, bearing at the base a few channelled triangular spines reaching 4 in. long. Male rlowers white, scented. Spadix 2-3 ft. long, erect; branches filiform: peduncle much Spathes 12-16 in. long, scurfy, separating into 2 hoatcompressed. Flowers \(\frac{1}{4} - \frac{1}{3}\) in, long, numerous, augular, oblique. shaped valves. Calyx cup-shaped, with 3 short rounded teeth. Petals 3 or 4 times as long as the calyx, concave, warted on the outside. Filaments very short (scarcely any), free; anthers linear, shorter than the petals. FEMALE FLOWERS: Spadix and spathe as in the male; fruiting peduncles short, about 6 in. long. Flowers distant, roundish. Calyx cup-shaped, obsoletely 3-toothed. Petals 3, very broad, convolutely imbricate. Staminodes 3 or 4. Fruiting-spadix 3 ft. long, nodding, much compressed, of a golden orange color. Fruit $1-1\frac{1}{4}$ in. long, oblong-ellipsoid, orange-yellow, edible. Seeds ² in. long, rounded at the ends, grooved on one face, pale brown. Fl. B. I. v. 6, p. 425; Grah. Cat. p. 224; Dalz. & Gibs. p. 278; Griff. Palm. Brit. E. Ind. (1850) p. 141, t. 228, A; Talb. Trees, Bomb. ed. 2, p. 341; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525; Prain, Beng. Pl. p. 1096; Brandis, Ind. Trees (1906) p. 645; Watt, Diet. Econ. Prod. v. 6, part 1, p. 208.—Flowers: Jan.-VERN. Shindi. Feb.

Known as the Wild Date-Palm or the Date-sugar Palm, cultivated and often self-sown; tolerably common throughout India, common in most ground throughout the dry districts of the Bombay Presidency, usually along braks and in the beds of streams and watercourses, certainly indigenous (Tallot).—Distrib. Throughout India, wild or more often cultivated.

The leaves are used for making mats, baskets, brooms, and funs. The petioles are beaten and the fibre twisted into ropes which are employed in drawing water from wells. The fruit is eaten by the poorer classes, but is not pulatable. From the juice obtained by tapping the tree, a coarse sugar is manufactured by boiling. See Watt, Diet. Econ. Prod. 1. c.

2. Phœnix robusta, Hook. f. Fl. B. I. v. 6 (1892) p. 427. Trunk 15-20 ft. high and about 15 in. in diam., clothed and appearing tessellated from the spirally arranged small leaf-sheaths. Leaves 3-5 ft. long, glabrous, shining, shorter, broader, thinner, and smoother than those of Phœnix sylvestris; leaflets fascicled, quadrifarious, strict, strongly conduplicate. Fruiting peduncle 2 ft. long. Spathe fringed with brown wool on the keel (Brandis). Ripe fruit brown (Prain).

The plant was collected by Sir J. Hooker on Parasnath in Behar and seems also to have been obtained by Woodrow on a hill near Bhorkas in the Poona districts. (Notes on a journey from Poona to Nagotna in Records Bot. Survey of India.) The great size of the trunks and their tessellated appearance, due to the comparatively small size of the old appressed leaf-sheaths, furnish good characters. Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 526, and in Records Bot. Surv. Ind. v. 1, part 6 (1895) p. 94; Braudis, Ind. Trees (1906) p. 645. Phanix humilis robusta, Becc. Males. v. 3 (1886-1890) p. 379.—Flowers: Feb. Vern. Shelu.

3 g

DECCAN: gregarious on the top of trap hills near Bhorkas (Poona districts), Woodrow; Nandgaon (W. Gháts), Woodrow.—Distrib. Behar (on Parasnath).

In the place near Bhorkas, where it is locally abundant, it is used largely for the

manufacture of date-matting (Woodrow).

3. Phœnix acaulis, Roxb. Hort. Beng. (1814) p. 73; Buch.-Ham. ev Roxb. Fl. Ind. v. 3 (1832) p. 783 *. A dwarf palm, often almost stemless; stem bulbiform, 6-10 in. in diam., clothed with the sheaths and the bases of the petioles, the ends of which are often bristly with the protruding hard fibro-vascular bundles. Leaves 2-6 ft. long; leaflets 10-20 by $\frac{1}{3}$ in., stiff, fasciculate, the base thickened and decurrent: petioles 1 it. or more long, with spines 2-6 in. long. Spadix 6-10 in. long, compressed, rather longer than the spathe; branches very stout, vellow. Spathes about 6 in, long with their bases rather below the surface of the ground. MALE TLOWERS 1-1 in. long, alternate, solitary, pale-vellow. Stamens 6; filuments very short. Pistillode 0. Finalic FLOWERS: Spadix and spathe as in the male. Calyx cup-shaped, truncate, with three obscure teeth on the margin. Petals 3, subrotund, thick and fleshy, concave, smooth. Fruiting peduncle short, usually concealed among the leaves. Fruit $\frac{1}{2}$ - $\frac{2}{3}$ in long, oblong-ellipsoid, black when ripe, edible. Seed \(\frac{1}{4} - \frac{1}{3}\) in. long, deeply grooved. Fl. B. I. v. 6, p. 426; Dalz. & Gibs. p. 278; Griff. Palm. Brit. E. Ind. (1850) p. 137; Talb. Trees, Bomb. ed. 2, p. 342; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525; Prain, Beng. Pl. p. 1096; Brandis, Ind. Trees (1906) p. 645; Watt, Dict. Econ. Prod. v. 6, part 1, p. 199 .- Flowers: Dec.-Jan. VERN. Shevra : Shilind.

The Dwarf Date-Palm. Kanara: Ghits of the Sirsi taluka (N. Kanara), Talbet.—Distrib. Northern and Central India, Birma, W. Pempsula.

4. Phœnix humilis, Royle, Illustr. (1839) p. 394. Var. pedunculata, Becc. Males. v. 3 (1886-1890) p. 379. Monocious, soboliferous; stem ½-10 ft. high, by 9 in. in diam., densely covered with the bases of the fallen petioles more or less spirally arranged; root suckers developing when the primary stem has been burnt or injured. Leaves 4-8 ft. long; leaflets pliable, 10-20 by ½-½ in., fasciculate, more or less quadrifarious, the uppermost sometimes confluent, base not thickened and not decurrent into the common petiole; petioles 1 in. broad at the base, with spines reaching 3 in. long. Spathe about 8 in. long, with fringed margin. Spadix scarcely exceeding the spathe. Calyx cup-shaped, 3-toothed. Fruiting spadix 3-4 ft. long, the compressed peduncle much elongate. Fruit ½ in. long, at first orange then black, edible. Fl. B. I. v. 6, p. 427; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 526; Taib. Trees, Bomb. ed. 2, p. 342: Brandis, Ind. Trees (1906) p. 645 (in part). Phænix pedunculata (sp.), Griff. Palm. Brit. E. Ind. (1850) p. 139.—Flowers: Dec.—Feb. Doubtfully distinct from P. acaulis.

Common on the Ghâts of N. Kanara, Tulbot.—Distrin. Hilly districts of India; China, Cochinchina.

The leaflets are made into mats commonly used for covering bales of red pepper in the Dharwar district (Talbot).

^{*} Roxburgh attributes this to himself in Hort, Beng. (1814), but to Buchanan in Flor, Ind. (1832).

Phonix rupicola, T. Anders. in Journ. Linn. Soc. v. 11 (1870) p. 13. A small graceful palm a native of Sikkim, occasionally grown in gardens. It develops a stem very slowly and when fully grown the trunk is 12-20 ft. high by 8-10 in. in diam. It has bright green leaves which are somewhat spirally twisted, leaflets 18 by ½-1 in., and an oblong shining yellow fruit $\frac{3}{4}$ in. long. Fl. B. I. v. 6, p. 425; Woodr. Gard, in Ind. ed. 5, p. 526; Brandis, Ind. Trees (1906) p. 646.

2. PINANGA, Blume.

Unarmed; stem erect, annulate. Leaves pinnatisect, with the upper segments confluent. Flowers monœcious, androgynous, ternate, 1 female between 2 males, the clusters in 2 or 4 or 6 series on spadices from the stem below the leaves; spathe solitary. Male flowers obliquely 3-quetrous. Sepals 3, acute, keeled, not imbricate. Petals 3, ovate or lanceolate, valvate. Stamens 6 or many; anthers subsessile, basifixed, erect. Female flowers much smaller than the males, ovoid or globose. Sepals 3, orbicular, imbricate. Petals 3, orbicular, broadly imbricate. Ovary 1-celled; ovule basilar, erect; stigmas 3. Fruit ovoid or ellipsoid, with fibrous pericarp. Seed ovoid or ellipsoid; albumen ruminate; embryo basilar.—Distrib. Tropical Asia and Malaya; species about 24.

1. Pinanga Dicksonii, Blume, Rumphia, v. 2 (1836) p. 77 in Obs. A very slender, smooth, green-stemmed palm; trunk solitary, tall, 16-20 ft. high by 1-2 in. in diam., soboliferous. Leaves pinnate, forked, 4 ft. long; leaflets numerous, sessile, elongate, 12-24 by \(\frac{3}{4}\)-1 in., broadly linear, promorse, 5-7-nerved, the uppermost confluent. Spadix refracted; branches 4-8, stout, densely clothed with imbricating flowers. Spathe simple, rigid, compressed. Male flowers: Sepals subulate. Petals rather longer than the sepals, ovate, cordate, valvate, tapering at the tips. Stamens numerous, 20-30; filaments very short; pistillode 0. Finally flowers: Sepals reniform. Petals similar. Fruit \(\frac{1}{2}\)-\(\frac{3}{4}\) in. long by \(\frac{1}{3}\) in. in diam., ellipsoid. Fl. B. I. v. 6, p. 409; Talbot, Trees, Bomb. ed. 2, p. 339; Brandis, Ind. Trees (1906) p. 647. Areca Dicksonii, Roxb. Fl. Ind. v. 3 (1832) p. 616; Griff. Palm. Brit. E. Ind. (1850) p. 153, t. 231.

KANARA: evergreen forests near the Gairsoppa and Nilkund Gháts of N. Kanara, gregarious and locally abundant, Talbot.—Distrib. India (W. Peninsula).

3. ARENGA, Labill.

Tall stout palms, flowering first from an upper leaf-axil and successively from the lower; upper portion of trunk densely clothed with the black fibrous remains of the leaf-sheaths. Leaves terminal, long, pinnatisect; leaflets long, linear, usually præmorse, with a midrib and numerous longitudinal nerves and one or two auricles at the base. Spathes many, clothing the peduncle of the spadix. Spadix axillary, large, much-branched; branches slender, pendulous; peduncles short, decurved. Male and female flowers usually solitary and in separate

3 G 2

spadices, rarely 3-nate, a female between two males. Main flowers symmetric. Sepals 3, orbicular, imbricate. Petals oblong, valvate. Stamens numerous; filaments short; anthers apiculate; pistillode 0. Female flowers subglobose. Sepals cordate. Petals triangular, valvate. Staminodes many or 0. Ovary subglobose, 3-celled. Fruit obovoidly globose, 2-3-seeded; stigmas terminal. Seeds compressed or plano-convex; albumen uniform; embryo dorsal.—Distrib. Tropical Asia and Australia; species 10.

1. Arenga Wightii, Griff. in Calc. Journ. Nat. Hist. v. 5 (1845) p. 475. Monœcious, forming dense clumps by suckers. Trunk 3-10 ft. high, as thick as a man's thigh, soboliferous. Leaves 12-28 ft. long: leastets alternate, crowded, 3-31 ft. long by 11-2 in., linear-ensiform. palo beneath, the margins sparingly toothed from the middle. 2-nuricled at the base, the lower auricle very large, 11-2 in. long, obliquely overlapping the petiole, the apex narrowed, unequally 2-lobed and jaggedtoothed. Spadix decurved, pendulous; peduncle about 2 ft. long, quite concealed by the sheathing imbricate lacerate spathes. MALE FLOWERS strongly scented. Branches of the spadix about 2 ft. long, subfastigiate, slender, with a scaly bract at the base of each; flowers distant, rather large, in pairs; buds acute. Sepals 3, orbicular, imbricate, with thick bases. Petals 3, oblong, very thick and coriaceous. Female Plowers: Branches of the spadix attenuate towards the ends, where they bear rudimentary flowers. Sepals broadly cordate, small. Petals triangular, acute or cuspidate. Stigmas 3, short, recurved. Fruit spirally arranged and crowded on the lower halves of the branches of the spadix (the upper halves naked), about as large as a crab-apple, globosely turbinate, broader than long, much depressed at the apex, crowned with the remains of the stigmas. Seeds 3, convex on one face, unequally angular on the other, marked with branched veins converging at the apex of the seed, smooth, brown; albumen uniform. Fl. B. I. v. 6, p. 422; Griff. Palm. Brit. E. Ind. (1850) p. 167, t. 235, E; Talb. Trees, Bomb. ed. 2, p. 340; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525; Brandis, Ind. Trees (1906) p. 648.—Flowers: Nov.-Jan. Venn. Dhudasal.

KANARA: Ankola Ghats of N. Kanara; common on the Mushki Ghat about 1500 ft. elevation; very common on the Ghats near the falls of Gairsoppa in evergreen forests; Divimana Ghat (N. Kanara), Woodrow,—Distrib. India (W. Peninsula).

Arenga saccharifera, Labill. in Mém. Inst. Par. v. 4 (1801) p. 209. A beautiful and magnificent palm with trunk 20-40 ft. high, and large dark-green shiuing leaves 20-25 ft. long, which take a graceful plume-like curve towards the summit. Fine specimens may be seen in Bombay, where it is grown as an ornamental tree. It is a native of Assam, Birma, and the Malay Peninsula. II. B. I. v. 6, p. 421; Griff. Palm. Brit. E. Ind. (1850) p. 164; Woodr. Gard. in Ind. ed. 5, p. 518; Brandis, Ind. Trees (1906) p. 648.

4. CARYOTA, Linn.

Tall unarmed palms with annulate, naked or sheathed trunks, soboliferous or not, flowering when full grown from the axils of the leaves, beginning at the upper and then successively downwards, after which the plant dies, usually a male and a female spadix alternately. Leaves terminal, usually forming an elongate coma, few, large, bipinnatisect or decompound; leaslets (pinnules) very obliquely dimidiately flabelliform or cuneiform, promorse or rounded at the tip, their bases swollen at the point of attachment; nerves and veins flabellate. Flowers monoccious, solitary and nude, or ternate with the central flower female, on the slender pendulous branches of axillary (interfoliar) much fastigiately branched spadices with short thick peduncles. Spathes 3-5,. incomplete, tubular. MALE PLOWERS symmetric. Sepals 3, short, rounded, coriaceous, closely imbricate. Petals 3, larger than the sepals, linear-oblong or ovate-oblong, valvate. Stamens numerous; filaments short; anthers long; pistillode 0. Female flowers subglobose, smaller than the male. Sepals 3, ovate or orbicular, concave, closely imbricate. Petals 3, rounded, valvate. Staminodes 3 or 6 or 0. Ovary obovoid, 3-gonous, 3-celled; ovule in each fertile cell solitary; stigma sessile, 3-lobed. Fruit glabrous, 1-2 (rarely 3) -seeded, crowned by the stigma; sarcocarp full of rhaphides. Seed erect; albumen ruminate; embryo dorsal. - Distrib. Tropical Asia, Malaya and Australia; species about 10.

1. Caryota urens, Linn. Sp. Pl. (1753) p. 1189. Trunk 40-60 ft. high by 1-1; ft. in diam., cylindric, annulate, not or scarcely soboliferous, smooth, grey, shining, covered with long shallow cracks with corky edges. Leaves bipinnate, 18-20 by 10-15 ft.; primary divisions 5-6 ft. long, arched and drooping; leaflets 4-8 in. long, fasciculate or alternate, cuneiform, obliquely truncate, irregularly serrate-toothed on the truncate margin, the upper margin produced beyond the leaslets into a tail, flabellately veined, quite glabrous, bright green, shining, the margins at the base recurved; petiole very stout, about 3 in. thick at the base; sheath smooth, with fibrous netted margins. Spadix 10-12 ft. long; branches simple, forming a dense tassel drooping from the stout short peduncle, all reaching the same level. Spathes 12 ft. long, closely embracing the peduncle of the spadix. MALE PLOWERS: Buds narrowly cylindric, 1 in. long. Sepals cordate, ciliate. Petals coriaceous, concave, reddish. Stamens about 40; filaments short, white; anthers acuminate, as long as the petals. Female flowers: Sepals rather broader than in the male. Staminodes usually 3. Ovule solitary, erect. Fruit $\frac{2}{3}-\frac{3}{4}$ in. in diam., reddish; pericarp acrid, stinging. Seeds 1 or 2. Fl. B. I. v. 6, p. 422; Grah. Cat. p. 226; Dalz. & Gibs. p. 278; Griff. Palm. Brit. E. Ind. (1850) p. 169; Trim. Fl. Ceyl. v. 4, p. 324; Talb. Trees, Bomb. ed. 2, p. 341; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525; Prain, Beng. Pl. p. 1093; Brandis, Iud. Trees (1906) p. 654; Watt, Dict. Econ. Prod. v. 2, p. 206.—Flowers during most of the year. VERN. Bherli-mad.

Very common in the evergreen forests of the Konkan and N. Kanara. DISTRIB.

Throughout the hotter parts of India; Ceylon, Tropical Asia, Malaya.

The leaves give the Kittul fibre, which is very strong and is made into ropes, brushes, baskets, and other articles; the fibre from the sheathing petioles is made into ropes and fishing-lines. The trees are tapped for toildy, which when boiled yields course sugar (jaggery). The pith furnishes a good palatable sage, while the outer part of the stem supplies a hard durable wood used for agricultural purposes and in general use for field-tools.

The tree is known as the Hill-Palm or Sago-Palm; sometimes called the Fish-tail

Palm. See Watt, Diet Econ. Prod. I.c.

5. CALAMUS, Linn.

Perennial, armed, usually scandent tufted palms. Leaves alternate, pinnatisect: leaflets acuminate: nerves parallel: rhachis often produced as an armed flagellum; sheath armed, produced into a ligule or othrea with or without a lateral armed flagellum. Flowers small, polygamodiœcious, in usually distichous often scorpioid spikelets, solitary or binate (a female, a male, or both) in the axils of the bracteoles of axillary usually much-elongate and much-branched spadices. Spathe tubular or open, persistent, sheathing the peduncle and branches of the spadix, and passing into bracts and bracteoles. Male flowers: Calvx cupular, 3-toothed. Petals 3, acute, coriaceous, valvate, Stamens 6; filaments short; unthers dorsifixed. Female Plowers slightly accrescent; fruiting pedicelliform or explanate. Calyx tubular, 3-toothed. Corolla tubular below, 3-fid; lobes valvate. Staminodes connate into a Ovary incompletely 3-celled, clothed with retrorse scales; ovules basilar, erect; style short or long; stigmas 3. Fruit globose or ellipsoid, beaked; pericarp thin, clothed with appressed, deflexed, closely imbricate scales. Seed subglobose or oblong, smooth or pitted; albumen uniform or ruminate; embryo vertical or basal.—Distrib. India, Malay Archipelago, S. China, N. Australia; a few in Tropical Africa; species 160-170.

1. Calamus pseudotenuis, Becc. ex Hook. f. Fl. B. I. v. 6 (1892) p. 445. Stem slender, extensively climbing; sheaths set with many unequal, straight, flat, very sharp spines reaching sometimes 1 in. long. Leaves about 4 ft. long; petioles 8 in. long, with a few solitary short spreading spines; rhachis not produced into a flagellum, armed with slender flat spines, scurfy when young; flagellum of sheath very long, slender, compressed below, thin, cylindric, and set with half rings of deflexed hooked spines; leaflets 50 or more, nearly equidistant, 8-15 by \(\frac{1}{3}-1\) in., linear-lanceolate, acuminate, thin, with setulose margins; nerves 3-5. Male flowers: Spikes of the spadix long, slender, decurved. Flowers usually 2-3 together, \(\frac{1}{10}-\frac{1}{6}\) in. long, subglobose. Calyx cupular, lobes acute. Petals sessile, short, polished. Filaments very short. Finale flowers: Spadix very long, slender; branches distant, armed with short deflexed spines. Spathes flattened, the lower clongate, tubular, 2-edged. Fruit ovoid, \(\frac{3}{3}-\frac{1}{2}\) in. in diam.; beak stout, \(\frac{1}{4}\) in. long, conical; scales 9-12 in a vertical row, rounded, dull-yellow with brown scarious margins. Trim. Fl. Ceyl. v. 4, p. 330; Talb. Trees, Bomb. ed. 2,

p. 345; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 526; Brandis, Ind. Trees (1906) p. 652.

KANARA: common on the Ghats of N. Kanara, Talbot. - Distrib. India (W. Peninsula); Ceylon.

2. Calamus Thwaitesii, Becc. ex Hook. f. Fl. B. I. v. 6 (1892) p. 441. Stem stout, erect, 12 in. in diam,; leaf-sheaths with close, oblique, raised lines which are thickly set with flattened, stiff, sharp, shining, deflexed, ovate-lanceolate or ensiform spines, 1-2 in. long and with smaller narrower erect ones below each line of large ones. Leaves 41 ft. long; petioles 7-12 in. long, stout, channelled above, set with imperfect rings of flat spines; rhachis not produced into a flagellum, with a raised ridge, set beneath with half rings of straight, slightly deflexed, dark brown spines; leaflets many, 2-21 ft. by 11-2 in., equidistant or fasciculate, very acute, with ciliate and spinulose margins, 3-nerved beneath, with the midrib retrorsely spinulose. MALE FLOWERS ovoid, $\frac{1}{5} - \frac{1}{4}$ in. long. Spadix up to 20 ft. long, very slender, with very long flagella set with half whorls of short, deflexed, hooked spines. Calyx broadly 3-lobed; lobes rounded. Petals ovate-oblong, sessile. Filaments very broad, narrowed at the top into a geniculate tip carrying the versatile anther. Finale flowers in long. Spadix with stouter branches than the male. Perianth enlarged in fruit. Fruit seated on the sessile enlarged perianth, 3-1 in. long including the beak, ellipsoid; beak stout, conical, straight; scales rather large, tumid, with a narrow dark-brown border, shallowly channelled in the centre, 5-6 superposed in each vertical row, dull orange-yellow; albumen uniform. Trim. Fl. Ceyl. v. 4, p. 330; Talb. Trees, Bomb. ed. 2, p. 344; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 526; Brandis, Ind. Trees (1906) p. 652.— Flowers: Feb.-Mar. VERN. Handibet.

Kanara: common in the evergreen forests at the foot of the Nilkund Ghát of N. Kanara, Talbot.—Distrib. India (W. Peninsula); Ceylon.

Calamus Rotang, Linn. Sp. Pl. (1753) p. 325. Sometimes grown in gardens, abundant in the southern part of the Western Peninsula and in Ceylon, but not indigenous in the Bombay Presidency. When young it is a very graceful plant, with pinnate leaves 1-2 ft. long, and with black spines ½ in. long on the stem and leaf-sheaths, but when it attains a height of 5-6 feet and develops its whip-like flagella armed with numerous sharp recurved thorns it is generally considered time to cut it down. Fl. B. I. v. 6, p. 447; Trim. Fl. Ceyl. v. 4, p. 331; Woodr. Gard. in Ind. ed. 5, p. 520; Brandis, Ind. Trees (1906) p. 652.

6. NANNORRHOPS, H. Wendl.

A gregarious, tufted, low-growing, glabrous palm, with prostrate, branching, robust rhizomes or stems. Leaves cuneately flabellate, rigid, plicate, split into curved 2-fid segments; petiole short. Spadix axillary (intrafoliar), much-branched; spathes tubular, sheathing. Flowers polygamous. Calyx tubular, membranous, unequally 3-lobed. Corolla 3-partite; segments valvate. Stamens in hermaphrodite flowers

- 6, in male flowers about 9. Ovary 3-gonous: ovules basilar; style short; stigma 3-toothed. Drupe small, globose or oblong, 1-seeded. Seed free, erect, ventrally hollowed; hilum small; albumen uniform; embryo dorsal or sub-basilar.—Distrib. India (Sind and the Panjáb); Afghanistan; species 1.
- 1. Nannorrhops Ritchieana, Griff. in Calc. Journ. Nat. Hist. v. 5 (1845) p. 342 (under Chamærops). Gregarious, the leaves usually tufted from an underground much-branched rhizome 8-10 ft. long, as thick as a man's arm, at times from an erect branching stem reaching 20 ft. high. Leaves 2-3 ft. long and broad, cuneately flabellate, rigid, plicate, greyish-green, consisting of 8-15 linear rigid segments 12-15 in. long, with often interposed fibres, folded, 2-partite; petioles unarmed, concave, with a mass of rust-colored wool at the base. Flowers polygamous, male and hermaphrodite. Spadix pyramidal; branches ascending and recurved; branchets slender. Flowers in pairs in the axils of hyaline bracts, distinct or connate, and bicuspidate. Calyx thinly membranous, flat, 3-toothed. Petals counate at the base. Stamens 6 (sometimes 9 in the male flowers), in the male flowers inserted in the corolla-tube, in hermaphrodite flowers in its throat. Ovary 3-celled, narrowed into the short style. Fruit globose or ellipsoid, \(\frac{1}{2} \frac{3}{4} \) in. in diam. Fl. B. I. v. 6, p. 429; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 526; Brandis, Ind. Trees (1906) p. 655.—Flowers: Aug.—Nov.

In the Bombay Presidency confined to Sind. Sind: Woodrow, Talbot, Brandis.—Distrib. India (Panjab), Afghanistan

7. CORYPHA, Linn.

Tall, stout, unarmed palms, dying after once flowering and ripening their seed, at the age of between 20 and 40 years. Leaves very large, orbicular or lunate, flabellately multifid, the segments folded lengthwise; petioles stout, concave, spinous at the edges. Flowers small, hermaphrodite. Spadix large, terminal, erect, pyramidally paniculate. Spathes many, tubular. Calyx cupular, 3-fid. Petals 3, connate at the base, ovate, acute, imbricate or subvalvate. Stamens 6; filaments subulate; anthers dorsifixed. Ovary 3-lobed, 3-celled; ovules basilar, erect in each cell; style short, subulate; stigma minute. Fruit usually 1 globose drupe with 2 abortive carpels at the base. Seed creet, globose or oblong; albumen uniform; embryo spiral.—Distrib. Tropical Asia; species 6.

1. Corypha umbraculifera, Linn. Sp. Pl. (1753) p. 1187. Trunk erect, straight, cylindric, 30-80 by 2-3 ft., annulate. Leaves 8-16 ft. in diam., plicate, cleft to about the middle into 80-100 linear-lanceolate acute or 2-fid lobes; petioles 5-10 ft. long, very stout, the margins armed with short, compressed, dark-colored spines. Spadix pyramidal, 10-20 ft. long, decompound, shortly and stoutly pedunculate; peduncles clothed with tubular spathes which are pierced by the primary branches; branches of the spadix forming pendulous spikes. Calyx broadly 3-lobed. Petals oblong, about \(\frac{1}{12}\) in. long. Overy suddenly contracted into the style. Drupe shortly stipitate, globose, 1\(\frac{1}{2}\) in. in diam., with 2 small arrested carpels at its base. Seeds globose, very hard, smooth and

polished. Fl. B. I. v. 6, p. 428; Grah. Cat. p. 224; Dalz. & Gibs. Suppl. p. 94; Griff. Palm. Brit. E. Ind. (1850) p. 116; Trim. Fl. Ceyl. v. 4, p. 328; Talb. Trees, Bomb. ed. 2, p. 343; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 526; Prain, Beng. Pl. p. 1090; Brandis, Ind. Trees (1906) p. 657; Watt, Diet. Econ. Prod. v. 2, p. 575.—Venn. Tâli.

KANARA: moist forests of the Kumpta and Honavar talukus of N. Kanara, covering extensive areas near the Gairsoppa and Yena rivers, also on the Yellapur Gháts; sometimes planted in gardens near the coast, Talbot.—Distrib. India (Andamans, W.

Peninsula); Ceylon; cultivated in Tropical India, Ceylon, and Birma.

The Talipot Palm of Ceylon or the Fan-Palm of S. India, one of the largest and most imposing of Eastern Palms. The young fruit pounded is used for stupefying fish (Trimen). The leaves form mats, fans, and umbrellas (of which latter there is a considerable trade from N. Kanara), and are used for writing on. A kind of bread is made from the pounded soft interior of the trunk. The seeds known as Bajurhet (Talbot) have the hardness of ivory and are used for making beads and buttons and imported into Europe for the latter purpose.

The following non-indigenous palms, not belonging to any of the foregoing genera, are grown as economic or ornamental plants in the Presidency:—

Arcca Catechu, Linn. Sp. Pl. (1753) p. 1189. A graceful slenderstemmed palm; trunk reaching nearly 100 ft. high, scarcely exceeding 1 ft. in diam., green in the upper part, annulate with raised rings which are not quite horizontal but alternately inclined to opposite sides. Leaves pinnate, 4-6 ft. long; leaflets quite glabrous, 1-2 ft. long, with one or several midribs, the upper leaflets confluent. Spadix androgynous, from below the leaves, branched. Lowest spathe large, glabrous, pale straw-colored, parallel-veined. Stamens 6. Fruit 1½-2 in. long, fleshyfibrous, orange or scarlet, supported by the persistent perianth, the seeds in the upper part.

The Supari or Betel-nut Pulm, the original country of which is uncertain (said to be Cochinchina), cultivated but never wild throughout the Presidency, very abundantly in the Sirsi and Siddapur talukas of N. Kanara. The wood is used for a variety of purposes; the sheaths of the leaves are made into hats and also used for writing on. The principal product of the tree, however, is the hard seed, which is chewed by the natives with lime and the leaves of the Piper Betel. Fl. B. I. v. 6, p. 405; Grah. Cat. p. 225; Dalz. & Gibs. Suppl. p. 95; Trim. Fl. Ceyl. v. 4, p. 321; Talb. Trees, Bomb. ed. 2, p. 339; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525; Brandis, Ind. Trees (1906) p. 646; Watt, Dict. Econ. Prod. v. 1, p. 291.—Venn. Supári.

Actinorhytis calapparia, H. Wendl. & Drude, in Linnæa, v. 39 (1875) p. 184. A tall palm with slender smooth grey annulate trunk 60 ft. high by 1 ft. in diam., said to be indigenous in the islands of the Malay in the Supári (Areca) gardens of the Haiga N. Kanara, probably introduced at the same time and along with the Supári. Leaves pinnate, the blade 8 or 9 ft. long by 4½ ft. broad, lanceolate in outline; leaflets 1½-1½ in. broad, linear, acuminate, equally 2-partite. Fruit orange, pendulous, ovoid, of the size of a large egg. Talb. Trees, Bomb. ed. 2, p. 340 (capparia); Woodr. in

Journ. Bomb. Nat. v. 12 (1899) p. 525 (capparia). Areca calapparia, Blume, Rhumph. v. 2 (1836) t. 100, fig. 2. Areca cocoides, Griff. in Calc. Journ. Nat. Hist. v. 5 (1845) p. 454, & Palm. Brit. E. Ind. (1850) p. 150, t. 230, B.—Flowers: Nov.-Jan. Venn. Rám-supári.

Wallichia caryotoides, Roxb. Cor. Pl. v. 3 (1819) p. 91, t. 295. A stemless or short-stemmed palm with pinnatisect leaves, a native of Chittagong and Birma, sometimes grown in gardens. The leaves are 4 ft. long, in tufts from the rhizomes; leaflets fasciculate on the lower part of the petiole, cuneate, lobed, the lobes large præmorse. Fl. B. I. v. 6, p. 419; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 525; Prain, Beng. Pl. p. 1094; Brandis, Ind. Trees (1906) p. 655.

Hyphane thebaica, Mart. Hist. Nat. Palm. v. 3 (1836-1850) p. 225, tt. 131-133. The Doum Palm of Upper Egypt, from which it extends to the equator. Stem terete, 10-30 ft. high, dividing into 3 or 4 branches above the middle. Leaves fan-shaped. When seen from a distance against the sky the upper part looks like the letter W. The tree was, according to Graham, introduced into Bombay by Nimmo in 1828, and again by Maccullough in 1837. It is not very attractive as a garden plant, but there are several specimens in the public park at Baroda and at Poona, while there is a fine tree at Sewree in Bombay. The pulp of the fruit is edible. Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 526, & Gard. in Ind. ed. 5, p. 524. Hyphane coriacea, Grah. Cat. p. 224 (not of Gaertn.); Dalz. & Gibs. Suppl. p. 95.

Livistona chinensis, R. Br. Prodr. (1810) p. 268. A handsome palm, a native of China and Japan, with a stout obscurely annulate trank 20-30 ft. high, and large fan-shaped leaves with long pendulous bipartite divisions, on usually long petioles armed with short recurved spines and rising from a network of brown fibres. The length of the petioles depends on the position in which the plant is grown, being longer in slight shade than in the open. Flowers white, with an unpleasant odor (Griffith). Fruit-bearing spadix nodding, with subsecund branches. Fruit a dull-blue olive-like drupe. The palm is commonly grown in gardens and does well with ordinary border treatment if watered freely during dry weather. Fl. B. I. v. 6, p. 434; Woodr. in Journ. Bomb. Nat. v. 12 (1899) p. 526, & Gard. in Ind. ed. 5, p. 525; Prain, Beng. Pl. p. 1091. Livistona mauritiana, Wall. in Voigt, Hort. Suburb. Calc. (1845) p. 641 (nomen nudum).

Orcodoxa regia, H. B. & K. Nov. Gen. & Sp. v. 1 (1815) p. 305. A fine palm with pinnate leaves 4-6 ft. long, leaflets 6-15 in. long and nearly 1 in. broad, a native of Cuba. The lowest pinna is often produced into a long pendulous whip 3-5 ft. in length which in medium-sized plants furnishes an easy means of identification. Fully developed avenues of this palm are among the chief ornaments of the Botanical Gardens at Culcutta and at Peradeniya (Ceylon), and good specimens may be seen in the Victoria Gardens, Bombay, and at Poona (Woodrow). Dalz. & Gibs. Suppl. p. 95; Woodr. Gard. in Ind. ed. 5, p. 525.

Washingtonia filifera, II. Wendl. in Bot. Zeit. v. 37 (1879) p. 68. A tree 20-40 ft. high, a native of California, with circular flabelliform leaves, the segments separated half-way down and the margins fringed with numerous white threads (hence the specific name). The petioles are armed with stout hooked marginal spines. The tree is of rapid growth and bears the full sun in the dry air of the Deccan, where it may be seen at Poona. Woodr. Gard. in Ind. ed. 5, p. 528.

Licuala peltata, Roxb. Fl. Ind. v. 2 (1832) p. 179. A dwarf palm introduced by Nimmo (fide Graham), a native of Chittagong, Birma, and the Andamans, with a trunk 6-12 ft. high, sometimes thicker in the upper portion owing to the persistent petiole-bases. I leaves nearly orbicular, 3-5 ft. in diam., peltate, horizontal, divided almost to the petiole into 16-20 cuneate segments, plaited and 6-10-toothed at the apex; petiole about 6 ft. long, the sides armed with strong, sharp, smooth, recurved spines. Spadix erect, longer than the leaves, simply branched, densely covered with greenish-white flowers. Drupe ½ in. long, ellipsoid, red. Fl. B. I. v. 6, p. 430; Grah. Cat. p. 225; Woodr. Gard. in Ind. ed. 5, p. 524; Prain, Beng. Pl. p. 1091; Brandis, Ind. Trees (1906) p. 656; Watt, Dict. Econ. Prod. v. 4, p. 639.

Borassus fabellifer, Linn. Sp. Pl. (1753) p. 1187. The Palmyra or Brab Tree, a native of Tropical Africa, cultivated and sometimes selfsown. Trunk attains 100 ft. high and 2 ft. in diam, near the ground, with a dense mass of long rootlets, often swollen above the middle, when young covered with dry leaves or the bases of petioles, when old marked with the black narrow scars of the latter. Leaves 3-5 ft. in diam.; segments 60-80, shining, folded along the midrib, linear-lanceolate: petioles 2-4 ft. long, semiterete, the margins with hard spinescent serratures. Flowers diocious. Spadix very large, simply branched, sheathed with numerous open spathes. MALE FLOWERS small; spikes 1-3 at the ends of the branches, cylindric, densely clothed with imbricating bracts; numerous minute secund spikelets concealed by the bracts so as to appear immersed in the spike, the flowers coming to the surface one by one as they successively open. Stamens 6; filaments connate with the corolla into a stalk. Finale Flowers larger, globose, 1 in. in diam.; perianth fleshy, greatly accrescent. Sepals imbricate. Petals smaller, convolute. Staminodes 6-9. Ovary 3-4-celled. Fruit a large subglobose brown drupe 6 in. in diam. or more, with 1-3 obcordate fibrous pyrenes, enclosed by the enlarged perianth. Seeds oblong, 3-lobed at the top; albumen uniform, hollow. Fl. B. I. v. 6, p. 482; Trim. Fl. Ceyl. v. 4, p. 336; Talb. Trees, Bomb. ed. 2, p. 343; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 427; Prain, Beng. Pl. p. 1092; Brandis, Ind. Trees (1906) p. 657. Borassus flabelliformis, Murr. Syst. ed. 13 (1774) p. 827; Grah. Cat. p. 226; Dalz. & Gibs. p. 278; Watt, Diet. Econ. Prod. v. 1, p. 495 .- Flowers: Mar.-Apr. VERN. Tad; Tádi: Tár.

Cultivated throughout India. Every part of the plant is utilized. A gum is obtained from it; the wood is hard, heavy and durable, and used for water-pipes and channels and for posts, rafters, &c.; the leaves are used for thatching, for mats and for writing on; the cut flower-stalks

yield sugar and when fermented a country liquor; the fruit is roasted and eaten. See Watt, Dict. Econ. Prod. l. c.

Cocos nucifera, Linn. Sp. Pl. (1753) p. 1188. The Cocoa-nut Tree. An unarmed monocious palm. Trunk 40-80 ft. high, annulate. thickened at the base, with a mass of rooflets. Leaves 6-15 ft. long; leaslets equidistant, 2-3 ft. long, linear-lancoolate coriaceous: netioles 3-5 ft. long, stout. Spadix 4-6 ft. long, stout, androgynous, at length drooping, simply panicled; branches bearing scattered female flowers (often between 2 males) towards their bases and numerous males above. Lower spathes 2-3 ft. long, oblong, hard, splitting lengthwise. Mark Petals 1 in. long, oblong, acute, valvate. Stamens 6; filaments subulate; anthers linear erect. Pistillode minute or 0. Female flowers larger than the male, I in. long, ovoid, supported by broad bracteoles. Perianth accrescent. Sepals 1 in. in diam., round, concave, imbricate. Petals shorter than the sepals, convolute, with imbricate tips. Fruit 8-12 in. long, 3gonously obovoid or subglobose, green or yellowish; pericarp thick, fibrous; endocarp bony, with 3 basal pores indicating the 3 cells of the ovary; albumen lining the endocarp, the cavity large, filled with a sweet somewhat milky fluid known as Cocoa-nut milk. Fl. B. I. v. 6, p. 482; Grah. Cat. p. 225; Dalz. & Gibs. p. 279; Talb. Trees, Bomb. ed. 2, p. 342; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 427; Prain, Beng. Pl. p. 1095; Watt, Diet. Econ. Prod. v. 2, p. 415.—Flowers: throughout the year. VERN. Narel.

Planted throughout the Presidency especially near the sea-coast, where it grows better than inland; in fact it is rarely seen at any distance from the coast in Bombay. Its native country is a matter of uncertainty; it is said to be indigenous in Cocos Island and the North Andamaus. The uses to which the Cocoa-nut palm is put are amazingly numerous. In Watt's 'Dictionary of Economic Products' a list is given of various articles prepared from the tree exhibited by Mr. Pereira, Head Assistant to the Medical Storekeeper, Bombay, at the Colonial and Indian

Exhibition.

The articles exhibited numbered no less than S3. The fibrous pericarp yields coir which is used for ropes, mats, &c., and exported largely. The oil from the nuts is an important article of trade, used for burning, cooking, the manufacture of soap, &c. The sap is drawn regularly from the trees and allowed to ferment and used thus as a beverage or afterwards distilled to make arrack.

The ripe cocoa-nuts are largely exported as an article of food. For an exhaustive account of the cocoa-nut industry, see Watt, Econ.

Prod. l. c.

Cocos plumosa, Hook. Bot. Mag. t. 5180. A very graceful palm, a native of Brazil, introduced recently into the Bombay Presidency and well worthy of a place in gardens.

The plant has a straight stem and very long pinnate leaves recurved at the end forming a graceful plume. Woodr. Gard. in Ind. ed. 5,

p. 522.

ORDER CXXXIX. PANDANACEÆ.

Diocious trees or shrubs, sometimes scandent with aerial roots, the stem often forked and supported, as if standing on stilts, by numerous adventitions roots. Leaves corinceous, narrow, acuminate, sessile, with a sheathing base, in tristichous spirals, the edges and midrib usually spinous, the spines on the margins erect, those on the midrib usually retrorse; transverse nerves prominent. Spadix axillary or terminal, simple or branched, clothed with leafly spathes; flowers small, crowded or catkin-like; perianth 0; bracts and bracteoles 0. MALE FLOWERS: Stamens numerous; filaments free or connate; anthers erect, basifixed. Pistillode small or obsolete. Female flowers: Staminodes small or 0. Ovary 1-celled, free or connate with those of contiguous flowers in phalanges of 2 or more; ovules solitary and subcrect, or many and parietal; stigmas subsessile, papillose. Fruit a syncarpium, consisting of numerous more or less obconic drupes, the apex of each drupe or carpel distinct, pyramidal, conical or convex, crowned by the hardened style or stigma. Seeds minute; testa striate; albumen abundant, hard and oily; embryo minute.—DSTRIB. Tropical Asia, Africa, Australia, Polynesia, Malay Peninsula and Archipelago, New Zealand; genera 2; species about 200.

1. PANDANUS, Linn. f.

Palm-like small trees or shrubs; stems sometimes very short, erect, or procumbent and rooting. Leaves long, spirally arranged at the ends of the branches, sheathing at the base. Flowers dieccious. Male flowers: Spadix compound, with numerous yellow or white keeled spathes. Stamens numerous, single or united into bundles on the spadix; filaments short or long; anthers sessile, elongate, 2-celled. Fimale flowers: Spadix simple, protected by leafly spathes. Staminodes 0. Ovary of 1 or several 1-celled carpels, free or connate; ovule solitary in each cell, ascending from the base of a parietal placenta. Fruit an oblong syncarpium, usually solitary, of woody or fleshy thick-walled drupes, which are deciduous singly or in masses from a fleshy receptacle, the upper half of each carpel hollow or filled with a spongy pith-like tissue. Seeds large, strophiolate; albumen fleshy; embryo small; radicle inferior.—Distata. Asia, Tropical Africa, Australia, and Polynesia; species about 150.

1. Pandanus furcatus, Roxb. Hort. Beng. (1814) p. 71. A small gregarious tree with trunk 10-30 ft. high, by 6 in. in diam. (in the Bombay Presidency only a sprending bush), branched, with aerial roots from the lower part of the trunk. Leaves dark green, 8-15 ft. long by 3-6 in. wide, with short stout sharp spines on the margins and midrib. MALE FLOWERS in compound cylindric spikes 4-6 in. long by $\frac{2}{4}$ - $1\frac{1}{4}$ in. broad, densely floriferous. Spathes golden yellow, inodorous, the lowest

- reaching 2½ ft. long by 4 in. wide, produced at the apex into a spinulose 3-quetrous acumen. Staminal-column ½ in. long with 3-5 stamens fascicled at the apex; filaments short; anthers ½ in. long, linear, mucronate. Female flowers: Syncarpium usually solitary, subtrigonous, orange-red when fully ripe, 6-9 in. long, variable in size; drupes obconic with a convex crown; styles deeply 2-3-forked, shining, spinulose. Fl. B. I. v. 6, p. 484; Dalz. & Gibs. p. 279; Talb. Trees, Bomb. ed. 2, p. 345; Warburg, in Engl. Pflanzenreich, v. 4, part 9 (1900) p. 75; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 427; Prain, Beng. Pl. p. 1101; Brandis, Ind. Trees (1906) p. 659; Watt, Dict. Econ. Prod. v. 6, part 1, p. 4.—Flowers: cold and hot seasons.
- S. M. Country: between Belgaum and Ramghat, Dalzell & Gilson; common in the Ghat forests of Belgaum, Talkot. Kanara: forming dense almost impenetrable thickets in marshy places near watercourses, Talkot.—Distrib. India (hills of Khasia and Manipur, Chittagong, Birma, W. Peninsula); Malay Peninsula and Archipelago.
- 2. Pandanus tectorius, Soland. ex Parkinson, Journ. Voy. H.M.S. Endeavour, p. 46 (1773). Shrubby, up to 20 ft. high, rarely erect; stem supported by aerial roots. Leaves glaucous green, 3-5 ft. long, ensiform, caudate-acuminate, coriaceous, the marginal spines pointing forward, those on the midrib pointing forward or backward. MALU PLOWERS: Spadix with numerous subsessile cylindric spikes 2-4 by 1-1; in., enclosed in long white fragrant caudate-acuminate Staminal-column $\frac{1}{4}$ in. long; anthers longer than the slender filaments, cuspidate, inserted along the whole length of the upper portion. FEMALE PLOWERS: Spadix solitary, 2 in. in diam. Carpols confluent in obpyramidal groups of 6-10 or fewer: stigmas short, reniform, yellow. Fruit an oblong or globose syncarpium, 6-10 in. long and broad, yellow or red; drupes numerous (50-60), each consisting of 5-12 carpels; carpels 2-3 in. long, turbinate, angular, the crown smooth, convex, more or less depressed round the reniform stigmas. Warburg, in Engl. Pflanzenreich, v. 4, part 9 (1900) p. 46; Brandis, Ind. Trees (1906) p. 659. Pandanus odoratissimus, Linn. f. Suppl. (1781) p. 424; Grah. Cat. p. 227; Dalz. & Gibs. p. 279; Trim. Fl. Cevl. v. 4, p. 339; Watt, Diet. Econ. Prod. v. 6, part 1, p. 5. P. fascicularis, Lam. Encyc. Method. v. 1 (1783) p. 372; Hook. f. Fl. B. I. v. 6, p. 485; Talb. Trees, Bomb. ed. 2, p. 345; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 427.—Flowers: hot and rainy seasons. VIRN. Keura.

KONKAN: in sandy places near the sea-coast, Talbot.—Distrib. Sea-coast of the Indian Peninsula on both sides, Sundribans, Birma, Andamans; often planted and known as the Sector Pine.

Pandanus Candelabrum, Beauv. Fl. Ow. v. 1 (1804) p. 37. Van. variegata, Hort. ex Nicholson, Dict. Gard. v. 3, p. 16, fig. 17. A native of Java, often grown in gardens, where it is very ornamental if in an isolated position where its gracefully disposed leaves may be seen to advantage. The leaves are 3-6 ft. long by about 4 in. wide, gradually tapering to a fine point, armed with white spines on the margins which point forward, the spines on the back of the midrib pointing partly

forward and partly backward. The ground-color of the leaves is bright green with bands of white extending from the base to the apex. It is a plant of great beauty, growing well in sandy soil if abundantly watered. Pandanus javanicus var. variegata, Hort. ex Nicholson, Dict. Gard. v. 3, p. 17; Woodr. Gard. in Ind. ed. 5, p. 529.

Pandanus labyrinthicus, Kurz, in Miq. Ann. Mus. Bot. Lugd. Bat. v. 2 (1866) p. 53. A shrub 10-20 ft. high, a native of Sumatra; stem bearing a crown of leaves, branched, erecto-patent, sending out intricate aerial roots on every side. Leaves about 3 ft. long by 1½ in. wide, very acute, glaucescent beneath, spiny on the margins and the apex of the keel. Fruit scarlet when ripe, oblong-ellipsoid, reaching 4 in. long. Bot. Mag. t. 7063; Nicholson, Dict. Gard. Suppl. p. 580. Pandanus ceramicus, Woodr. Gard. in Ind. ed. 5, p. 530.

ORDER CXL. TYPHACEÆ.

Aquatic or palustrine perennial herbs. Leaves linear, erect or floating, sheathing below; nerves parallel. Flowers small, monocious or, by abortion, diocious, small or minute, densely crowded in globose or cylindric 1-sexual bracteate spikes the upper flowers of which are males; bracteoles 0. Perianth of membranous, green scales or slender hairs. Madd flowers: Stamens 1-7; filaments free or connate; anthers basifixed, erect, cuneate or linear-oblong, dehiscing longitudinally; connective sometimes produced. Pistillode 0. Female flowers: Ovary superior, 1-2-celled, the cells 1-ovulate; ovules pendulous from the top of the cell; styles free, short or long, persistent, laterally papillosely stigmatic. Fruit small, membranous or drupaceous. Seeds pendulous; albumen fleshy or floury; embryo axile, cylindric, the radical end thickened; plumule in a lateral slit.—Distrib. Genera 2; species about 15, cosmopolitan.

1. TYPHA, Linn.

Marsh herbs. Leaves erect, spongy. Flowers small, in very dense superposed cylindric spikes, often intermixed with hairs with dilated tips. Perianth of capillary hairs or in the male flowers obsolete. Stamens 1 or more; connective thickened at the tip. Ovary often reduced to a clavate-tipped hair, long-stalked, narrowed into a capillary style; with a clavate or filiform stigma. Fruit very minute; pericarp membranous, indehiscent or follicular. Seed with striate testa; albumen floury.—Distrib. Temperate and tropical regions; species about 10.

1. Typha angustata, Bory & Chaub. Exp. Sci. Morée, Bot. v. 1 (1832) p. 338. A robust plant; stem 5-10 ft. high. Leaves exceeding the flowering stem, $\frac{3}{4}$ -1 in. broad, semicylindric above the sheath. Spikes cylindric, the male and female spikes often separated by a considerable interval, the female spikes pale brown, $\frac{1}{4}$ - $\frac{7}{8}$ in. in diam. Female flowers mixed with clavate-tipped pistillodes; bracteoles subspathulate, equalling the linear stigmas, both longer than the hairs. Pollen simple. According to Aitchison (Bot. Afghan Delim. Comm. in Trans. Linn. Soc. N.S. v. 3 [1887] p. 120) the species sometimes

bears male and female flowers on different plants. Fl. B. I. v. 6, p. 489; Bory & Chaub. Nouv. Fl. Pélop. (1838) p. 4; Boiss. Fl. Orient. v. 5 (1881) p. 50; Aitch. in Trans. Lunn. Soc. New Series, v. 3 (1887) p. 120; Graebner, in Engl. Pflanzenreich, v. 4, part 8 (1900) p. 14; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 427; Prain, Beng. Pl. p. 1102. Typha angustifolia, Sibth. & Sm. Fl. Gree. Prodr. v. 2 (1813) p. 226 (not of Lunn.); Roxb. Fl. Ind. v. 3 (1832) p. 567; Watt, Diet. Econ. Prod. v. 6, part 4, p. 207. Typha elephantina, Grah. Cat. p. 227 (not of Roxb).—Flowers: Aug. Venn. Pan-kanis; Pun; Jangli-bajri.

Diccan: Gibson ex Graham; Poona, Cooke!, Woodrow, Sind: Stocks, 5421-Distrib.

More or less throughout India; N. Asia, N. Africa.

Mats, screens, &c. are made of the reed in Sind and a curious yellow called substance called Bur is made of the flowers and is much eaten by all classes of natives in Sind (Stocks).

Typha clephantina, Roxb. Fl. Ind. v. 3 (1832) p. 566, does not appear to be indigenous in the Bombay Presidency. Woodrow (Journ, Bomb. Nat. v. 13 [1901] p. 427) says that it is planted in Bombay, no doubt as an ornamental plant. The leaves are broad, which is sheath, and the pollen is 4-globate. Graebner, in v. 4, part 8 (1900) p. 11.

ORDER CXLI. ARACEÆ.

Herbs usually glabrous (rarely armed), with watery, acrid, or milky juice, stemless or with a short stock or corm or tuber; or shrubs with sympodial branches, climbing by aerial roots. Leaves in shrubby species alternate, distrebous or spiral; in herbaceous species few, clustered or solitary, radical sometimes appearing without or after the flowers; petiole with a sheathing base; blade entire or lobed or pinnale or perforate, often with entaphyllaries at the base of the leaf-sheaths. Flowers 1-sexual or hermaphrodite, sessile on a spadix which is more or less completely enclosed in a green or colored spathe; when 1-sexual, usually monocious (rarely diocious) with males towards the apex and females at the base of the spadix, often with neuters between them and sometimes with neuters above the males. Perianth 0, or of a few scales (rarely cupular or urceolate). Stamens in hormaphrodite flowers 4-8, in male flowers 1 or more, distinct or confluent; anthers 2-4-celled, free or (in confluent stamens) connate by means of the thickened connective, the cells discrete or contiguous, free or buried in the connective and opening by a terminal pore frar dy by a length direct slit); pollen globose or ellipsoid, powdery or combineral. sessile, 1-3-celled; ovules in each cell 1 or more, harder, opening the or parietal; style short or long; stigma discoid or lobed. Fruit of many small free or connate berries or drupes adnate to the spadiv. Seeds in each drupe or berry 1 or few (rarely many), small or large, usually embedded in a mucilaginous pulp; albumen copious or 0; embryo axile or in exalbuminous genera thick, with the plumule in a lateral slit.—DISTRIB. Genera about 100; species about 1000, chiefly tropical.

VERTEBRATES.

MÁMMALIA. By W. T. Blanford.

Pp. i-xx, 1-617, and 199 woodcuts. Price £1.

BIRDS. By E. W. Oates and W. T. Blanford.

I., pp. i-xx, 1-556, and 163 woodcuts. Price £1. Vor. II., pp i-x, 1-407, and 107 noodcuts. Price 15s.

Vot. III., pp. 1-xiv, 1-450, and 102 nonleuts. Price 15s.

Vol. IV., pp. i-xxi, 1-500, and 127 woodcuts. Price 15s.

By Francis Day. FISHES.

> Vol. I., pp. i-xxviii, 1-548, and 164 woodcuts. Price £1. Vol. II., pp. i-xiv, 1-510, and 177 woodcuts. Price £1.

REPTILIA AND BATRACHIA. By G. A. Boulenger. Ph. i-xviii, 1-541, and 142 woodcuts. Price £1.

UNIFORM WITH THE ABOVE.

INVERTEBRATES.

BUTTERFLIES. By Lieut.-Col. Bingham.

Vos. I., pp. i-xxii, 1-511, 10 coloured plates and 94 woodcuts. Price $\pounds 1$.

Von. II., pp. i-viii, 1-480, 10 coloured plates and 104 woodcuts. Price £1.

MOTHS. By Sir G. F. Hampson.

Vol. 1., pp. i-xxiii, 1-527, and 333 woodcuts. Price £1. Vol. II., pp. i-xxii, 1-608, and 325 woodcuts. Price £1.

Vol. III., pp. i-xxviii, 1-546, and 226 woodcuts. Price £1.

Vol. IV., pp. i-x viii, 1-594, and 287 woodcuts. Price £1.

HYMENOPTERA. By Lieut.-Col. Bingham.

Vol. I., pp. i-xxix, 1-579, 4 coloured plates and 189 woodcuts. Price £1.

Vot. II., pp. i-xx, 1-506, 1 coloured plate and 161 woodouts. Price £1.

ARACHNIDA. By R. I. Pocock.

Pp. i-xii, 1-270, and 89 woodcuts. Price 10s.

RHYNCHOTA. By W. L. Distant.

Vol. I., pp. i-xxxvin, 1-438, and 256 woodcuts. Price £1.
Vol. II., pp. i-xvii, 1-503, and 319 woodcuts. Price £1.
Vol. III., pp. i-xiv, 1-502, and 260 woodcuts. Price £1.

Vot. IV., pp. i-xvi, 1-502, and 282 woodcuts. Price £1.

COLEOPTERA. By C. J. Gahan.

Vol. I., pp. i-xviii, 1-329, and 107 woodcuts. Price 10s.

MOLLUSCA. By the late W.T. Blanford and Lieut. Col. Godwin-Austen.

Pp. i-xxii, 1-312, and 90 woodcuts. Price 10s.

LONDON:

TAYLOR AND FRANCIS, RED LION COURT, FLEET STREET.

Flowers 1-sexual, monocious (often diocious in Arisama).	
Water or marsh plants; spadix without a barren	
appendage.	
Floating stemless herbs; leaves sessile in a resette-	
like tuft	1. Pistia.
Submerged, aquatic or marsh herbs.	
Ovaries in one whorl	2. Chyptoconyne.
Ovaries spirally arranged	3. LAGENANDRA.
Terrestrial tuberous herbs.	
Spadix with a barren terminal appendage; ovules	
not parietal.	
Male flowers stipitate; flowers often diocious.	4. Arisæma.
Male flowers sessile or nearly so; flowers	
always monocious.	
Flowers and leaves present together.	~ ~
Orules 1-2, basal	5. Typnonium.
Ovules many, basal and apical	6. Theriophonum.
Flowers appearing before the leaves.	
Ovules orthotropous; males and	
females remote; neuters present	- n
above the females	
Orules anatropous; males and	
females contiguous; neuters 0	8. Anorphophallus.
Spadix without a barren appendage; ovules many,	
parietal.	
Female inflorescence adnate to base of spathe;	0 1
stigma stellate	9. ARIOPSIS.
spanix free from the spathe; stigma discoid.	10. REHUSATIA.
Flowers hermaphrodite; stem scandent; spathe small	II. TOTHOS.

1. PISTIA, Linn.

A floating gregarious monœcious stoloniferous herb. Leaves sessile in a close spiral, obovate-cuneate, together forming a cup; veins parallel; stipulary sheaths small, membranous. Spathe small, shortly pedunculate, tubular below, open above; tube short; limb ovate, concave, spreading. Spadix adnate to the back of the tube of the spathe, free above. Male inflorescence a whorl of a few sessile connate stamens below the apex of the spadix, with a whorl of minute neuters below it; anther-slits vertical. Female inflorescence a solitary oblong 1-celled ovary, obliquely adnate to the spadix for nearly its whole length, the tip free, forming a conical style with a discoid stigma; ovules many, crowded on a parietal placenta, orthotropous. Fruit ovoid; pericarp thin, bursting irregularly. Seeds many, oblong or obovoid; testa ultimately rugose; albumen copious, floury; embryo minute, apical, cuneiform.—Distairs. Species 1, tropical.

1. Pistia Stratiotes, Linn. Sp. Pl. (1753) p. 963. A floating stemless stoloniferous herb with a peculiar muriatic odor; roots of tufted simple white fibres clothed with fibrillæ. Leaves 1¼-4 in. long, variable in breadth, obovate-cuneate, rounded or retuse at the apex, densely and closely pubescent on both surfaces; nerves few or many, flabellately arranged, converging within the margin. Spathe about ½ in. long, obliquely campanulate, white, gibbous and closed below, contracted about the middle, dilated and nearly orbicular above.—Distributed about India and Ceylon and the tropics generally. Fl. B. I. v. 6, p. 497; Grah. Cat. p. 200; Dalz. & Gibs. p. 281; Roxb. Cor. Pl. v. 3 Tol. II.

(1819) p. 64, t. 268; Trim. Fl. Ceyl. v. 4, p. 345; Woodr. in Journ, Bomb. Nat. v. 13 (1901) p. 427; Prain, Beng. Pl. p. 1105; Watt, Dict. Econ. Prod. v. 6, part 1, p. 275.—Flowers: July-Nov.

Common in tanks throughout the Presidency.-Distrib. of the genus.

2. CRYPTOCORYNE, Fisch.

Herbs usually marsh or aquatic; stem short or 0 or a creeping root-stock. Leaves narrow or broad. Spathe tubular with connate margins and a transverse septum within below. Spadix very slender, its tip adnate to the septum of the spathe. Mald inflorescence cylindric. Stamens 1-2, distinct; anthers short, sessile, truncate, cells 2 with conic perforate tips, pollen vermiform. Finally inflorescence a single whorl of connate 1-celled ovaries with a few neuters; ovules many, erect, orthotropous; styles short, recurved. Fruit a fleshy syncarpium, of connate, coriaceous, many-seeded carpels, the valves stellately spreading. Seeds oblong; testa rugose; albumen copious; embryo axile; plumule sometimes germinating in the fruit.—Distrib. Species 26, tropical Asiatic.

1. Cryptocoryne retrospiralis, Kunth, Enum. v. 3 (1841) p. 12. An herb usually submerged; root of fleshy fibres, stem 0. Leaves numerous, radical, 3-18 by \(\frac{1}{4} - \frac{3}{4} \) in., narrowly linear or linear-lanceolate, sessile or with a short stout petiole, acute or finely acuminate; midrib slender. Spathe subsessile, nearly as long as the leaves, deep green streaked with purple; tube narrow, longer than the limb, not or scarcely twisted; limb glabrous, closely twisted. Ovaries 5-6; ovules 3 or more; stigmas orbicular. Fl. B. I. v. 6, p. 493; Wight, Icon. t. 772; Engler, in DC. Monog. Phan. v. 2 (1879) p. 625; Engler, in Engl. & Prantl, Pflanzenf. v. 2, part 3 (1889) p. 152, fig. 99 A-C; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 427; Prain, Beng. Pl. p. 1105. Cryptocoryne Roxburghii, Dalz. & Gibs. Bo. Fl. (1861) p. 259 (not of Schott).

Konkan: Bombay, Law!; banks of the Pen River, Law!; beds of rivers in the Konkan, Gibson!; bed of the river near Mira, Gibson, 151! Deccan: Poons on river banks, Ranade!, Woodrow.—Distrin. India (Bongal, Behar, Birma, W. Peninsula).

2. Cryptocoryne spiralis, Fisch. in Linnaa, v. 5 (1830) p. 428. A small grass-like herb growing on the margins of ditches and ponds, submerged during the rainy season only. Rootstock tuberous, soboliferous; roots vermiform. Leaves 3-8 by \frac{1}{2}-\frac{2}{3}\ in., linear-lanceolate, acute or acuminate, narrowed from the middle to both ends; nerves nearly parallel; petiole short, stout. Spathe subsessile, 3-5 in. long; tube very short, much shorter than the limb, linear-lanceolate, at first twisted, greenish outside, dark purple and transversely lamellate within. Ovaries 5-6; stigmas broadly elliptic. Fl. B. I. v. 6, p. 494; Wight, Icon. t. 773; Engler, in DC. Monog. Phan. v. 2 (1879) p. 628, and in Engl. & Prantl, Pflanzenf. v. 2, part 3 (1889) p. 152, fig. 99 D-G; Trim.

Fl. Ceyl. v. 4, p. 346; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 427; Prain, Beng. Pl. p. 1105. Arum spirale, Retz. Obs. fasc. 1 (1779) p. 30; Bot. Mag. t. 2220; Grah. Cat. p. 228.

KONKAN: Dalzell I, Stocks !- DISTRIB. India (Bougal, W. Peninsula).

3. Cryptocoryne cognata, Schott, in Bonplandia, Jahrg. 5 (1857) p. 222. Root bulbous, with vermiform fibres. Leaf-blade 6-10 by $\frac{7}{6}-1\frac{1}{2}$ in., oblong-lanceolate, narrowed and acute at both ends, the margins undulate; midrib very broad; petioles stout, shorter than or equalling the blade. Spathe reaching 7 in. long, shortly pedunculate; limb much longer than the tube, narrowed into a long tail which (in the Kew specimens at least) is not twisted; tube of spathe reaching 2 in. long. Male inflorescence separated from the female by an interspace of about $1\frac{1}{4}$ in. Fl. B. I. v. 6, p. 494; Engler, in DC. Monog. Phan. v. 2 (1879) p. 629; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 427.

There are but 2 sheets in Herb. Kew., the specimens on both of which are from the Konkan, one collected by Stocks, the other by Law.—Distrib. India (W. Peninsula).

DOUBTFUL SPECIES.

CRIPTOCORINE DALZELLII, Schott, in Bonplandia, Jahrg. 5 (1857) p. 221. This singular plant, of which Dalzell says he can make nothing, is represented in Morb. Kew. by half a sheet of specimens, chiefly of fruit in various stages, and a drawing. Dalzell says in a note attached to the sheet: "The leaf is lanceolate, without petiole and apparently amplexicaul, the margin transparent and finally crenated; veins parallel; surface woolly as if covered densely with cobweb. No stamens; no ovarium; nothing but what is observed in the drawing. The perianth is fleshy and what appears as the pedicel is solid." The fruit is ovoid, about \(\frac{1}{2} \) by \(\frac{1}{2} \) in on a solitary stalk. The seeds are 2-seriate, oblong, subtrigonous. The sheet is marked "Bombay, Dalzell," without further information as to locality. Fl. B. I. v. 6, p. 495; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 427.

EXCLUDED SPECIES.

CRYPTOCORYNE UNILOCULARIS, Kunth, Enum. v. 3 (1841) p. 13; Wight, Icon. t. 774; Jackson, Index Kewen. v. 2, p. 661. Cryptocoryne Roxburghii, Schott, Prodr. Syst. Aroid. (1860) p. 18; Dalz. & Gibs. p. 257; Engler, in DC. Monog. Phan. v. 2 (1879) p. 629. Ambrosinia unilocularis, Roxb. Fl. Ind. v. 3 (1832) p. 493.

I can find no evidence of the occurrence of this (a Coromandel plant) in the Bombay Presidency. Dalzell [Bo. Fl. (1861) p. 257] mentions the plant as common, but he has supplied no specimens of it, and I am of opinion that the plant he has described (l. c.) as C. Roxburghii is C. retrospiralis, Kunth, of which there are specimens at Kew from the Koukan and Deccan. There is not a single specimen in Herb. Kew. of Roxburgh's plant, nothing but a drawing, and 1 believe that no specimen is extant. The plant noticed in Woodrow's list from Poona proves to be C. retrospiralis.

3. LAGENANDRA, Dalz.

Aquatic herbs with the characters of *Cryptocoryne*, but with many ovaries in close cycles at the base of the spadix.—DISTRIB. Species 5, India and Ceylon.

1. Lagenandra toxicaria, Dalz. in Kew Journ. Bot. v. 4 (1852) p. 289. Rootstock reaching 2 in. thick, creeping, simple, coriaceous, annulate; root-fibres vermiform. Leaves 6-15 by 2-5 in., elliptic-

oblong, obtuse or acute, margins undulate, entire, base acute or rounded: midrib very stout, with many slender veins diverging from it; petiole as long as the blade, semicylindric, ½ in. in diam.; stipular sheaths acuminate, 2-keeled. Peduncle shorter and more slender than the petiole, compressed. Spathe 3-9 in. long, tubular below; the limb 3-11 in. broad, ovate-lanceolate, caudate-acuminate, slightly twisted: tube much shorter than the long-tailed limb. Male inflorescence cylindric; anthers crowded, yellow, the cells with tubular tips. Female inflorescence of many ovaries, in many cycles, crowded in a globose head; stigma sessile, pulvinate, 5-angled; ovules 4-8 on a basal placenta. Syncarpium on a short decurved peduncle, globose, 12-2 in. in diam.; carpels about & in. long, partially dehiscent. Seeds & in. long, narrowly oblong, furrowed. Fl. B. I. v. 6, p. 495; Dalz. & Gibs. p. 257; Engler, in DC. Monog. Phan. v. 2, p. 621; Trim. Fl. Ceyl. v. 4, p. 349; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 427.—Flowers: Feb.-Mar. Veny. Vatsanáb.

Konean: in marshes, Dalzell. S. M. Country: Belgaum, Dalzell. Kanara: Koessi (N. Kanara), Talbot, 1813!--Distrib. India (W. Peninsula); Ceylon.

4. ARISÆMA, Mart.

Tuberous monocious or diocious herbs. Leaves 1-3, often coming up with the flowers but sometimes after them, trisect or pedate or verticillately 5- or more-sect. Spathe deciduous; tube convolute; limb often acuminate or tailed, usually incurved. Spadix included or exserted, always with a barren appendage which is often long and filiform. MALE INFLORESCENCE of many usually stipitate connate stamens; anthers 2-5, oblong or subglobose, the cells distinct or confluent, dehiscing by pores or vertical slits. Female infloresoence: Flowers densely crowded; ovary ovoid, oblong or subglobose, 1-celled; ovules 2 or more, basal, orthotropous; style short or 0. NEUTER FLOWERS 0 or few, subulate, above the males or the females or on the appendage. Fruit a 1- or few-seeded berry. Seeds ovoid or globose; testa rather thick; albumen copious; embryo axile.—Distrib. Temperate and tropical Asia; N. America; species about 50.

Leaves pedatisect; appendage of spadix elongate, far-exserted. 1. A. tortuosum. Leaflets whorled.

Leaflets sessile.

Spathe 4-12 in. long with an obtusely acuminate tip; tube narrow, petiole 2 ft. long; peduncle short; appendage narrowly clavate Spathe 3-5 in. long with an acute (not caudate) tip; tube wide; petiole 1 ft. long; peduncle 1 ft. long; appendage tapering from the base to the tip Leaflets petiolate with thread-like tips which are 1-3 in. long; spathe 6 in. long with a caudate tip 3 in. long; petiole 10-14 in. long

2. A. Leschenaultii.

3. A. Murrayi.

4. A. caudatum.

1. Arisæma tortuosum, Schott, in Schott & Endlich. Meletem. (1832) p. 17. A tall plant reaching 3 ft. high; tubers spheroidal, up to 4 in. in diam. Leaves 2-3, pedatipartite; petioles 1-3 ft. long, the sheaths often mottled with purple; leaflets sessile or petiolate, 4-8 in. long, of variable breadth, ovate-lanceolate or linear-lanceolate, subcaudately acuminate, distant or crowded or almost radiately arranged. Peduncle 2-4 ft. long. Spathe 4-6 in. long, green outside; tube about as long as the limb, subcylindric, gaping, gradually dilating into the limb, pale purplish inside; limb ovate or ovate-oblong acuminate, broadly cymbiform, incurved. Spadix 1- or 2-sexual; male flowers stalked; appendage very long, much exserted, tapering, like a rat's tail, quite smooth, usually erect at first, then porrect, and again erect. Ovaries ovoid, attenuated into a short style. Berry 4-5-seeded. Fl. B. I. v. 6, p. 502; Engler, in DC. Monog. Phan. v. 2 (1879) p. 545; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 427; Prain, Beng. Pl. p. 1106; Watt, Dict. Econ. Prod. v. 1, p. 312. Arisama curvatum, Dalz. & Gibs. Bo. Fl. (1861) p. 258 (not of Kunth); Hook. in Bot. Mag. (1871) t. 5931.

KONKAN: Stocks!; Western Ghats, Woodrow,-Distrin, India (Manipur, Sikkim-Himalaya, Bengal, W. Peninsula).

2. Arisæma Leschenaultii, Blume, Rumphia, v. 1 (1835) p. 93. Monœcious or diœcious; tubers 2 in. in diam., globose; roots from the upper side of the tuber. Leaf solitary; petiole stout, 2 ft. long, usually mottled and banded with red and brown; leaflets 5-11, whorled, 4-6 by 1½-2½ in., sessile, lanceolate, caudate-acuminate, dark green above, paler beneath, base tapering; midrib stout. Peduncle short. Spathe 4-12 in. long, dark green, striped externally with purple; tube as long as the limb, cylindric, narrow, ribbed, erect, gradually dilated into the limb; limb slightly decurved, ovate-lanceolate, cymbiform, terminating in a straight obtusely acuminate tip of variable length. Spadix shorter than the spathe, about 3 in. long, gradually passing into a very narrowly clavate pale-green smooth appendage with a rounded, sometimes verruculose tip. Anthers 3-4-nate, sessile, with a few subulate neuters above them. Ovaries many, minute, densely crowded. Fl. B. I. v. 6, p. 504; Engler, in DC. Monog. Phan. v. 2 (1879) p. 552; Trim. Fl. Ceyl. v. 4, p. 352; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 427; Watt, Dict. Econ. Prod. v. 1, p. 311. Arum erubescens, Dalz. & Gibs. Bo. Fl. (1861) p. 258 (not of Schott).

KONKAN: Western Gháts, Woodrow. S. M. COUNTRY: between Ráughát and Belgaum in the rains, Dalzell & Gibson.—Distrib. India (Nipal, Khasia Hills, W. Peninsula); Ceylon.

3. Arisæma Murrayi, Hook. in Bot. Mag. (1848) t. 4388. Tubers of the size of small potatoes with root-fibres from the upper side. Leaf solitary, coming up after the flowers, peltate, divided to the base into 5-10 ovate-lauceolate acuminate segments 3-6 by 1-2 in.; petiole reaching 12 in. long. Peduncle 6-10 in. long, slender, reddish, round, smooth, coming up before the leaves. Spathe striate, 3-5 in. long, green at the base, forming a wide tube for more than \(\frac{1}{3} \) its length; limb ovate, convex, acute, somewhat cucullate, pure white with a purple base. Spadix narrowed from the base upwards; appendage curved, narrowed from the base to the tip, included or exserted. Male flowers scattered, with a few neuters above them. Ovaries numerous, crowded, bright red when ripe, variously compressed. Heads in fruit conical. Fl. B. I. v. 6, p. 507; Dalz. & Gibs. p. 258; Engler, in DC. Monog. Phan. v. 2 (1879) p. 552; Woodr. in Journ. Bomb. Nat. v. 13 (1901)

p. 428; Watt, Diet. Econ. Prod. v. 1, p. 312. Arum Murrayi, Grah. Cat. Pl. Bo. (1839) p. 229.—Flowers: May-July. Venn. Sapacha Kánda (i. e. Snake root).

Кочкан: Stocks!; Matheran, Cooke! Drican: Mahableshwar, Cooke!, Graham, Dalzell & Gibson; Sinhagad, Woodiow; Purandhar, Bhira!; Khandala, Bhira! Gujarat: Bansda Hill S.W. of Surat, Law.—Distais. India (W. Peninsula).

Very common at Mahableshwar, where it is known to the residents as the Cobraor Snake-Lily. It appears about the end of May or beginning of June all over the hill, its white flowers without leaves being conspicuous objects throughout the woods. It is equally common at Matheran.

4. Arisæma caudatum, Engler, in DC. Monog. Phan. v. 2 (1879) p. 559. Tuber depressed-globose. Leaf solitary; petiole stout and as well as the peduncle barred and streaked; leaflets 7, petiolulate, 5 by 2 in. (exclusive of the thread-like tips), cuneately elliptic, acuminate and with long capillary tips 1-3 in. long. Peduncle very short. Spathe 6 in. long (not including the 3 in. caudate tip); tube elongate, cylindric; limb incurved, ovate-lanceolate, rather abruptly narrowed into a very long subulate tail; margins below recurved. Spadix androgynous; appendage included, shorter than the flowering portion, not thickened below, the tip rounded. Fl. B. I. v. 6, p. 508; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 428.

Konkan: Stocks (Icon. in Herb. Kew.)!

The description given above is that of Sir Joseph Hooker, made from a drawing by Stocks which is in Herb. Kew. There are no specimens of the plant in Herb. Kew. Engler (l. c.) says that he has seen one brilly dried specimen.

5. TYPHONIUM, Schott.

Tuberous herbs. Leaves entire, or 3-5-lobed, or pedatisect. Flowers monocious. Tube of spathe short, convolute, with a constricted mouth, persistent; limb of spathe ovate-oblong, lanceolate, or linear, deciduous. Spadix usually exserted, with a long smooth barren appendage. Male and female inflorescences distant, with neuters above the females and sometimes also below the males. MALE INFLORESCENCE: Stamens 1-3; anthers subsessile, the cells contiguous, opening by pores or chinks; pollen globose. Female inflorescence: Ovary 1-celled; placenta basal; ovules 1-2, erect; stigma sessile. Fruit of evoid 1-2-seeded berries. Seeds globose; albumen copious; embryo axile.—Distrim. Tropics of the Old World; species about 17.

Leaves bearing bulbs; neuters above the female inflorescence 1. T. bulbiferum. Leaves not bearing bulbs, neuters above the female inflorescence clavate or obovoid

2. T, cuspidatum,

1. Typhonium bulbiferum, Dalz. in Kew Journ. Bot. v. 4 (1852) p. 113. A small plant 4-8 in. high; tuber 1-1 in. in diam. Leaves triangular-hastate, sagittate or cordate, 2-4 in. long and often as broad across the lobes, the angles acute; petiole 5-6 in, long, slender, usually with a pisiform tuber at the top. Peduncle $1-2\frac{1}{2}$ in, long. Spathe slender, pale rose-colored, 3-5 in. long, convolute; tube 3-2 in. long. Spadix as long as the spathe, slender, yellow; appendage filiform. Neuters above the female inflorescence linear, erect, yellow. Anthers

sessile, dehiscing by a terminal pore. Pollen rosy, hispid. Style 0. Fl. B. I. v. 6, p. 511; Dalz. & Gibs. p. 258; Engler, in DC. Monogr. Phan. v. 2 (1879) p. 611; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428; Watt, Dict. Econ. Prod. v. 6, part 4, p. 208.

KONKAN: Stocks!; S. Konkan, Dalzell, Woodrow .- Distrib. India (W. Peninsula).

2. Typhonium cuspidatum, Decaisne, in Nouv. Ann. Mus. Par. v. 3 (1834) p. 367. Tuber 3-1 in. in diam., subglobose. Leaves 2-4½ in. long, of variable width, hastately or cordately oblong or lanceolate, acuminate; basal lobes short, subacute; sinus narrow or open; petiole 4-10 in. long. Peduncle slender, long or short. Spathe 4-7 in. long (including the tail), the lower portion lanceolate, produced into a slender tail which reaches as much as 5 in. long. Spadix shortly stipitate; appendage produced into a long filiform tail and as long as or longer than the spathe. Male inflorescence ¼ in. long, cylindric; female shortly cylindric. Neuters above the female inflorescence clavate or obovoid, purple-headed, those above the male subulate, white. Anthers minute, yellow. Ovary clavate, green. Fl. B. I. v. 6, p. 511; Engler, in DC. Monog. Phan. v. 2 (1879) p. 616; Trim. Fl. Ceyl. v. 4, p. 354; Prain, Beng. Pl. p. 1107. Arum cuspidatum, Blume, Cat. Hort. Buit. (1823) p. 101. Arum flagelliforme, Roxb. Hort. Beng. (1814) p. 65; Lodd. Bot. Cab. (1819) t. 396; Wight, Icon. t. 791.—Flowers: Aug.—Sept.

Rare. Konkan: Parel near Bombay, Ranade!—Distrib. India (Bengal, Birma, W. Peninsula); Ceylon, Malay Peninsula and Islands.

6. THERIOPHONUM, Blume.

Tuberous monœcious herbs; stem 0. Leaves few, petiolate, always undivided, cordate or sagittate, appearing simultaneously with the flowers. Tube of spathe short, convolute, constricted at the mouth, persistent; limb deciduous. Spadix slender. Male and female inflorescences distant, the male with subulate neuters above and long narrow clavate ones immediately below it, the female of obconic ovaries at the base of the spadix, the interspace between the female inflorescence and lower neuters naked. Anthers sessile, globose. Ovary sessile, 1-celled; stigmas pulvinate; ovules many, some basilar and some pendulous from the apex of the cell, orthotopous. Berries ovoid or oblong.—Distrib. Species 5, all Indian.

1. Theriophonum Dalzellii, Schott, Aroid. (1853) p. 15. Tuber of the size of a walnut; stem 0. Leaves appearing with the flowers, 4-S in. long, of variable breadth, elliptic, oblong, or linear, acute or subobtuse, base rounded or hastate, or sagittate; petiole 4-10 in. long. Peduncle stout, 3-6 in. long, from the sheathing base of the leaves, in fruit twisted and curved to the ground. Spathe 4-7 in. long, oblong-lanceolate; tube green when young, soon fading to white; limb flat, deep purple, rapidly fading. Appendage of spadix terete, elongate, purple at the base, greenish-yellow above. Anthers rosy-purple, opening by pores. Neuter flowers greenish-yellow. Ovary green; ovules 4-6, of which 1-3 are pendulous from the top of the cell of the ovary, the

remaining ones basal, erect. Fruit angular, 4-5-seeded. Fl. B. I. v. 6, p. 513; Engler, in DC. Monog. Phan. v. 2 (1879) p. 608; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428. Tapinocarpus indicus, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 346; Dalz. & Gibs. p. 258. Tapinocarpus Dalzellii, Schott, Gen. Aroid. (1858) t. 15.—Flowers: July-Aug.

Konkan: Stocks!, Dalzell!; Vingorla, Dalzell, moist grassy places in S. Konkan, Dalzell & Gibson, Kalyan, Woodrow! Kanara: Karwar, Talbot, 85!—Distric. India (W. Peninsula).

7. SAUROMATUM, Schott.

Tuberous herbs lensing after flowering. Leaf solitary, pedatipartite with a long petiole. Flowers monœcious. Spathe with a short peduncle; tube cylindric, short, the margins connate below; limb very long, narrow, open, reflexed. Spadix sessile, very long, with a slender barren appendage as long as the spathe. Male and female inflorescences short, widely distant, dense-flowered, with a few large clavate neuters close above the females. Male inflorescence: Anthers large, sessile, subcompressed, 4-lobed; cells contiguous, opposite, obovate-oblong, opening by terminal pores; connective at length prominent. Female inflorescence: Ovary oblong, 1-celled, rounded at the apex; oxules 1-2, erect, basal; style very short or 0. Fruit of obpyramidal 1-seeded substipitate berries. Seeds globose or somewhat convex, with an obconic strophiole; albumen copious; embryo axile.—Distrib. Tropical Asia and Africa; species about 6.

1. Sauromatum guttatum, Schott, in Schott & Endlich. Meletem. (1832) p. 17. Tuber large. Leaf pedatisect, 6-12 in. broad; segments 7-15, variable, 2-15 by 1-3 in., elliptic, acuminate, deep green; midrib and veins impressed above, prominent beneath, the lower part of the midrib often spotted; petiole stout, 12-18 in. long, green or spotted. Peduncle rather short, stout, green or spotted. Spathe 12-28 in. long; tube ovoid or subglobose; limb linear-lanceolate, thick, green or yellowish, usually with dark purple spots or blotches, the margins generally purple and waved. Spadix shorter than the spathe; appendage 2-8 in. long, cylindric and obtuse, or narrowed from the base to a fine point, green or dark purple. MALE INFLORESCENCE ; in. long, about 3 in. above the female. Anthers densely packed. Frmale inflorescence in. long. NEUTERS 1 in. long, spreading, close above the female. Fl. B. I. v. 6, p. 508; Engler, in DC. Monog. Phan. v. 2 (1879) p. 570; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 428; Prain, Beng. Pl. p. 1109. Sauromatum punctatum, C. Koch, in Wochenschr. v. 1 (1858) p. 263; N. E. Brown, in Gard. Chron. (1880) part 2, p. 134. Aruni sessiliflorum, Roxb. Fl. Ind. v. 3 (1832) p. 507; Wight, Icon. t. 800 .-Flowers: April. VERN. Nurki.

KONKAN: Stocks; Thana, Law, Lisboa. Deccan: Mawal (Poona districts), Woodrow, Lanoli, Woodrow!—Distrin. India (Panjab, Upper Gangetic Plain, Himalaya from Nipal to Simla, W. Peninsula).

The leaf figured as the leaf of Pythonium Wallichianum in the 'Journal of the Rombay Natural History Society' [v. 7 (1893) p. 312, plate D] is that of this plant. The inflorescence figured on the same plate is that of Amorphophallus commutatus, Ingler.

8. AMORPHOPHALLUS, Blume.

Tuberous herbs flowering before or together with the leaves. Leaf solitary, 3-partite; segments pinnatisect. Flowers monœcious. Spathe with an open or convolute funnel-shaped or campanulate limb. Spadix exserted or included; appendage large, short or long. Inflorescence cylindric, dense-flowered; males and females contiguous; neuters 0. Mald inflorescence: Stamens 2-4; anthers sessile, the cells oblong, opening by apical pores. Female inflorescence: Ovaries globose, 1-4-celled; ovules in each cell solitary, sub-basal, anatropous; style short or long; stigma entire or 2-4-lobed. Fruit of clustered sub-globose or obovoid berries. Seeds large; albumen 0; embryo macropodous.—Distrib. Tropics of the Old World; species 30-40.

Spathe greenish-pink, 6-10 in. broad; appendage irregularly amorphous, dark-purple

Spathe brownish-purple, 2-5 in. broad; appendage terete, smooth, cream-colored

2. A. campanulatus.

3. A. commutatus.

1. Amorphophallus bulbifer, Blume, Rumphia, v. 1 (1835) p. 148. Tuber globose, 2-4 in. in diam. Leaf 12-18 in. in diam., ultimately bulbilliferous at the base, on the forks and on the nerves above; petiole 3-4 ft. long, spotted; leaflets 3-8 in. long, obovate or lanceolate, with purple edges. Peduncle 8-12 in. long, green and pink, streaked with green or black. Spathe 5-8 in. long, erect, pale-pink or yellowish shaded with pink, rose-pink inside. Spadix sessile; appendage 3-4 in. long, conoid or oblong, rounded at the top, pale flesh-colored or white. Male inflorescence reaching 1½ in. long. Anthers short. Female inflorescence 1 in. long. Stigma 2-lobed. Fl. B. I. v. 6, p. 515; Engler, in DC. Monog. Phan. v. 2 (1879) p. 317; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428; Prain, Beng. Pl. p. 1109; Watt, Dict. Econ. Prod. v. 1, p. 225. Arum bulbiferum, Roxb. Hort. Beng. (1814) p. 65, Bot. Mag. t. 2072 & t. 2508; Grah. Cat. p. 229.—Flowers in April; leaves appear in June and July.

KONKAN: S. Konkan, Graham. S. M. Country: Londa, Woodrow. This is included on the authority of Graham, who gives the S. Konkan as its habitat, and of Woodrow, who reports its occurrence at Londa near Dianwar in the S. M. Country. I have seen no specimens from the Bombay Presidency; there are none in Herb. Kew.—Distrib. India (Bengal, Sikkim, Khasia Hills, Birma, W. Peninsula).

2. Amorphophallus campanulatus, Blume ex Decaisne, in Nouv. Ann. Mus. Par. v. 3 (1834) p. 366. Tuber depressed-globose, 8-10 in. in diam., bulbiferous, dark brown. Leaves appearing long after the flowers, 1-3 ft. broad; segments spreading, simple or forked; petioles 2-3 ft. long, stout, warted, dark green, with paler blotches; lenflets 2-5 in. long, of variable width, obovate or oblong, acute, strongly many-veined, with green edges. Peduncle short, stout, elongating in fruit; sheaths linear-oblong. Spathe campanulate, pointed, 6-10 in. broad, strongly closely veined, with recurved undulate and crisped margins, greenish-pink externally with pale occllated blotches, base within purple. Spadix as long as the spathe; appendage varying in size up to 8 by 5 in., globose, conoid or amorphous, sinuately lobulate,

dark red-purple, spongy within. Male infloresonne subturbinate, about 3 in. long, 1-2 in. in diam. Anthers densely crowded, pale-yellow; pollen golden-yellow. Female inflorescence 3 in. long or more, reaching 2½ in. in diam. Ovaries densely crowded, sessile, depressed-globose; style ½ in. long, stout, ascending, purple; stigma large, 2-3-lobed. Berries red, 2-3-seeded, obovoid. Fl. B. I. v. 6, p. 513; Dalz. & Gibs. p. 259; Engler, in DC. Monog. Phan. v. 2 (1879) p. 309; Trim. Fl. Ceyl. v. 4, p. 355; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428; Prain, Beng. Pl. p. 1109; Watt, Dict. Econ. Prod. v. 1, p. 225. Arum campanulatum, Roxb. Cor. Pl. v. 3 (1819) p. 68, t. 272; Grah. Cat. p. 228; Wight, Icon. t. 785.—Vern. Suran.

Cultivated in Bombay gardens for the large tuberous roots which are eaten; also to a considerable extent in the Decean and Gujarat. Dalzell says that it grows wild on the banks of rivers in the Southern Konkan.—Distrib. Cultivated largely throughout the plains of India and Ceylon.

3. Amorphophallus commutatus, Engler, in DC. Monog. Phan. v. 2 (1879) p. 319. Annual; tuber oblate-spherical, 4 by 2 in... depressed above. Leaf solitary, appearing a month or more after the flowers, about 2 ft. in expansion, 3-sect *, each primary division 2-sect; petiole reaching 2 ft. long by $\frac{n}{4}$ in. in diam., tapering upwards, solid, rough and variously spotted. Leaflets: 1 terminal 4½ by 2 in., 2 decurrent on each side and 2 below the bifurcation, reducing in size downwards. Peduncle 1-3 ft. long by about 3 in. in diam. at the base, tapering upwards, variously spotted with purple and white and rough with minute spinules; cataphylls 2 (sometimes 3), sheathing the base of the peduncle, pale rose-colored, acute, the longest about 4 in. long. Spathe thick, brownish-purple outside, pinkish-purple inside, 6-10 by 2-5 in., ovate-lanceolate, acute or acuminate, broadest at the middle, rough inside at the base, obtuse at the tip. Spadix sessile, columnar; appendage as long' as or longer than the spathe, creamcolored, terefe, smooth, not contracted above the inflorescence, the tip obtuse. Male intlorescence 1-2 in. long. Anthers sessile, at first round, straw-colored, changing to brownish-purple and becoming enlarged and irregularly quadrate in outline. FLMALE INFLORESCENCE: Ovaries numerous, 1-celled; ovule solitary; stigma sessile, disciform, orangered. Fl. B. I. v. 6, p. 515; Lisbon, in Journ. Bomb. Nat. v. 10 (1896) p. 527; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428. Amorphophallus sylvaticus, Dalz. & Gibs. Bo. Fl. (1861) p. 259 (not of Kunth). Dracontium polyphyllum, Grah, Cat. Pl. Bo. (1839) p. 229 (not of Denst.). Pythonium Wallichianum, Kirtikar, in Journ. Bomb. Nat. v. 7 (1893) p. 312 (not of Schott) the flower only.—Flowers: May-June. VERN. Shevla.

Konkan: Stocks, Graham; S. Konkan, Dalcell of Gibson; Western Ghats from Bombay to Kumpta, Lisboa; Marmagão, Woodrow!; Matheran, Cooke!, Lisboa; near Kalyan, Woodrow; Shovdi near Bombay, Woodrow.—Distrib. India (W. Peninsula).

The appearance of the leaves so long after the flowers has rendered it difficult to obtain authentic specimens of the former until the plant was grown by Woodrow in the Botanical Garden of the College of Science at Poona and specimens sent to Kew. The late Dr. Lisboa has described the plant at great length from Woodrow's

^{*} Woodrow has sent to Herb. Kew, an abnormal 5-sect leaf from a tuber planted in the College of Science Bot. Garden at Poona.

specimens in the 'Journal of the Bombay Natural History Society,' v. 10 (1896)

p. 527.

The plant is very common at Matheran, where its flowers appear about the end of May. When the authers are ripe, the odor of the plant is most offensive, resembling carrion, and visitors to the Hill often complain of defective conservancy at this time.

9. ARIOPSIS, Nimmo.

A small tuberous herb. Leaves entire, peltate. Spathe small, cymbiform, open, persistent; tube 0. Spadix shorter than the spathe; appendage 0. Male flowers cylindric; female adnate to the base of the spathe. Male inflorescence: Flowers imbedded in the tissue of the spadix. Anthers counate in groups of 3, each 2-celled, surrounding a pore into which they all open. Female inflorescence: Ovaries few, oblong, 1-celled, secund; ovules many, orthotropous, 2-seriate, on 4-6 parietal placentas; stigma sessile, stellately 4-6-fid. Berries 3-6-angled, many-seeded. Seeds pendulous; albumen copious; embryo axile.—Distrib. Species 1, Indian.

1. Ariopsis peltata, Nimmo, ex Grah. Cat. Pl. Bo. (1839) p. 252. A small plant; tubers small, green, clustered, with many slender root-fibres. Leaf solitary, 1-6 in. in diam., membranous, peltate, orbicular or shallowly cordate, tip rounded or acute, glaucous beneath; petiole 3-8 in. long, slender. Peduncle 1½-4 in. long, very slender; cataphylls 2 or 3, white spotted with purple, ½-¾ in. long. Spathe ½-½ by ¾-½ in., incurved, apiculate, violet with a green dorsal ridge, paler within. Spadix shorter than the spathe, decurved; appendage 0. Male flowers dark purple; female flowers green. Stigma yellow. Fl. B. I. v. 6, p. 519; Dalz. & Gibs. p. 259; Engler, in DC. Monog. Phan. v. 2 (1879) p. 528; Bot. Mag. t. 4222; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428. Ariopsis protanthera, N. E. Brown, in Rep. Roy. Gard. Kew (1877) p. 51. Remusatia vivipara, Wight, Icon. t. 900 (not of Schott).—Flowers: June-Sept.

KONKAN: Stocks!, Dalzell & Gibson; Neral below Matheran, Woodrow.—Distrib. India (W. subtropical Himalaya, Birma, W. Peninsula).

10. REMUSATIA, Schott.

Tuberous herbs, emitting long leasless bulbilliferous shoots from the crown of the tuber. Leaf solitary, entire, peltate, coming up after the flowers. Flowers monocious. Spathe coriaceous, shortly stipitate; tube convolute, constricted at the mouth, accrescent over the fruit; limb broad or narrow, erect, or spreading and reflexed, deciduous. Spadix very short, sessile; appendage 0. Male and female inflorescences distant, with interspersed neuters. Male inflorescence forming a clavate mass of densely packed flat-topped anthers mixed with neuters, the individual stamens with a fleshy connective bearing 2-3 small immersed anther-cells opening by terminal slits. Female inflorences ovules many, on parietal placentas, orthotropous; stigma sessile, discoid. Fruit of small clustered berries. Seeds small; albumen copious; embryo axile,—Distrib. Species 2, Indian.

1. Remusatia vivipara, Schott, in Schott & Endlich. Meletem. Tubers 1-13 in. in diam., clustered, depressed, rooting from the crown; bulbilliferous shoots 6-12 in. long, as thick as a goosequill, simple or shortly branched, ascending, flexuous, bearing at the nodes clusters of oblong, squarrosely scaly bulbils \(\frac{1}{10}\) \(\frac{1}{4}\) in. long. Leaves peltate, 5 by 31 to 18 by 12 in., membranous, orbicular-ovate or -cordate, acute or acuminate, with strong main nerves and fine venation between them; petiole 6-12 in. long, with a short sheath. Spathe 4-5 in long, coriaceous; tube 1-2 in. long, oblong or ovoid, green; limb 2-3 in. long, broadly orbicular-ovate or ovate-cordate, 2-3 in. broad, golden-Spadix $1-1\frac{1}{2}$ in. long; the male inflorescence $\frac{1}{4}$ in. long. The plant rarely flowers, but sends up long bulbilliferous shoots from the crown of the tuber. Fl. B. I. v. 6, p. 521; Dalz. & Gibs. p. 259; Engler, in DC. Monog. Phan. v. 2 (1879) p. 496; Trim. Fl. Ceyl. v. 4, p. 358; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428; Prain, Beng. Pl. p. 1113. Arum viviparum, Roxb. Fl. Ind. v. 3 (1832) p. 496; Grah. Cat. p. 228; Wight, Icon. t. 798.

KONKAN: both Konkans, Numno ex Graham; in the clefts of trees in Ghát jungles, Datzell & Gibson; Neral below Matheran, Bhiva! Duccan: Lanoli, Woodrow; Khandala, Woodrow; Koina Valley below Mahableshwar, Cooke!--Distrib. India (subtropical Humalaya, Khasia Hills, Chota Nagpur, W. Peninsula); Coylon, Java.

11. POTHOS, Linn.

Evergreen branching shrubs, climbing by aerial roots. Leaves distichous, obliquely linear to ovate, the blade sometimes obsolete; petiole winged or leaf-like, sheathing at the base. Flowers hermaphrodite, all fertile. Peduncles axillary or infra-axillary, leafy, or sheathed, or naked. Spathe small, ovate or concave, coriaceous, persistent. Spadix shorter than the spathe, stipitate. Perianth of 6 segments with hooded tips. Stamens 6; filaments short or long, linear or dilated; anthers terminal, dehiscing by extrorse chinks. Ovary ovoid, oblong, or depressed, 3-celled; ovule solitary in each cell, anatropous, adnate to the inner angle; stigma small, sessile, hemispheric. Berries ellipsoid, often compressed; testa thick; albumen 0; embryo macropodal.—Distant. Tropical Asia, Australia and the Pacific Islands, one species in Madagascar; species about 50.

1. Pothos scandens, Linn. Sp. Pl. (1753) p. 968. A climbing plant clothing trees and walls like ivy; stem as thick as the little finger, much branched, tough, terete, smooth, leafy; internodes $\frac{1}{2}-1$ in. long. Leaves very variable, 2-4 by $\frac{1}{3}-2$ in., obovate, elliptic or lanceolate, acute, acuminate or apiculate, coriaceous, bright green, base cuneate or rounded; petiole broadly winged, 1-3 by $\frac{1}{4}-\frac{7}{2}$ in., the base $\frac{1}{2}$ -amplexicanl. Peduncles $\frac{1}{6}-\frac{3}{6}$ in. long, the base clothed with ovate acute imbricating cataphylls about $\frac{1}{6}$ in. long. Spathe $\frac{1}{6}-\frac{1}{4}$ in long, cymbiform, cuspidate, green. Spadix yellow, as long as the spathe, stipitate, globose, ovoid, or shortly oblong, the stipes as long as the inflorescence. Authers terminal, minute, the cells divaricate. Ovary 3-celled, truncate; stigma minute, lobulate. Berries $\frac{1}{2}-\frac{2}{6}$ in. long, oblong, scarlet, few ripening. Fl. B. I. v. 6, p. 551; Grah. Cat. p. 229; Dalz. & Gibs. p. 257; Engler, in DC. Monog. Phan. v. 2 (1879) p. 84; Trim. Fl. Ceyl. v. 4, p. 364; Woodr.

in Journ. Bomb. Nat. v. 13 (1901) p. 428; Prain, Beng. Pl. p. 1115 .-Flowers: May-July.

Konkan: Stocks!; in dense jungles, Graham; Goa jungles, Dr. Lush ex Graham; Ghát jungles, pretty common, Dalzell & Gibson; ravines about Pár (below Mahableshwar), Graham; Marmagão, Bhua! Kanana: Kadgal (N. Kanara), Woodrow.—Distaib. Throughout India; Ceylon, Malay Islands, China.

Pothos aurea, Linden ex André, in Illustr. Hortic. v. 27 (1880) p. 69, t. 381. A showy plant. Leaves 15 by 10 in., ovate, cordate, acute, thick, fleshy, strikingly variegated, of a dark green, boldly and irregularly marked by bands or fantastic-shaped blotches of yellow varying in intensity from cream to orange. Introduced into England from the Salomon Isles in 1880. In the cemetery in Sewree, Bombay, which is close to the sen, very fine specimens may be seen (Woodrow). Woodr. Gard. in Ind. ed. 5, p. 545.

Pothos nitens, Bull, Cat. (1887) p. 11. A native of the Eastern Archipelago, grown in conservatories and gardens. Leaves ovate, acute, slightly and unequally cordate at the base, of a dark shining bronzypurplish green. Woodr. Gard. in Ind. ed. 5, p. 545.

Excluded Species.

SYNANTHERIAS SYLVATIOA, Schott, Gen. Aroid. (1858) t. 28. Tuber 1-2; in. in diam., bulbilliferous. Leaves 13-23 ft. in diam., petiole 1-2 ft. long, pale green with darker streaks. Leastets few, orate-lanceolate or oblanceolate Spathe 1-4 in. long, pale pink spotted with green, purple within towards the base. Appendage of spadix

reaching 7 in. long, purple, smooth. Malo and female inflorescences distant, with interposed neuters. Fl. B. I. v. 6, p 518, Trim. Fl. Coyl. v. 4, p. 357.

I cannot find any satisfactory evidence of the occurrence of this as a Bombay plant. Engler [DC. Monog Phan. v. 2 (1879) p 320] gives Bombay as its habitat from the specimens in the Herbarium of Hooker and Thomson, which were however obtained from the Nilghiri Hills and Kurg, localities quite outside the Bombay Presidency. There is in Herb. Kew. a solitary specimen which was presented to the Glasgow Butanic Garden by Mrs. Nimmo, but this is accompanied by no authentic note of locality and may have been collected anywhere. Woodrow gives Marmagao in his list, but the Marmagão plant is Amorphophallus commutatus, Engl., which, though quite distinct, has often been mistaken for this.

The plant occurs in S. India and is common in the drier parts of Oeylon.

The following non-indigenous plants not belonging to any of the foregoing genera are more or less cultivated :-

Colocasia Antiquorum, Schott, in Schott & Endlich. Meletem. (1832) p. 18. Rootstock tuberous. Leaves large, ovate, with a broad triangular basal sinus. Spathe 8-18 in. long, caudate-acuminate, erect, pale yellow. Cultivated throughout the hotter parts of India and in all warm regions. All parts of the cultivated plants are eaten, but especially the starch from the tubers which attain 6 in. in diam. Fl. B. I. v. 6, p. 523; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428; Prain, Beng. Pl. p. 1112; Watt, Dict. Econ. Prod. v. 2, p. 509. Arum Colocasia, Linn.

Sp. Pl. (1753) p. 965; Roxb. Fl. Ind. v. 3 (1832) p. 494; Grah. Cat. p. 228. Caladium ovatum, Grah. Cat. p. 229 (not of Vent.).
—Venn. Alu.

Alocasia indica, Schott, in Oestr. Bot. Wochenbl. (1854) p. 410. A stout herb; rootstock suberect, large, 3-8 ft. long, 3-8 in. thick with few soboli. Leaves large, ovate, deeply sagittately cordate; lobes rounded, the sinus narrow. Spathe 8-12 in. long, pale yellowish-green. Fl. B. I. v. 6, p. 525; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428; Prain, Beng. Pl. p. 1111; Watt, Dict. Econ. Prod. v. 1, p. 178. Arum indicum, Roxb. Fl. Ind. v. 3 (1832) p. 498; Wight, Icon. t. 794.

Cultivated in native gardens. The stems and rootstocks are eaten. In Bengal they form an important article of food.

Alocasia macrorhiza, Schott, in Schott & Endlich. Meletem. (1832) p. 18. A very stout herb; rootstock suberect, very large, 6-16 ft. long and as thick as a man's arm. Spathe 6-10 in. long, fragrant. A native of Tropical Asia, Australia, and the Pacific Islands. Occasionally grown in native gardens. Fl. B. I. v. 6, p. 526; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428; Prain, Beng. Pl. p. 1111. Alocasia odora, Watt, Dict. Econ. Prod. v. 1, p. 178.

Alocasia metallica, Hook. in Bot. Mag. (1860) t. 5190 (not of Schott). A slow-growing plant with leaves 12-18 in. long of a rich bronze color on the upper, purple on the lower side, a native of Borneo, often grown in conservatories; a very ornamental plant.

Alocasia Lowii, Hook. in Bot. Mag. (1863) t. 5376. A very ornamental plant when well grown, a native of Borneo. Leaves 14-16 in. long, cordate-sagittate, olive-green, with thick white ribs, deep purple beneath. Woodr. Gard. in Ind. ed. 5, p. 532.

Caladium. The plants of this genus, which contains perhaps 10 true species all natives of South America, have been so hybridized chiefly from Caladium bicolor, Vent., that the florists' varieties have become very numerous. Bull of Chelsea in a list of Caladiums quoted by Woodrow (Gard. in Ind. ed. 5, p. 535) gives about 90 varieties of Caladium, several of which have been introduced into Indian gardens, where their ornamental leaves are striking objects between May and October.

Anthurium. Several varieties of this genus have been recently introduced into gardens and conservatories. Some of the hybrids are extremely handsome.

Acorus Calamus, Linn. Sp. Pl. (1753) p. 324. Rootstock as thick as the middle finger, creeping and branching, very aromatic. Leaves 3-6 ft. by $\frac{3}{4}-1\frac{1}{4}$ in. Cultivated in native gardens and casily established, though not indigenous. Throughout Asia, Europe, and N. America: known as the Sweet Flay in England; formerly used to strew the floors of apartments. Fl. B. I. v. 6, p. 555; Grah. Cat. p. 230; Dalz. & Gibs. Suppl. p. 96; Trim. Fl. Ceyl. v. 4, p. 365; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428; Watt, Dict. Econ. Prod. v. 1, p. 99.—Vern. Yekand.

The root is used medicinally and to keep insects from clothes.

Rhaphidophora pertusa, Schott, in Bonplandia, Jahrg. 5 (1857) p. 45. A lofty epiphytic climber; stem cylindric, reaching 1½ in. in diam., green, smooth, leafy. Leaves 8-18 by 6-10 in., broadly ovate, cuspidate, dark green, often with oblong holes at one side. Spathe shortly pedunculate, yellow. A native of S. India, Ceylon (rare), and the Malay Islands, grown in gardens. Fl. B. I. v. 6, p. 546; Trim. Fl. Ceyl. v. 4, p. 361; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428. Scindapsus pertusus, Schott, in Schott & Endlich. Meletem. (1832) p. 21; Wight, Icon. t. 781. Pothos pertusa, Roxb. Hort. Beng. (1814) p. 83; Grah. Cat. p. 230.

ORDER CXLIL LEMNACEÆ.

Small or minute gregarious aquatic herbs, scale-like or globular, without roots or with capillary ones, propagated by buds or bulbils, rarely by seed. Fronds smooth above, spongy below. Flowers monœcious, 1-3, naked or enclosed in a membranous spathe. Perianth 0. Male thowers: Stamens 1 or 2; anthers 1- or 2-celled, the cells superposed, dehiscing by transverse slits. Female flowers: Ovary sessile, 1-celled, narrowed into a funnel-shaped style; ovules 1-7, basal, erect or horizontal; stigma simple. Fruit a minute flask-shaped utricle indehiscent or opening circumscissilely. Seeds erect or horizontal, 1-7; testa coriaceous; albumen fleshy or 0; embryo cylindric, axile.—Distrib. Species about 20, cosmopolitan.

1. LEMNA, Linn.

Small herbs; fronds with one or more capillary roots rising from the side or the base. Flowers in marginal clefts of the frond, at first enclosed in a small spathe. Male flowers in pairs, one of each pair opening before the other. Stamen solitary; filaments filiform or enlarged in the middle, recurved; anthers 2-celled, globose, the cells dehiscing by transverse slits; pollen muricate. Flimale flower: a solitary ovary close to the male; ovules 1-7, anatropous, semianatropous, or orthotropous. Fruit a utricle, 1-7-seeded. Seeds erect or horizontal; embryo conic or ovoid.—Distrib. Species 17, cosmopolitan.

1. Lemna trisulca, Linn. Sp. Pl. (1753) p. 970. Fronds submerged, $\frac{1}{4}$ — $\frac{3}{4}$ in. long (not including the tail, which often attains $\frac{1}{2}$ in. long), translucent, thin, flat, elliptic-lanceolate or oblanceolate, crenate-serrate near the apex, the joung fronds hastate, at length tailed and attenuated into a stalk by which they remain attached to the parent frond, each frond giving rise to a single root-fibre; root-cap acute. Ovule solitary. Seed semianatropous, horizontal; testa rough, grooved.

The young fronds rise at right angles from one or both sides of the parent frond and remain connected with it crosswise. Fl. B. I. v. 6, p. 557; Dalz. & Gibs. p. 281; Engler, in Engl. & Prantl, Pflanzenf. v. 2, part 3, p. 160, fig. 104; Syme, Eng. Bot. ed. 3, v. 9 (1869) p. 17, t. 1394; Boiss. Fl. Orient. v. 5, p. 29; Prain, Beng. Pl. p. 1116; Watt, Dict. Econ. Prod. v. 4, p. 620.

In ponds and tanks in the Konkan, not common.—Distairs. Temperate and tropical regions.

2. Lemna gibba, Linn. Sp. Pl. (1753) p. 970. Fronds floating, suborbicular or obovate, entire, not tailed, $\frac{1}{3}-\frac{1}{2}$ in. in diam., opaque, thick, flat above, at length very convex beneath, the young fronds sessile, each giving rise to a single root-fibre, the under surface at length spongy and greatly swollen; root-sheath elongate, cylindric; root-cap acute. Stamens 2. Utricle opening circumscissilely. Seeds erect, anatropous; albumen scanty or 0. Fl. B. I. v. 6, p. 556; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428; Boiss. Fl. Orient. v. 5, p. 30; Watt, Dict. Econ. Prod. v. 4, p. 620; Syme, Eng. Bot. ed. 3, v. 9 (1869) p. 22, t. 1396.—Flowers: Sept.

DECCAN: Boshri near Poona, Woodrow .- DISTRIB. Cosmopolitan.

3. Lemna polyrhiza, Linn. Sp. Pl. (1753) p. 970. Fronds herbaceous, not tailed, floating, opaque, thick, flat above, slightly convex below, \(\frac{1}{4-\frac{1}{3}}\) in. in diam., dark green above, usually purplish beneath, 7-veined; epidermal cells with sinuous walls; young fronds sessile, each frond giving rise to a tuft of root-fibres. Spathe 2-lipped. Stamens 2. Ovules 1-2, semianatropous. Fl. B. I. v. 6, p. 557; Trim. Fl. Ceyl. v. 4, p. 367; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 428; Prain, Beng. Pl. p. 1117; Watt, Dict. Econ. Prod. v. 4, p. 620; Syme, Eng. Bot. ed. 3, v. 9 (1869) p. 23, t. 1397. Spirodela polyrhiza, Schleid. in Linnæa, v. 13 (1839) p. 392; Engler, in Engl. & Prantl, Pflanzenf. v. 2, part 3, p. 154, fig. 101 A.—Flowers: Sept.

Decean: Poona, Woodrow .- Distrib. Cosmopolitan.

2. WOLFFIA, Horkel.

Very minute herbs, flattish, globose or conically produced below, rootless. Flowers inserted in a groove on the upper surface of the plant. Spathe 0. Male flower solitary. Stamen solitary; filament short or long; anther globose, 1-celled; pollen smooth. Female flower solitary, close to the male. Ovary globose or ovoid; ovule solitary, orthotropous. Fruit a spherical utricle. Seed globose, erect; testa thick; albumen scanty.—Distrib. Europe, East Indies, Tropical Africa, Tropical and Temperate America; species 12.

1. Wolffia Michelii, Schleid. Beitr. Bot. (1844) p. 233. A minute floating annual herb. Fronds opaque, ovate-oblong or subglobose, $\frac{1}{20}$ in. long or less, convex on both surfaces, not tailed, rootless; young fronds solitary and sessile from the very base of the parent frond. Jackson, Index Kewen. v. 4 (1895) p. 1233. Wolffia arrhiza, Hork. ex Wim. Fl. Schles. ed. 3 (1857) p. 140; Hook. f. Fl. B. I. v. 6, p. 557; Woodr.

in Journ. Bomb. Nat. v. 13 (1901) p. 428; Prain, Beng. Pl. p. 1117. Lemna globosa, Roxb. Hort. Beng. (1814) p. 66; Grah. Cat. p. 252; Dalz. & Gibs. p. 281. Lemna arrhiza, Linn. Mantiss. 2 (1771) p. 294; Syme, Eng. Bot. ed. 3, v. 9 (1869) p. 24, t. 1398.

Tanks throughout the Presidency common, covering the water like a green scum.

ORDER CXLIII. ALISMACEÆ.

Aquatic or marsh herbs, usually erect, sometimes floating. Leaves radical or clustered at the nodes of floating stems, entire, petiolate, often pellucid-dotted or lineolate. Flowers pedicellate, regular, 1-sexual or hermaphrodite, in umbellate or paniculate whorls, usually white or pink; bracts 3 or more, membranous; bracteoles small. Perianth-segments 6 in 2 series, the 3 outer (sepals) herbaceous, the inner whorl petaloid, rarely obsolete. Stamens 6 or more (rarely 3), hypogynous or perigynous; anthers erect, basifixed, 2-celled, dehiscing by lateral or dorsal longitudinal slits. Carpels 3-6 or more, 1-celled, sessile or stipitate on a flat or raised receptacle; ovules 1 or more in each carpel; placentas on the inner angle (rarely ovule solitary and basal); style long or short (rarely 0) subterminal or ventral; stigma simple. Fruit of small achenes or follicles. Seeds small or minute; albumen 0; embryo straight or conduplicate.—Distrib. Genera 12; species about 60, cosmopolitan.

Fruit indehiscent of 3 or more achenes.

Fruit dehiscent of 6-7 follieles; staniens 8-12; flowers hermaphrodite

. 1. LIMNOPHYTON.

2. SAGITTARIA. 3. WISNERIA.

4. Butomorsis.

1. LIMNOPHYTON, Miquel.

A scapigerous stemless palustrine perennial herb with milky juice. Leaves sagittate, erect. Flowers polygamous (male and hermaphrodite), white, in paniculate whorls. Scapes stout. Receptacle flat. Scals 3, herbaceous, persistent. Petals 3, membranous, deciduous. Stamens 6 in 2 series, largest in the male flowers; filaments compressed. Carpels 15-20, obsolete in the male flowers; ovule solitary, anatropous, basal; stigma small on a ventral style. Fruit of several compressed or turgid hard achenes. Seeds erect, basal; testa membranous; embryo horseshoe-shaped.—Distrib. Asia and Tropical Africa; species 1.

1. Limnophyton obtusifolium, Miq. Fl. Ind. Bat. v. 3 (1855) p. 243. Rootstock short, stout, with numerous long root-fibres. Leaves all radical, 6-12 by 4-8 in. (sometimes as broad as long), reniformly or deltoidly sagittate or triangular, acute or subobtuse, or with rounded tip; basal lobes long, tapering to a fine point, spreading, as long as the rest of the blade, the sinus very broad, open; primary nerves 6-8 pairs, radiating from the top of the petiole, with irregular reticulate venation between them; petiole 1-3 ft. long, stout, strate, channelled above. Panicle with a stout angular scape 2-4 ft. long; branches long, erecto-patent, the lower branches usually in 4 whorls; bracts whorled, broadly ovate-lanceolate, acuminate, with many parallel

nerves, the lower reaching 1 in. long. Flowers many, $\frac{1}{6}-\frac{1}{2}$ in. in diam., white, in whorls at the nodes of the branches of the panicle 4-15 in a whorl, the upper whorls mostly male, the lower hermaphrodite; pedicels 1-3 in. long, those of the male flowers more slender than the female. Sepals 3, orbicular-ovate, concave, ribbed, green. Petals 3, broadly obovate, $\frac{1}{6}$ in. long and broad. Filaments 6, flattened, with dilated bases. Achenes in a globose head $\frac{1}{2}-\frac{3}{4}$ in. in diam., obovoid, turgid, wrinkled. Fl. B. I. v. 6, p. 560; Micheli, in DC. Monog. Phan. v. 3.(1881) p. 39; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Prain, Beng. Pl. p. 1119. Sagittaria obtusifolia, Linu. Sp. Pl. (1753) p. 993; Grah. Cat. p. 199; Dalz. & Gibs. p. 249.—Flowers: Feb. Vern. Nalkut.

Konkan: Stocks!; tanks throughout the Konkans, Graham. Kanana: Halyal tauk, Ritchie, 1390! Gujarat: Dalzell & Gibson: Ankleshwar near Bronch, Woodrow.—Distrib. India (W. Peninsula); Ceylon, Tropical Africa, Madagascar.

2. SAGITTARIA, Linn.

Erect, stemless, usually perennial aquatic herbs. Leaves with long petioles, elliptic, cordate or sagittate. Flowers 1-sexual or polygamous, in paniculate or spicate whorls. Sepals 3, herbaccous, persistent. Petals 3, membranous, deciduous. Stamens in male flowers about 24 with only staminodes in the female flowers, or 6-10 in the male flowers with 9-12 in the hermaphrodite; filaments filiform, compressed. Carpels very many, crowded on a large globose or oblong receptacle, flattened Interally. Ovary solitary, basal; style ventral or apical; stigma papillose. Fruit a globose or oblong head of flattened crested or winged achenes. Seed erect, basal; testa thin; embryo horseshoeshaped.—Distrib. Species about 15, temperate and tropical.

1. Sagittaria sagittifolia, Linn. Sp. Pl. (1753) p. 993. Rhizome thick, tuberous, stoloniferous. Leaves radical, 2-8 in. long, very variable, the first leaves of the young plants very slender and very acute, the next one or two simply cordate-oblong, the rest sagittate, acute, smooth, with more or less divergent basal lobes which are 2-3nerved and narrower than the upper part of the blade, which latter is oblong or lanceolate, acute, 5-nerved, the nerves extending from the top of the petiole to the apex of the leaf; petioles sometimes reaching nearly 2 ft. long, 3-gonous. Scape 6-18 in. long. Flowers 3-3 in. in diam., white, often with a purple claw, in 3-5 whorls along the scape with 3-5 (usually 3) flowers in each whorl, the lower whorls female, the upper male, with longer pedicels (hermaphrodite flowers occur sometimes, but rarely); bracts narrowly ovate, membranous. Sepals ovate, acute, much smaller than the petals. Petals large, broadly Filaments in the male flowers very many, absent in the female flowers; anthers sagittate. Achenes obliquely obovate, flattened, apiculate, winged, the wings broad, entire or subcrenate. Fl. B. I. v. 6, p. 561; Grah. Cat. p. 199; Buchenau, in Engl. & Prantl, Pflanzenf. v. 2, part 1, p. 231, fig. 176; Micheli, in DC. Monog. Phan. v. 3 (1881) p. 66; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Prain, Beng. Pl. p. 1120; Syme, Eng. Bot. ed. 3, v. 9 (1869) p. 68, t. 1436; Watt, Dict. Econ. Prod. v. 6, part 2, p. 383.—Flowers: Sept.

Rure in the Bombay Presidency. Konnan: Stocks!; Molwin, Woodrow.—Distrib. Europe, Asia, N. America.

3. WISNERIA, Micheli.

Scapigerous marsh herbs. Leaves radical, long-petiolate, narrowly lanceolate. Flowers monœcious, in remote involucrate whorls on a slender rhachis; involucre campanulate, truncate, membranous. Sepals 3, equal or one longer, persistent. Petals 2-4, equalling or smaller than the sepals. Male flowers: Stamens 3. Pistillodes subulate. Flimale flowers: Staminodes 3, setaceous. Carpels 3-6, erect, ovoid; receptacle small, tumid; ovule solitary, basal; style 0 or terminal; stigma minute. Achenes and seed subglobose or compressed; testa thin; embryo horseshoe-shaped.—Distrib. Asia, Africa, and Madagascar; species 3.

1. Wisneria triandra, Micheli, in DC. Monog. Phan. v. 3 (1881) p. 82. A herb about 1 ft. high; root fibrous. Leaves glabrous, longpetiolate, longer than the scape, reaching with the petiole 9-15 in. long, the blade less than & in. broad, narrowly linear-spathulate, obtusely keeled on the back; midrib stout, penninervuled, the lateral nerves slender, submarginal; petioles terete, sheathing at the base, twice as long as the leaf-blade. Scape erect, simple, terete, 5-6 in. high, floriferous at the apex, obtusely 3-gonous. Whorls of flowers 6-8, of which the 1-2 lower consist of females, the upper of males. white, usually 3 in a whorl; pedicels short, longer than the bracts; bracts connate, sheathing, obtuse. Sepals 3, linear-oblong. Petals 3, shorter than the sepals. Male flowers: Stamens 3, opposite the sepals; anthers didymous; filaments short. Fixale Flowers: Achenes few, subglobose or obovoid, smooth. Fl. B. I. v. 6, p. 562; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 429. Sagittaria triandra, Dalz. in Kew Journ. Bot. v. 2 (1850) p. 144; Dalz. & Gibs. p. 249,— Flowers: Aug.

Konkan: Malwan, Dalzell!, Woodrow,-Distrib. India (W. Peninsula). .

4. BUTOMOPSIS, Kunth.

An annual scapigerous marsh herb with milky juice. Leaves radical, elliptic, acute. Flowers hermaphrodite, umbellate on a scape; whorls sometimes superposed, bracteate. Sepals 3, herbaceous, persistent. Petals 3, membranous, deciduous, white, larger than the sepals. Stamens 8-12 (usually 9), hypogynous; 6 outer in pairs opposite the sepals, sometimes one of a pair obsolete; 3 inner single, opposite the petals, sometimes one or more replaced by a pair; filaments filiform; anthers oblong. Carpels 6-9, whorled, on a flat receptacle, sessile, shortly connate below, 1-celled; ovules many, small, on reticulate parietal placentas, ascending, anatropous; style short. Fruit of 6-7 erect membranous follicles. Seeds numerous, minute, parietal, smooth; embryo conduplicate, horseshoe-shaped.—Distrib. Asia, Africa, Tropical Australia; species 2.

1. Butomopsis lanceolata, Kunth, Enum. v. 3 (1841) p. 165. Rhizome small, sending out leaves above, fibrous roots below. Leaves 2-6 by $\frac{5}{6}$ -2 $\frac{1}{4}$ in., elliptic-lanceolate, acute, membranous, quite entire, attenuated into the petiole; main nerves 5-7; petioles dilated at the base, reaching 8 in. long. Scape usually longer than the leaves, stout,

bearing an umbel of 3-20 flowers at its apex; bracts below the umbel scarious, 1-5 in. long, ovate, acute; pedicels very variable in length, 1-6 in long in the same umbel. Sepals 3, herbaceous, $\frac{1}{3}$ by $\frac{1}{4}$ in., elliptic, obtuse, reticulately veined, persistent. Petals white, fugacious. Follicles 6-7, reticulately veined, tapering into short beaks. Seeds very numerous, oblong, with rounded ends, about 10 in. long, dark brown, shining. Fl. B. 1. v. 6, p. 562; Dalz. & Gibs. p. 249; Micheli, in DC. Monog. v. 3 (1881) p. 87; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Prain, Beng. Pl. p. 1120. Butomus lanceolatus, Roxb. Hort. Beng. (1814) p. 89; Grah. Cat. p. 251.—Flowers: Nov.

Rare in the Bombay Presidency Gujanat: tank at Chikli near Surat, Law ex Graham; Godra, Woodrow. - Distrib. Plants of India; Tropics of the Old World, Australia.

ORDER CXLIV. NATADACEÆ.

Aquatic or marsh herbs of various habit; rootstock stout or slender, sometimes tuberous, often creeping or 0; stem floating or rooted in the ground. Leaves entire or serrate, submerged or floating, sheathing at the base, sometimes stipulate. Flowers 1- or 2-sexual, green, usually inconspicuous, in spikes, racemes, or terminal or axillary pedunculate spadices; bracts small or 0. Perianth 0, or of 3-4 inferior valuate segments, or tubular and very delicate. Stamens 1-6, hypogynous, free in 2-sexual flowers, solitary or connate in male flowers; anthers 1-2-celled. Carpels 1-6; ovules 1 or more in each carpel, erect or pendulous; style long or short; stigma usually simple, sometimes stigmas 2-3 capillary. Fruit various. Seeds erect, pendulous, or laterally peltate; testa coriaceous or somewhat fleshy; albumen 0; embryo fleshy, straight.—DISTRIB. Genera 16; species about 150, temperate and tropical.

Flowers 2-sexual.

Perianth of sepals present; carpels sessile.

Sepals 1-3, white, pink or pale blue, membranous; stamens 6 or more

1. Ароноситоч. 2. Ротамоситом. Sepals 4, green, herbaceous; anthers 4, sessile...... Persanth wanting; carpels stipitate, anthers 2, sessile ... 3. Ruppia.

Flowers 1-sexual Style long, slonder; stigma oblique, poltate; achones 2-9;

male perianth double 5. NAIAS.

4. Zannichellia.

APONOGETON, Linn. f.

Scapigerous fresh water herbs; rootstock tuberous, crowned by numerous root-fibres. Leaves oblong, floating or submerged, mem-Flowers 2-sexual, on long scapes bearing solitary or geminate, often unilateral spikes, which when young are enclosed in a conical quickly deciduous sheath. Perianth of 1-3 equal or unequal pink, white, or pale blue segments or obsolete. Stamens 6 or more; filaments subulate, unequal, persistent; anthers didymous. Carpels 3-6; ovules 2 or more in each carpel, basal, anatropous; style short or 0; stigma discoid or decurrent, persistent. Seeds erect; testa thick or thin; albumen 0; embryo straight .- DISTRIB. Species 22, Asiatic, African, and Australian.

1. Aponogeton monostachyon, Linn. f. Suppl. (1781) p. 214. An aquatic herb; rootstock \(\frac{1}{3}-\frac{1}{2}\) in. in diam., stoloniferous, edible. Leaves floating, 2\(\frac{1}{2}-\text{S}\) by \(\frac{3}{4}-\frac{1}{2}\) in., oblong or linear-oblong, acute or obtuse, base cuneate, rounded, or cordate, 3-5-nerved and with numerous distinct cross nervules between them; petioles varying with the depth of the water, often very long, subtrigonous. Scape varying with the depth of the water; spike solitary, 1-6 in. long, dense- or lax-flowered; flowers white, pink or pale blue. Sepals 2, obovate or suborbicular, \(\frac{1}{10}\) in. long and broad. Stamens 6, as long as or longer than the perianth-segments; anthers bluish-purple. Carpels 3. Follicles subglobose; style subulate. Seeds 4-8, oblong; testa lax, 6-8-ribbed, striate. Fl. B. I. v. 6, p. 564; Grah. Cat. p. 200; Dalz. & Gibs. p. 248; Trim. Fl. Ceyl. v. 4, p. 372; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Prain, Beng. Pl. p. 1122; Watt, Dict. Econ. Prod. v. 1, p. 277.—Flowers: July-Dec.

KONHAN: Stocks!, Graham; Salsette, Graham. S. M. Country: tanks in the Dharwar and Belgaum Collectorates, Datell & Gibson; Sanasji (Dharwar districts), Woodrow! Gujarat: Godra, Woodrow.—Distrib. Throughout India; Ceylon, Tropical Asia, and Australia.

2. POTAMOGETON, Linn.

Aquatic submerged herbs with creeping rootstock. Leaves submerged or floating, opposite or alternate, entire or toothed; stipules interfoliaceous. Flowers minute, hermaphrodite, spicate on a short or long axillary or leaf-opposed peduncle arising from a sheath; bracts 0. Perianth of 4 concave green valvate segments. Stamens 4; anthers sessile at the base of the segments of the perianth, didymous. Carpels 4, free, sessile, 1-celled and 1-ovulate; ovule campylotropous, adnate to the inner angle of the carpel; stigma subsessile or decurrent, persistent. Fruit of small coriaceous or spongy drupelets. Seed subreniform; embryo macropodal.—Distrib. Species about 80, cosmopolitan.

1. Potamogeton indicus, Roxb. Fl. Ind. v. 1 (1832) p. 452. Stem terete, branched, smooth, its length depending on the depth of the water. Leaves petiolate; the upper floating, $2\frac{1}{2}-4$ by $1-1\frac{1}{2}$ in., alternate or uppermost opposite, oblong or elliptic-lanceolate, acute, obtuse or acuminate, thinly coriaceous, opaque, glossy, many-nerved, base acute or rounded, the petioles variable in length with stipules $1-1\frac{1}{2}$ in. long, free; the lower submerged leaves reaching 8 in. long, membranous, undulate, with petioles shorter than the blade. Peduncles axillary or leaf-opposed, 1-2 in. long, stout or slender, not thickened upwards. Spike $1\frac{1}{2}$ in. long, dense-flowered, green. Sepals 4, clawed, $\frac{1}{\sqrt{6}}$ in. long,

including the claw which is nearly as long as the limb; limb suborbicular, $\frac{1}{10}$, $\frac{1}{12}$ in. broad, concave. Drupelets $\frac{1}{10}$ in. long, obliquely trancate, shortly beaked. Fl. B. I. v. 6, p. 565; Grah. Cat. p. 200; Dalz. & Gibs. p. 248; Trim. Fl. Ceyl. v. 4, p. 373; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Prain, Beng. Pl. p. 1122.—Flowers: Dec.

Pretty common in tanks and ponds. Deccan: water-holes of the high hill forts of the Western Deccan, Dutzell of Gibson; Poona, Woodrow!, Cooke!—Distrib. Throughout the plains of India; Ceylon, Malay and Sandwich Islands.

2. Potamogeton perfoliatus, Linn. Sp. Pl. (1753) p. 126. Stem stout, terete, slightly branched. Leaves 1-2½ by £-1 in., sessile, ovate-lanceolate, obtuse, membranous, translucent, amplexicaul, base cordate, 5-9-nerved; stipules small, caducous. Peduncle stout, short, not thickened upwards. Spikes dense-flowered, ½-7 in. long. Sepals with long claws, elliptic-obovate. Drupelets ½ in. long, obliquely ovoid, hardly keeled, slightly compressed, with a short usually curved beak. Fl. B. I. v. 6, p. 566; Dalz. & Gibs. p. 248; Reichb. Icon. Fl. Germ. v. 7 (1845) p. 19, t. 29; Syme, Eug. Bot. ed. 3, v. 9 (1869) p. 42, t. 1412; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 429.—Flowers: Dec.—Feb.

Deccan; in the stream round Dapuri garden near Poona, Dalzell & Gibson; Poona, Cooke!, Woodrow! Sind: Jemadar ka Landa near Karachi, Stocks, 380!—Distrib. India (W. Himalaya, W. Tibet, W. Poninsu!a); N. temperate regions, Australia.

3. Potamogeton crispus, Linn. Sp. Pl. (1753) p. 126. Stem branched, compressed. Leaves 1-3 by \$\frac{1}{6}-\frac{3}{6}\$ in., all submerged, semi-amplexicaul, linear or linear-oblong, obtuse, with crisped and finely serrulate margins, 3-nerved, translucent; stipules small, caducous. Peduncle long, often curved, taperiug upwards. Spike \$\frac{1}{2}-\frac{1}{3}\$ in. long, few-flowered; flowers small. Sepals clawed, \$\frac{1}{10}\$ in. long including the claw; limb suborbicular. Drupelets obliquely ovoid, \$\frac{1}{6}\$ in. long, terminated by a slightly recurved compressed beak. Fl. B. I. v. 6, p. 566; Dalz. & Gibs. p. 248; Reichb. Ieon. Fl. Germ. v. 7 (1845) p. 18, tt. 29, 30; Syme, Eng. Bot. ed. 3, v. 9 (1869) p. 43, t. 1413; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Prain, Beng. Pl. p. 1123; Watt, Dict. Econ. Prod. v. 6, part 1, p. 331. Potamogeton tuberosus, Roxb. Hort. Beng. (1814) p. 12; Grah. Cat. p. 200.

KONRAN: tanks in the Konkans, Dalzell & Gibson: Decean: Poona, Woodrow.—Distrib. Plains of India and temperate Himalaya; North and South temperate and subtropical regions.

4. Potamogeton pectinatus, Linn. Sp. Pl. (1753) p. 127. Stem filiform, copiously distinhously branched, forming with the leaves tassellike masses when taken out of the water. Leaves all submerged, alternate, 1-6 by $\frac{1}{25} - \frac{1}{10}$ in., narrowly linear or filiform, acute, opaque, 1-3-nerved or the lower sometimes 5-nerved; stipules adnate to the leaf-sheaths, the tips free. Pedancle with the spike 2-3 in. long, filiform, usually longer than the leaves, not thickened upwards; flowers few in few distant whorls, minute, green. Sepals suborbicular. Drupelets $\frac{1}{16} - \frac{1}{16}$ in. long, turgid, dimidiate-obovoid, slightly compressed, shortly beaked, rounded and obscurely 3-keeled on the back, with a very

short straight beak. Fl. B. I. v. 6, p. 567; Dalz. & Gibs. p. 248; Trim. Fl. Ceyl. v. 4, p. 374; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Prain, Beng. Pl. p. 1123.—Flowers: Aug.

Dalzell without locality in Herb. Kew.! Deccan; Poona, Woodrow. Gujarat: tank at Gogo (Kathiawad) plentiful, Dalzell & Gibson. Sind: Jemadar ka Landa, near Karachi, Stocks, 875!; Manchar Lake, Stocks!—Distaid. Plains of India, the Himalayas, and Western and Eastern Tibet; Coylon, most regions.

3. RUPPIA, Linn.

Submerged plants growing in brackish water; rootstock creeping, much-branched; stems slender, dichotomously branched. Leaves alternate or subopposite, filiform, formed of two parallel tubes; sheath clongate, narrow. Flowers minute, hermaphrodite, 2-6 together within a leaf-sheath on an ultimately elongating straight or spirally coiled peduncle. Perianth 0. Stamens 2; anthers sessile, 2-celled. Carpels 4; ovule solitary in each carpel, pendulous; stigma peltate. Fruit of 4 stipitate ovoid obtuse or beaked achenes. Seed pendulous, uncinate; embryo macropodal.—Distrib. Species 2 or 3, temperate and subtropical.

1. Ruppia rostellata, Koch, ex Reichb. Icon. Pl. Crit. v. 2 (1824) p. 66, t. 174, fig. 306. A submerged aquatic herb growing in brackish water, forming tangled masses of filiform leafy flaccid stems and branches; stems 2 ft. long or more. Leaves filiform, 2-4 in. long, dull olive-green. Peduncles \(\frac{1}{4}-1\) in. long, not spirally coiled. Flowers minute, in pairs, enclosed in a leaf-sheath. Stipes of carpels rapidly lengthening after flowering up to 1 in. long, spreading and forming an umbellate head of achenes. Achenes \(\frac{1}{12}-\frac{1}{16}\) in. long, beaked; endocarp hard. Fl. B. I. v. 6, p. 568; Reichb. Icon. Fl. Germ. v. 7 (1845) p. 10, t. 17, fig. 25; Trim. Fl. Coyl. v. 4, p. 374; Syme, Eng. Bot. ed. 3, v. 9 (1869) p. 59, t. 1428; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Prain, Beng. Pl. p. 1124. ? Zostera marina, Dalz. & Gibs. Bo. Fl. (1861) p. 277 (not of Linn.).

Stocks without locality in Herb. Kow.! Konkan: Salt-works at Nathay, Stocks!; Mahim near Bombay, Woodrow.—Distrin. Throughout India in brackish water; Ceylon, Temperate Europe and Tropical Asia.

4. ZANNICHELLIA, Linn.

Aquatic submerged herbs growing in brackish or fresh water; rootstock slender; stem slender. Leaves linear, with stipular sheaths. Flowers minute, monocious, both sexes in one membranous sheath. Male flowers: Perianth 0. Stamen solitary; filament filiform; anther linear, 2-3-celled. Female flowers: Perianth capular, hyaline. Carpels 2-9, sessile; ovule solitary in each carpel, pendulous, orthotropous; style rather long, slender; stigma oblique, peltate. Fruit of sessile or stipitate subreniformly incurved achenes usually 4 in number. Seed pendulous; testa thin; embryo subcylindric, with the cotyledonary end folded twice on itself.—Distrib. Species 4-5, but probably all forms of one species.

1. Zannichellia palustris, Linn. Sp. Pl. (1753) p. 969. Sub-sp. pedicellata, Syme, Eng. Bot. ed. 3, v. 9 (1869) p. 57, t. 1426. Stems very slender, filiform. Leaves 1-3 in. long, all submerged, alternate or opposite, narrowly linear or filiform. Flowers minute, subsessile, enclosed in the leaf-sheaths. Filament of the male flowers at first short, afterwards elongating. Peduncles in the Sind specimen (the only specimen from the Bombay Presidency that I have seen) reaching $\frac{1}{10}$ in. long. Achenes distinctly stipitate, about $\frac{1}{10}$ in. long including the beak (which is about half as long as the body of the achene), subreniformly incurved, crested on the back. Fl. B. I. v. 6, p. 568; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Prain, Beng. Pl. p. 1124.

Rare. Drccan: Poona, Mula River, Woodrow. Sind: Dalzell! Dalzell does not state whether his specimens grew in brackish or fresh water. His specimens merely bear the ticket "Zannichellia Scinde."—Distrin. Salt-marshes and less commonly in fresh water, throughout India; most temperate and subtropical regions.

5. NAIAS, Linn.

Annual submerged herbs growing in fresh or brackish water; stems rooting from the nodes, branched, filiform, smooth or muricate. Leaves sessile, opposite, alternate or whorled, narrowly linear, sinuate-dentate or serrulate. Flowers minute, axillary, 1-sexual, monœcious (rarely diœcious). Male flowers: Perianth double, the outer tubular or inflated, entire or 4-fid, the inner hynline. Stamen solitary, adnate to the inner perianth-tube; anther apiculate or cuspidate, usually 4 (rarely 1)-celled. Female flowers: Perianth 0, or hynline and adnate to the carpel. Carpel solitary, sessile, 1-ovulate; ovule basal, erect, anatropous. Fruit an oblong achene. Seed erect; testa very thin; embryo straight.—Distrib. Throughout the world except in Arctic regions; species 31.

1. Naias minor, All. Fl. Pedem. v. 2 (1785) p. 221. A small plant, growing in fresh water, $1\frac{3}{4}$ -10 in. high; stem slender, much dichotomously branched; internedes short, smooth. Leaves $\frac{3}{6}$ - $\frac{7}{6}$ in. long, scarcely $\frac{1}{2}d$ in. broad, narrowly linear, the upper recurved, with 6-12 spreading teeth on each margin; sheaths truncate, rounded. Flowers fasciculate, monecious, the male and female often found in successive leaf-axils. Male provers about $\frac{1}{16}$ in long. Anthers 1-celled. Finally provers about $\frac{1}{16}$ in, long. Style long; stigmas 2, unequal. Achenes $\frac{1}{12}$ - $\frac{1}{6}$ in long. Seed narrowly ellipsoid, pitted. Fl. B. I. v. 6, p. 569; Trim. Fl. Ceyl. v. 4, p. 376; Rendle, in Trans. Linn. Soc. ser. 2, v. 5, p. 410 (1899), & in Engler, Pfanzenreich, v. 4, part 12,(1901) p. 14 and p. 2, fig. 1, D-F; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 429; Prain, Beng. Pl. p. 1124. Naias indica, Cham. in Linnæa, v. 4 (1829) p. 501; Dalz. & Gibs. p. 277.

DECCAN, Poona, Woodrow.

This has been included on the authority of Woodrow, who gives Poona as the habitat of the plant. I have seen no specimens from Bombay; there are none in Herb. Kew.—Distrib. More or less throughout India in still fresh water; Ceylon, Old World generally.

ORDER CXLV. ERIOCAULACEÆ.

Annual or perennial scapigerous marsh (rarely aquatic) herbs. Leaves narrow, with sheathing bases; veins parallel. Flowers 1-sexual, usually monoccious, minute, mostly white, densely aggregated in a solitary globose or hemispheric head at the apex of a peduncle with a tubular basal sheath; heads androgynous (rarely 1-sexual), with an involucre of short 2-many-seriate imbricate scarious or chartaceous bracts, often radiating beyond the circumference of the flowering part of the head; the florets often more or less heary with short white hairs, and closely packed on a flat, convex, hemispheric, or conical receptacle, each floret solitary in the axil of a cuneiform bract which equals or exceeds its floret, and is usually dorsally hoary near the apex (rarely absent). Corolla usually separated from the calvx by a distinct stipes, sometimes rudimentary, especially in the male flowers (rarely absent). MALE Thowers: sepals usually 3, free or connate, deciduous (rarely 2 or 0). Petals usually 3, connate in a stipitate funnel-shaped minutely 3-lobed corolla, one lobe sometimes longer than the others. Stamens 6 or fewer, inserted on the corolla; filaments short, often unequal; anthers didymous, 2-celled, usually black. Pistillode 0 or reduced to minute glands. Female Plowers sessile or stipitate. Sepals 2-3 (rarely 1 or 0), unequal, usually concave, deciduous. Petals usually 3, unequal, broad or narrow, often ciliate or hairy, frequently with a dark glandular spot on the inner face. Ovary superior, sessile or stipitate, globose, 2-3-celled; ovary solitary in each cell, pendulous; style-branches 2-3, filiform. Fruit a small membranous 2-3-celled localicidal capsule. Seeds minute, oblong, ellipsoid or globose, smooth, striate, or ribbed; albumen floury; embryo minute.—DISTRIB. Genera 9, according to Ruhland [Monog. Eriocaul. in Engler, Pflanzenreich, v. 4, part 30 (1903)]; species about 370, in the warmer regions of both hemispheres, most numerous in Tropical America, few in temperate regions.

1. ERIOCAULON, Linn.

Marsh or aquatic herbs; stem usually very short or 0, rarely elongate. Leaves linear, membranous, often fenestrate. Male and female flowers generally mixed in the same, rarely in separate heads. Male flowers: Sepals 2-3; free or often more or less united into a split spathe (rarely absent). Petals 2-3, at the apex of the tube, sometimes with a black gland on the inner face, sometimes rudimentary or absent. Stamens twice as many as the petals or by abortion fewer; anthers 2-celled, usually black. Female flowers: Sepals usually free, mostly unequal, concave, boat-shaped or flattened, often bearded on the apical part or ciliate. Petals 2-3, always free (rarely absent), often with a black gland on the inner face a little below the apex.—Distrib. Warmer parts of both hemispheres in marshy places, North Asia, China, Japan, N. America, Africa, Australia, one species in the British Isles, otherwise absent from Europe; species about 200.

Aquatics; stems elongate, floating, branched.

Leaves capillary, 1-nerved 1. E. sctaccum.
Leaves linear, 4-7-nerved 2. E. rivulare.

Terrestrial or marsh plants; stems short or 0. Petals of male flowers 3, one much the largest and protruded beyond the floral bracts; involueral bracts orbicular; floral bracts bearded.	
Receptacle villous; heads snowy-white; anthers black; plant with an odor of chamonule	3. E. odoratum.
inodorous Petals of male flowers subequal or one rather larger, none produced beyond the floral bracts. Involueral bracts woolly or hairy; receptacle villous.	4. E. breviscapum.
Leaves linear, 3\frac{1}{2}-8 in, long; peduncles conspicuously 7-ribbed, usually twisted; petals of male flowers unequal	5. E. Wightianum,
Leaves lanceolate, 1-2½ in. long; peduncles slightly 6-ribbed, scarcely twisted; petals of male flowers subequal	6. E. lanceolatum.
Receptacle glabrous or nearly so; peduncles glabrous, 5-ribbed	
Plant reaching 8 in. high; peduncles 4-ribbed, hairy Plant 1-2½ in. high; peduncles obsoletely ribbed,	8. E. stellatulum.
glabrous	9. E. minutum.
Receptacle sparsely hairy or glabrous. Receptacle sparsely hairy; leaves 4 in. and more long; peduneles 5-ribbed; sepals 3.	10. E. sexangulare.
Recoptacle glabrous; leaves less than 4 in. long; peduncles 7-ribbed; sepals 2 Receptacle villous. Seeds closely transversely (microscopically)	11. E. cuspidatum.
ridged. Involucral bracts crect or spreading, never reflexed; heads pale grey,	
homispheric, with truncato base; floral bracts subscute	12. E. luzulæfolium.
liends dark grey, subglobose; floral bracts subacute	13. E. trilobum.
involucral bracts reflexed; heads palo grey or snowy white, globosely ovoid; floral bracts acquimate	14. E. quinquangulare,
longer than the flowering part of the head, shining, pale yellow or nearly white	15. E. Xcranthemum.

1. Eriocaulon setaceum, Linn. Sp. Pl. (1753) p. 87. A submerged aquatic; stem 1-3 ft. long, usually simple, stout or slender, densely clothed throughout its length with capillary flexuous glabrous, pellucid, 1-nerved leaves $1\frac{1}{2}-2$ in. long; tips of stems floating. Peduncles numerous, umbellately fasciculate on the apex of the stem, $1\frac{1}{2}-4$ in. high, slender, unequal, glabrous, 6-sulcate, more or less twisted; sheath $\frac{3}{4}-1$ in. long, obliquely split at the apex, membranous. Heads subglobose, $\frac{1}{4}-\frac{1}{4}$ in. in diam., greenish-white, often quite white at the

apex; involucral bracts 15 in. long, broadly obovate or suborbicular, obtuse, concave; floral bracts obovate-cuneate, hairy on the back below the apex, membranous; receptacle villous. Male flowers: Sepals usually connate into a spathe split open in front. Corolla-tube with 3 small subequal petals at its apex, hairy with white hairs. Stamens 6, the 3 opposite the petals a little larger than the others. Thowers shortly stipitute. Sepals $\frac{1}{16}$ $\frac{1}{12}$ in. long, obovate-cymbiform, hairy on the back at the apex. Corolla shortly stipitate; petals 3, linear or linear-spathulate, narrow, ciliate with white hairs, usually with a black glandular spot on the inner face below the apex. Ovary 3lobed; style-branches 3, filiform. Seeds 1 in. long, oblong, smooth, brown. Linn. Fl. Zoyl. (1747) p. 20, n. 50 (Eriocaulon without specific name); Rheede, Hort. Mal. v. 12, p. 129, t. 68; Korn. in Linnea, v. 27 (1856) p. 603; Ruhl. in Engler, Pflanzenreich, v. 4, part 30 (1903) p. 89. Eriocaulon Capillus-naiadis, Hook. f. Fl. B. I. v. 6 (1893) p. 572; Trim. Fl. Ceyl. v. 5, p. 2; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Prain, Beng. Pl. p. 1126.—Flowers: Oct.-Dec.

KONKAN: Stocks!, Dalzell!, Woodrow.—Distrib. India (Bengal, Khasia Hills, Birma, W. Peninsula); Ceylon, Cochinchina.

I have followed Ruhland (l. c.) in making E. Capillus-naiadis, Hook. f., conspecific with E. setaceum, Linn. In the 'Flora of British India' (l. c.) E. Capillus-naiadis, Hook. f., is made conspecific with E. setaceum of Kærnicke, which is certainly that of Linneus. Ruhland restores E. intermedium, Korn., which is the E. setaceum of many authors, but not of Linneus.

2. Eriocaulon rivulare, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 280. Stem simple, elongate, submerged, densely leafy. Leaves linear, flat, all along the stem, somewhat crowded at its apex, 4-9 by in., attenuated into a subulate acumen, dilated at the base, fenestrately 4-7-nerved, opaque, rigid. Peduncles numerous, umbellately fasciculate on the top of the stem, 7-18 in. high, 8-10-sulcate, glabrous, twice as long as the leaves; sheaths tubular, 2-3 in. long, multi-striate, glabrous, shortly split at the apex. Heads globose, reaching 4 in. in diam., snowywhite; involucral bracts 10 in. long, broadly obovate-oblong, lacerate at the apex; floral bracts $\frac{1}{10}$ in long, oblanceolate-oblong, subscute, hyaline, hairy on the back below the apex; receptacle columnar, hairy. MALE FLOWERS: Sepals 3, all free, 1, 1/2 in. long, or connate into a spathe split in front. Corolla-tube, 1/5 in. long; petals 3, spathulate, about in long, subequal, with a black glandular spot, densely hairy. Stamens 6, those opposite the petals the longest; anthers white. FEMALE FLOWERS: Sepals 3, linear, acute, puberulous on the back. Petals 3, linear-spathulate, $\frac{1}{12} \cdot \frac{1}{10}$ in. long, obtuse, white, with a black spot below the apex, hairy. Ovary 3-lobed; style-branches 3, filiform. Seeds globose, smooth. Dalz. & Gibs. p. 280; Ruhl. in Engler, Pflanzenreich, v. 4, part 30 (1903) p. 91. Eriocaulon Dalzellii, Kærn. in Linnea, v. 27 (1856) p. 605; Dalz. & Gibs. p. 316; Hook. f. Fl. B. I. v. 6, p. 580; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429.— Flowers: Oct.-Dec.

Konran: Stocks!; Malwan in streams, Dalzell!-Distrib. India (W. Peninsula). The specific name rivulare originally given to the plant by Dalzell (1851) was changed into Dalzellii by Kærnicko (l. c.) on account of the name rivulare having been preoccupied by Don (1849). But Don's plant is now E. latifelium, Smith (1809), so that Dalzell's name has been restored.

3. Eriocaulon odoratum, Dalz. in Kew Joven. Bot. v. 3 (1851) p. 280. Stemless or nearly so. Leaves 1-3 by $\frac{1}{12}$ - $\frac{1}{3}$ in., linear-subulate, cospitose, erect or recurved, fenestrately 6-9-nerved, glabrous, translucent. Peduncles few or many, unequal, 4-8 in. high, slender, glabrous, twisted, 5-6-ribbed; sheaths 1-22 in. long, close, obliquely split. Heads subglobose, 1-1 in. in diam., snowy-villous; involucral bracts 15 in. long, broadly obovate-cuneate, glabrous, at length lacerate at the apex; floral bracts 1 in. long, rhomboid-obovate, cuneate, acuminate, hairy on the upper part of the back with opaque white hairs; receptacle pilose, MALE FLOWERS: Sepals 3, cuneate-oblong, narrow, subobtuse, free or often connate into a spathe split in front, white-hairy on the upper part of the back. Corolla-tube 15 in. long; petals very unequal, hairy, each with a black spot. Anthers black. FLMALE FLOWERS stipitate. Sepals 2, lanceolate, acute, boat-shaped, 10 in. long, pilose. Petals 3, one larger than the other two, $\frac{1}{20-10}$ in, long, narrow, linear-spathulate, hairy with white opaque hairs and with a black spot on each. Style-branches 3, long, filiform. Fl. B. I. v. 6, p. 574; Dalz. & Gibs. p. 280; Kærn. in Linnæa, v. 27 (1856) p. 683; Woodr. in. Journ. Bomb. Nat. v. 13 (1901) p. 429; Ruhl. in Engler, Pflanzenreich, v. 4, part 30 (1903) p. 110.-Flowers: Sept.

Konkan: Stocks!, Woodrow, Malwan in stagnant water, Dalzell! Kanara: Kulgi (N. Kanara), Talbot, 1837!; Karwar, Talbot, 2949!; Supa on the Kala naddi, Talbot, 2948!—Distrib. India (W. Peninsula).

The plant is described by Dalzell as smelling strongly of chamomile.

4. Eriocaulon breviscapum, Karn. in Linnaa, v. 27 (1856) p. 676. Plant 6-15 in. high, growing in still water; root of numerous glabrous slender white fibres; stem almost 0. Leaves cospitose (? floating), 6-15 by $\frac{1}{8}$ - $\frac{1}{5}$ in., linear, subobtuse, glabrous, flat, opaque, conspicuously 7-11-nerved. Peduncles shorter or longer than the leaves, solitary (? or few), 6-8 in. high, glabrous, erect, not or scarcely twisted; sheaths 2-4 in. long, obliquely split. Heads globose or hemispheric, $\frac{1}{4} - \frac{8}{8}$ in. in diam., densely white-villous at the apex, the lower portion of the head dark brown; involucral bracts 1 in. long, broadly ovate or obovate, obtuse, glabrous, membranous; storal bracts of in. long, linear-oblong, acute, very hairy on the upper part with white hairs. MALE FLOWERS stipitate. Sepals 3, obovate-oblong, obtuse, 1 in long, slightly unequal, hairy at the top. Corolla-tube 10 in. long; petals slightly unequal, the longest 1 in. long, very hairy, each with a black spot. Stamens 6, those opposite the petals the longest; anthers white or pale yellow. Female Plowers very shortly stipitate. Sepals 3, oblong, concave, truncate, in long, pilose. Petals 3, narrowly linearspathulate, slightly unequal, the longest 10 in. long, all densely hairy with white hairs and with a black spot. Ovary 3-lobed, shortly stipitate; style-branches 3, filiform. Seeds subglobose, pale yellow, shining. Fl. B. I. v. 6, p. 575; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Ruhl. in Eugler, Pflanzenreich, v. 4, part 30 (1903) p. 70.—Flowers: Dec.-Feb.

Rarc. KANARA: Tinai Ghát (2000 ft), Talbot, 1379!; Anmod (N. Kanara), Talbot, 1600!.—Distrate. India (W. Peninsula).

There are only 2 sheets in Herb. Kow., both from N. Kanara.

- 5. Eriocaulon Wightianum, Mart. in Wall. Pl. As. Rar. v. 3 (1832) p. 28. Stem short or elongate, often as thick as the thumb. Leaves exspitose, $3\frac{1}{2}$ -8 by $\frac{1}{4}$ - $\frac{5}{8}$ in., linear, obtuse or subobtuse, glabrous or nearly so, flat, many-nerved, scarcely fenestrate. Peduncles strict. aggregated, 6-15 in. high, conspicuously about 7-ribbed, glabrous or sparsely hairy, usually twisted; sheaths 2-4 in. long, obliquely and deeply split, sparsely hairy, ribbed. Heads 1-1 in. in diam., globose, densely white-villous; involucial bracts 1-1 in. long, cuneate-obovate, the outer obtuse, the inner subacute, bairy at the back in the upper part. ultimately reflexed; floral bracts 1 in. long, rhomboid-cuneate or obovatecuncate, acuminate, densely clothed with white hairs in the upper part; receptacle pilose. Male flowers stipitate. Sepals 3, obovate-oblong, cuneate at the base, free or connate into a spathe, hyaline, the tips pubescent. Corolla-tube $\frac{1}{\sqrt{n}}$ in long; petals all densely hairy at the apex and without a black spot, one slightly larger than the other 2, about 1 in. long. Stamens 6; anthers black. FEMALE PLOWERS sessile or very shortly stipitate. Sepals 3, free, slightly unequal, linear-obovate, bearded towards the tip. Petals \(\frac{1}{10}\) in. long, narrowly linear-spathulate, villous with long white hairs and with a minute black spot. Ovary sessile, 3-lobed; style-branches 3, filiform. Seeds about 1 in. long, ellipsoid, dark reddish-brown, smooth, minutely papillose. Fil. B. I. v. 6, p. 576; Wall, Cat. 6067; Kern, in Linnea, v. 27 (1856) p. 658; Trim. Fl. Ceyl. v. 5, p. 8; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Ruhl. in Engler, Pflanzenreich, v. 4, part 30 (1903) p. 75.—Flowers: Oct.-Nov. Dalzell without locality in Herb. Kew. Konkan: Stocks! Kanara: Falls of Gairsoppa, Talbot, 771 !- DISTRIB. India (Birma, W. Peninsula); Ceylon.
- 6. Eriocaulon lanceolatum, Miq. ex Stevd. Syn. Pl. Cyp. part 2 (1855) p. 271. Plant 4-8 in. high; stem very short. Leaves cospitose, erect, 1-23 by 1-1 in., oblong-lanceolate, subscute, glabrous, thinly membranous, translucent, many-nerved. Peduncles few, 3-8 in. high, slender, slightly 6-ribbed, scarcely twisted, glabrous; sheaths lax, 1-24 in. long, obliquely split, glabrous. Heads subglobose, white-villous; involucral bracts 15 in. long, broadly obovate or quadrate, obtuse, scarious, not reflexed, hairy on the back in the upper part, ciliate at the apex; floral bracts cuneate-oblong, obtuse, hairy on the back; recentacle villous. Male Flowers: Sepals 3, boat-shaped, $\frac{1}{20}$ - $\frac{1}{10}$ in long. Corollatube 1 in. long; petals 3, minute, subequal, each with a black spot. Stamens 6; anthers black. Female flowers sessile. Sepals 3, of which 2 are deeply boat-shaped, $\frac{1}{10} - \frac{1}{5}$ in. long, the other flat, one of the sepals sometimes winged at the back. Petals 3, unequal, 10 in. long, linear-lanceolate, acute, with a small spot, pubescent. Ovary deeply 3lobed; style-branches 3, slender. Seeds $\frac{1}{10}$ in. long, slightly ribbed, broadly oblong, reddish-brown. Fl. B. I. v. 6, p. 577; Kærn. in Linnæa, v. 27 (1856) p. 656; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Ruhl. in Engler, Pflanzenreich, v. 4, part 30 (1903) p. 78.-Flowers: Oct.-Nov.

Rare. Konkan: Stocks! Kanara: Supa, Talbot, 2947!—Distrib. India (W. Peninsula).

7. Eriocaulon Sieboldianum (Sieboldianum), Sieb. & Zuce. ex-Steud. Syn. Pl. Cyp. part 2 (1855) p. 272. A low stemless tufted

annual scarcely reaching 6 in. high. Leaves 1-21 by 10-10 in. narrowly linear, subulate, glabrous, opaque or translucent, few-nerved. Peduncles numerous, aggregated, glabrous, 3-6 in. high, slender, 5ribbed; sheaths 1-1 in. long, obliquely split, glabrous, shorter than the leaves. Heads small, $\frac{1}{8} - \frac{1}{5}$ in. in diam., whitish or purplish, globose or ovoid; involucral bracts $\frac{1}{10^{-5}}$ in. long, the outer oblong, obtuse, the tip often lacerate, the inner narrower, all scarious, spreading or ascending. glabrous, pale; floral bracts $\frac{1}{10}$ in long, linear-oblong or oblonglanceolate, obtuse or subacute, closely imbricating, hyaline, glabrous, shining, often with a broad central purplish band; receptacle columnar, glabrous or nearly so. MALE FLOWERS stipitate. Sepals connate into a glabrous cucullate spathe, split in front, 3-toothed at the apex. Corollatube 1 in. long; petals minute, narrow, subequal. Stamens 6; anthers rotund, white. Female flowers stipitate. Sepals usually 2, free. narrowly linear, acute, hyaline, glabrous, decidnous. Petals 0. Ovary stipitate, the stipes with a node at the position of the petals, 3-lobed: style-branches 3, filiform. Seeds about $\frac{1}{60}$ in. long, ellipsoid, smooth, reddish-brown, shining. Fl. B. I. v. 6, p. 577; Trim. Fl. Ceyl. v. 5, p. 10; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Ruhl. in Engler, Pflanzenreich, v. 4, part 30 (1903) p. 111; Prain, Beng. Pl. p. 1126. Eriocaulon sewangulare, Mart. in Wall. Pl. As. Rar. v. 3 (1832) p. 28 (not of Linn.); Grah. Cat. p. 231; Dalz. & Gibs. p. 279; Korn. in Linnea, v. 27 (1856) p. 613.—Flowers: Sept.

8. Eriocaulon stellatulum, Karn. in Linnaa, v. 27 (1856) p. 620. Plant reaching 8 in. high; stem scarcely any. Leaves 1-3 by $\frac{1}{4}$ - $\frac{1}{2}$ in., broadly linear, subscute, tapering from the base to the tip, many-nerved, flat, glabrous, membranous. Peduncles 2-8 in. high, slender, 4-sulcate, hairy with spreading hairs; sheaths 1-1; in. long, obliquely split, with a long acuminate tip, glabrous or slightly hairy near the base. Heads 1-1 in. in diam., globose, stellately echinulate from the long spreading bracts, glabrous, white; involucial bracts $\frac{1}{5} - \frac{1}{6}$ long, ovate, acuminate, at length reflexed; floral-bracts $\frac{1}{6}$ in long, narrowly . glabrous, stellately spreading, much exceeding the flowers; receptacle pilose. MALE PLOWERS scarcely stipitate. Sepals 2, free or connate, i 1/2 in. long, obliquely obovate, acute, glabrous, hyaline. Corolla-tube scarcely 10 in. long; petals minute, subequal, with a dark spot. Stamens 6; anthers black. Female flowers sessile. Sepals 3, falcately ovate, $\frac{1}{10}$ in long, with a long subulate ultimately recurved acumen, dorsally crenately winged, glabrous, white. Petals 3, linear-spathulate, on in. long, obtuse, hairy, usually with a black spot. Ovary sessile, 3-lobed; style-branches 3, filiform. Seeds $\frac{1}{30}$ in. long, globosely ellipsoid, smooth, shining, chestnut-brown. Fl. B. I. v. 6, p. 579; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Ruhl. in Engler, Pflanzenreich, v. 4, part 30 (1903) p. 97.—Flowers: Feb.

9. Eriocaulon minutum, Hook. f. Fl. B. I. v. 6 (1893) p. 579. A small densely tufted herb $1-2\frac{1}{2}$ in. high. Leaves $\frac{1}{2}-\frac{3}{4}$ in. long, subulate

or filiform, acute or obtuse, compressed, opaque, 3-5-nerved, base dilated and sparsely woolly within. Peduncles 1-21 in. high, capillary, flexuous, numerous, aggregated, obsoletely ribbed, slender, glabrous. slightly twisted; sheaths rather lax, $\frac{1}{1-\frac{3}{6}}$ in. long, obliquely split. Heads $\frac{1}{10}$ in. in diam., white, shining, glabrous; involucial bracts $\frac{1}{10}$ in. long, erect, ovate-lanceolate, acuminate; floral bracts shorter, oblanceolate, neute or cuspidate; receptacle small, columnar, glabrous or sparsely villous. MALE FLOWERS: Sepals connate into a spathe split in front. irregularly 3-toothed, pale, glabrous. Petals minute, almost 0. Stamens 3-6: anthers black. FEMALE FLOWERS subsessile. Sepals 2, with rarely a filiform third one, boat-shaped, concave, falcately curved, acute, winged or keeled on the back, glabrous, the keel or wing spinulose. Ovary 2-3-lobed, subsessile; style-branches 3, very short. Seeds oblong. Woodr, in Journ, Bomb, Nat. v. 13 (1901) p. 429; Ruhl. in Engler, Pflanzenreich, v. 4, part 30 (1903) p. 111.

Rare, Konnan: Stocks!-Distrib. India (W. Peninsula).

10. Eriocaulon sexangulare, Linn. Sp. Pl. (1753) p. 87. A tall stout herb; stem as thick as the little finger or less, short (rarely elongate). Leaves erect, cospitose, 4-12 in. long by $\frac{1}{4}$ - $\frac{3}{4}$ in. wide at the base, linear, narrowed from the base to the subacute or acuminate tip. thin, many-nerved, opaque, drying brown. Peduncles many, stiff, up to 18 in. high, 5-ribbed, more or less twisted; sheaths 3-6 in. long, obliquely split, herbaceous, with a long green acumen. Heads 1-3 in. in diam., globose, hemispherical or cylindric-ovoid (sometimes viviparous), hard, hoary, with truncate base; bracts imbricate, closely appressed, concealing the flowers, those of the involucre 1 in, long, subquadrate, orbicular or obovate, acute, glabrous, yellow, shining, the floral bracts 1 in. long, cuneate-obovate, with a sudden short triangular acumination; receptacle globose, columnar or hemispheric, sparsely hairy. FLOWERS quite flat. Sepals free or connate, 15 in. long, boat-shaped, winged, glabrous. Corolla-tube $\frac{1}{20}$ in. long; petals minute, triangular, ciliate, usually with a small black spot. Stamens 6; anthers black. FIMALE FLOWERS sessile. Sepals 3, free, 2 of which are large, boatshaped, acute, 10 h in. long, dorsally broadly winged, the third small, linear, flat, all glabrous. Petals filiform, terminated by a pencil of long hairs. Ovary subsessile: style-branches 3, filiform. Seeds subglobose. ribbed, the ridges papillose. Fl. B. I. v. 6, p. 580; Trim. Fl. Cevl. v. 5, p. 5; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 429; Ruhl. in Engler, Pflanzenreich, v. 4, part 30 (1903) p. 110. Eriocaulon Wallichianum, Mart. in Wall. Pl. As. Rar. v. 3 (1832) p. 27, t. 249; Kærn. in Linnæa, v. 27 (1856) p. 687; Dalz. & Gibs. p. 280.—Flowers: Sept.

11. Eriocaulon cuspidatum, Dalz. in Kew Journ. Bot. v. 3 (1851) p. 281. Stemless. Leaves exspitose, erect, $1-3\frac{1}{2}$ by $\frac{1}{6}-\frac{1}{4}$ in., linear-oblong, rounded and cuspidate at the apex, glabrous, translucent, fenestrately 7-9-nerved. Peduncles 6-12 in. high, fasciculate, few or many, 7-sulcate; sheaths reaching sometimes 4 in. long, obliquely split, glabrous. Heads $\frac{1}{6}-\frac{1}{4}$ in. in diam., hemispheric or subglobose, white-puberulous; involucial bracts $\frac{1}{10}$ in. long, broadly oboyate-cuneate,

obtuse, concave, glabrous; floral bracts similar; receptacle glabrous. Make flowers: Sepals 2, free, τ_0^1 in. long, obovate-lanceolate, acute, deeply concave, hyaline, slightly winged and puberulous on the back. Corolla-tube τ_0^1 in. long; petals small, unequal, with a conspicuous black spot, hairy. Stamens 6; anthers black. Female flowers: Sepals 2, elliptic-lanceolate, acute, $\tau_0^1 = \tau_0^1$ in. long with a pubescent rounded crest-like wing on the back. Petals 3, unequal, narrowly linear-lanceolate, fimbriately villous towards the tip and with a conspicuous black spot. Ovary 3-lobed; style-branches 3, filiform. Seeds oblong, quite smooth. Fl. B. I. v. 6, p. 581; Dalz. & Gibs. p. 280; Korn. in Linnaa, v. 27 (1856) p. 684; Ruhl. in Engler, Pflanzenreich, v. 4, part 30 (1903) p. 104; Woodr. in Journ. Bomb. 12. Eriocaulon luzulæfolium, Mart. in Wall. Pl. As. Rar. v. 3 (1832) p. 28. A herb 4-10 in. high; stems stout or slender, sometimes as thick as a swan's quill, with many fibrous glabrous whitish roots. Leaves cospitose, 1-3 by I in. in the middle, linear-lanceolate, narrowed from the base to the tip, subacute, glabrous, flat, opaque or translucent, fenestrately 10-12-nerved near the base. Peduncles 3-10 in. high, numerous, erect, glabrous, 5-sulcate, twisted; sheaths 1-2 in. long, obliquely split, at length lacerate at the mouth, glabrous. more or less striate. Heads $\frac{1}{h}$ in. in diam., hemispheric, hard, pale grey, pubescent, base truncate; involucral bracts about 10 in. long, conspicuous, oblong-obovate, cuneate, obtuse, concave, subcoriaceous, glabrons, shining, never reflexed; floral bracts narrower, 10 in. long, spathulate-oblong, subacute, shortly pubescent at the apex; receptacle conical or columnar, villous with long hairs. MALE FLOWERS stipitate. Sepals 3, oblong-obovate, concave, $\frac{1}{2\sigma-1}$ in. long, obtuse or subacute, ciliate at the tips, free or two counate. Corolla-tube about $\frac{1}{2\sigma}$ in. long; petals minute, equal, without a glandular spot. Stamens 6; anthers black. Female rlowers shortly stipitate. Sepals 3, linear-oblong, falcate, concave, acute, dorsally tipped with bristly hairs. Petals 3, linear-lanceolate, 1/2 in. long, ciliate, without a glandular spot. Ovary subsessile, 3-lobed; style-branches 3, filiform. Seeds ellipsoid, orangeyellow, faintly ribbed and very closely microscopically transversely ridged. Fl. B. I. v. 6, p. 582; Trim. Fl. Ceyl. v. 5, p. 7; Kærn. in Linnea, v. 27 (1856) p. 636; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 429; Prain, Beng. Pl. p. 1126; Ruhl, in Engler, Pflanzenreich; v. 4, part 30, p. 88.

13. Eriocaulon trilobum, Buch.-Ham. in Wall. Cat. (1828) 6072, D. A stemless herb of rice-fields and wet places. Leaves erect, coespitose, green, $1\frac{3}{4}-4\frac{1}{2}$ by $\frac{1}{10}-\frac{1}{4}$ in., linear, narrowed towards an acute or subobtuse apex, glabrous, flat, fenestrately 9-11-nerved, not drying red. Peduncles numerous, 3-8 in. high, glabrous, 5-6-ribbed, twisted; sheaths $\frac{3}{4}-2$ in. long, obliquely split, somewhat lax, striatulate. Heads $\frac{1}{8}-\frac{1}{10}$ in. in diam., subglobose, dark grey; involueral bracts $\frac{1}{8}$ by $\frac{1}{10}$ in., linear-oblong, obtuse, glabrous, at first radiating beyond the head,

afterwards reflexed, pale, shining; floral bracts $_{1}^{1}$ -in.long, cuncate-obovate, obtuse or subacute, not acuminate, ciliate at the apex, concave; receptacle villous. Male flowers shortly stipitate. Sepals 3, oblong, obtuse, $_{15}^{1}$ in. long, connate into a spathe glabrous. Corolla-tube $_{25}^{1}$ in. long; petals minute. Stamens 6; anthers black. Female flowers subsessile. Sepals 3, oblanceolate, boat-shaped, $_{15}^{1}$ in. long, hairy on the back. Petals 3, free, narrowly spathulate, hairy above and with a black spot. Ovary subsessile, 3-lobed; style-branches 3, filiform. Seeds about $_{50}^{1}$ in. long, ellipsoid, microscopically closely transversely ridged, pale yellow. Fl. B. I. v. 6, p. 583; Kærn. in Linnæa, v. 27 (1856) p. 645; Woodr. in Jonen. Bomb. Nat. v. 13 (1901) p. 429; Prain, Beng. Pl. p. 1127 Ruhl. in Engler, Pflanzenreich, v. 4, part 30 (1903) p. 74. IMPERIECTLY KNOWN SPECIES.

ERIOCAULON BOMBAYANUM, Ruhl. in Engler, Pflanrenreich, v. 4, part 30 (1903) p. 104. Stom very short. Leaves linear-lanceolate, acute, 1-1 by 1-1, in. Peduncles many, 31-4 in. high; sheaths as long as the leaves. Heads globose or globosely cylindric, densely snowy-puberulous, involueral bracts always conspicuous, lanceolate cynnario, aensely snowy-piderinious, involueral dracts always conspicuous, lanceolate or oblong-obovate, acute, green, glabrous; floral bracts oblong-obovate, acute, ciliate, dark-colored. Flowers heteromerous. Male flowers: Sepals 2, connate into a spathe to the apex, ciliate, obtuse, olive-green. Petals 3, very small, glandular. Stamens 6; anthers black. Female flowers: Sepals 2, linear, winged or keeled, acute, concave, dark-colored, ciliate. Petals 3, linear-oblanceolate, with a glandular spot, ciliate, white Ovary 3-lobed. The above is Rubland's description.

KONKAN: Bombay, Warburg, 867, in Herb. Berol. ex Ruhland. I have seen no

specimens; there are none in Herb Kew.

ERIOCAULON RITCHIEANUM, Ruhl. in Engler, Pflanzeureich, v. 4, part 30 (1903) p. 73. Stein very short. Leaves 14-24 by 25 in linear. Pedancle solitary, about 64 in high, scarcely twisted; sheaths lax, glabrous, 14 in long. Heats subglobose, white-villous at the top, 1-1 in. in duam. , involucial bracts obovate, obtuse, glabrous; floral bracts similar, acute, greyish-yellow puberulous on the back near the apex. MALE FLOWERS: Sepals connate into a spathe, very obtuse. Potals small, with a gland. Anthers white. Finale rlowers: Sepals ovate, acute, free, lax, grey-green, puberulous on the back. Petals oblong-spathulate, white, subobtuse, with a gland. Ovary 3-lobed. The above is Ruhland's description.

S. M. COUNTRY: Belgaum, Ritchie, 1248, in Herb. Boiss.-Barb. I have seen no

specimens, there are none in Herb Kew.

ERIOCAULON ROBUSTO-BROWNIANUM, Ruhl. in Engler, Pflanzonreich, v. 4, part 30 (1903) p. 77. Stem very short. Leaves exspitose, lanceolate, very obtuse, fenestrate at the base, glabrous, 8-10 in. long by 1 in. broad at the base. Peduncles numerous, twisted, subrobust, 12-16 in. high; sheaths rather loose, obliquely split; 31-41 in. long. Heads globose, snowy-white, puberulous, nearly a in. in diam.; in lucral bracts broadly obovate, the exterior obtuse, the inner acute, pale straw-col; puberulous at the back near the apex, then glabrous, at length concealed by flowers; floral bracts obovate, acuminate, rather rigid, greyish-white, a little le than the flowers. Flowers trimerous. Make Plowers: Sepals spathaceo-cond

obtuse, ciliate, gland-bearing. Anthers black. Fruale rlowers: Sepals oborate, acute, keeled, cilinte, grey, subequal. Petals narrowly oblong, gland-bearing, ciliate. The above is Ruhland's description.

KANARA: Dharwar and Bellary district (Saw. according to Ruhland, but probably a misprint for Law). I have seen no specimens; there are none in Herb. Kew.

*ERIOOAULON ROUXIANUM, Steud, Syn. Pl. Cyp. part 2 (1855) p. 270. Stemless. Leaves 1-13 in long from a broad base, linear-lanceolate, subobtuse, 9-11-nerved, subpellucid, twice as long as the tunid sheaths, which are whitish, submembranous, entire or 2-fid at the apex. Heads \(\frac{1}{2}\) in. in diam., snowy-villous; involueral bracts longer than the heads, herbaccous, erect, linear-oblong, obtuse, entire; floral bracts orate, subobtuse, ciliato at the apex. Kærn, in Linnæa, v. 27 (1856) p. 26; Dalz. & Gibs. p. 316; Ruhl. in Engler, Pflanzenreich, v. 4, part 30 (1903) p. 116. Collected in Bombay by Polydore Roux (fide Steudel). Kurnicke, who has not seen any specimens, considers the species somewhat doubtful and; as far as may be judged from the meagre description, to approach near to E. Thwaitesii, an identification which Ruhland considers doubtful.

Dalzell, who has collected and described many of the Bombay Eriocaulous, has seen neither this plant nor E. heterolepis. There are no specimens in Herb. Kew. Roux's specimens, collected in Bombay in 1832, are said to be in Delessert's Herbarium

(Lasegue, in Deless. Mus. Bot. (1845) p. 156).

EXCLUDED SPECIES.

ERIOGAULON HETEROLEPIS, Stend. Syn. Pl. Cyp. part 2 (1855) p. 271. Stemless, tufted. Leaves lanceolate from a broad base, subobtuse. Involucral bracts 2scrinte, scarious, the exterior oblong-lanceolate, deciduous, the interior ovate, obtuse, much shorter than the head; floral bracts cuneate-ovate. Sepals linear, ciliate at the apex. Fl. B. I. v. 6, p. 585; Kærn, in Linnæa, v. 27 (1856) p. 652; Dalz. & Gibs.

p. 316; Ruhl, in Engler, Pflanzenreich, v. 4, part 30, p. 74.

Plant collected by Polydore Roux near Bombay (fide Steudel). The species depends altogether on the description by Steudel, who may or may not have had Roux's specimens. Kærnicke states (l. c.) that he has seen no specimens of the plant and considers the species a very doubtful one which may have been described under another name, but, curiously enough, he has made a variety to this doubtful species in Miq. Ann. Mus. Lugd. Bat. v. 3 (1867) p. 239, which he names var. nigricans, a Java plant, which he fully describes. Ruhland (l. c.) copies Kærnicke's description of the Java plant (var. nigricans), and assigns it to E. heterolepis as a typical description of that species.

ERIOCAULON EURYPEPLON, Korn. in Linnan, v. 27 (1856) p. 685; Hook. f. Fl.

B. 1. v. 6, p. 585; Rubl. in Engler, Pflanzenreich, v. 4, part 30 (1903) p. 104. Kærnicke gives "East Indies" as the habitat of the plant which is stated to have been collected by Huegel no. 1886 (Hb. Vindob. et Zuccarini), no precise locality having been mentioned. Ruhland (l. c.) gives East Indies, Malabar, Konkan, &c. as the habitat, and Stocks, Huegel, &c. as the collectors, but there is no mention of the whereabouts of the specimens said to have been collected by Stocks. None of these are to be found in Herb. Kew., and as Stocks almost invariably sent his collections to the Kew Herbarium, I think it probable that Ruhland has made a mistake in his citation. There is, as far as I know, no evidence of the existence of the species in the Bombay Presidency.

ORDER CXLVI. CYPERACEÆ.

I Perennial (rarely annual) herbs with the habit of grasses; roots tra...us; stem terete or 3-angled, usually simple. Leaves grass-like, 21 iely 0), 3-ranked, mostly crowded at the base of the stem (the upper reac,r), with tubular sheaths which are more or less closed or the lower invit to the base: ligule 0 or a short prolongation of the mouth of the 3 x 2 14.7.

٠ ٠٠٠٠٠

sheath opposite to the blade. Inflorescence of solitary, fasciculate, paniculate or spicate spikelets, composed of small distichously or spirally imbricate scales (glumes); flowers minute, 1-2-sexual, in the axils of the glumes. Perianth 0, or of 2 or more hypogynous bristles or scales (ovary enclosed in a utricle in Carca). Stamens 1-3; filaments flattened; anthers basifixed, linear. Ovary 1-celled; ovule solitary, basal, erect, anatropous; style short or long; stigmas 2-3. Fruit a compressed or trigonous nut. Seed erect, free; embryo minute, within the base of the floury albumen.—Distrib. Genera about 65; species about 3000, universally distributed.

Nut not enclosed in a utricle. Flowers 2-sexual, solitary in the glumes of a simple spikelet. Flowering glumes all distichous. Fruit-bearing glumes not winged on the keel. Spikelets many-flowered 1. Cypraus. 2. Kyllinga. 3. Courtoisia. Spikelets 1-2-flowered Fruit-bearing glumes with winged keels Flowering glumes all spirally imbricate or the lower only distichous. Spikelets many-flowered. Hypogynous bristles or scales 0. Style-base swollen, disarticulating from 4. Fimbristylis. Style-base persistent, leaving a tumour 5. Stenophyllus. on the nut Hypogynous bristles or scales present. Nut with hypogynous bristles. 6. Eleocharis. Style-base swollen Style-base not swollen Scinrus. Nut with hypogynous scales. Hypogynous scales 6, divided to the base into linear segments; 8. Emophonum. stigmas 3..... Hypogynous scales not divided into segments. Hypogynous scales 6 or 3 or 0, petal-like; stigmas 3...... 9. Fuirena. Hypogynous scales 2, lateral, bracteolo-like; stigmas 2 ... 10. Hypolythum. Spikelets few-flowered. Flowers 1-sexual; nut stipitate, bony; scales or bristles 0. 13. Scheria-Nut enclosed in a bottle-shaped utricle with an entire or

1. CYPERUS, Linn.

Perennial (rarely annual) glabrous herbs; rhizome creeping, short or long or 0. Leaves mostly towards the base of the stem, occasionally reduced to sheaths. Spikelets in solitary globose or umbellate heads or spikes; involucial bracts 1 or more, foliaceous; bracteoles under the secondary divisions of the inflorescence; rhachilla usually persistent, not or in a few species disarticulating towards the base, sometimes with membranous wings derived from the persistent glume-bases. Glumes distichous, the 2 lowest empty, those above 2-sexual, all nearly equal, deciduous from below upwards, the uppermost 1-3 sterile or empty; hypogynous scales or bristles 0. Stamens 1-3; anthers linear or oblong.

Ovary compressed; style short or long or obsolete; stigmas 2 or 3. Fruit trigonous, triquetrous, obovoid, or plano-convex.—DISTRIB. All warm and temperate regions; species about 360.

I have followed Bocckeler in including under the genus Coperus the genera Pycreus, Juncellus, and Mariscus, a course followed by Pax (Engl. & Prantl, Pilanzenf.). The late Dr. Trimen in his 'Flora of Ceylon' continued by Sir Joseph Hooker includes the first two genera in Cyperus, but retains Mariscus as a distinct genus. The generic distinction in that genus, however, viz. the disarticulation of the rhachilla of the spikelots above the 2 lowest glumes, cannot be applied in the field, but may be said to be limited to herbarium specimens. In a recently published pamphlet by Dr. N. L. Britton, Director-in-Chief of the New York Botanical Gardens, "The Sedges of Jannica" [Bulletin of the Department of Agriculture of Janaica, vol. 5, Supplement 1 (1907)], that botanist makes the following remarks on page 1:—"I have accepted the generic limits outlined by Mr. Clarke with the exception of his treatment of Cyperus and its segregates, where I have accepted the view of previous authors in taking Cyperus in its broad sense rather than recognizing the genera Pycreus, Mariscus, and Torulinium, as I believe the characters depended on by Mr. Clarke for the maintenance of these genera are too vague for satisfactory use."

Stigmas 2. Fruit a laterally compressed nut.		
Superficial cells of the nut longitudinally oblong or elliptic. Nut often appearing zonate or muricate		
by reason of the thickened ends of the cells running		
into an undulating or broken horizontal line.		
Spikelets lanceolate, 20-60-flowered; nut obovoid	,	(1 Intraniantus
Spikelets linear-oblong with exactly parallel sides,	1.	C. latespicatus.
20-flowered; nut globosely oroid, brown	2.	C. malabaricus.
Superficial cells of the nut nearly square. Nut often		
appearing regularly dotted by reason of the light		
reflected from the convex surface of each cell. Stems often clothed for 1-3 of their length by		
leaf-sheaths, decumbent at the base; rhizome		
creeping, 4-10 in. long	3.	C. sanguinolentus.
Stems enveloped in leaf-sheaths only a little way		
above the base, creet; roots fibrous. Annuals.		
Stems tufted.		
Spikelets 6-10-flowered; rhachilla winged;		
statuens 2-3	4.	C. hyalinus.
Spikelets 20-50-flowered; rhachilla not		
winged. Stamen 1; nut 10 in. long	5	C. pumilus.
		C. globosus,
Stem robust, solitary or subsolitary.		·
Nut 1, in, long, rounded at the apex;		
glumes with conspicuous white margins; bracts reaching 16 in, long; stamens		
usually 3	7.	C. albomarginatus.
Nut 11, in. long, obcordate at the apex;	•	
margins of glumes not conspicuously		
white; bracts reaching 9 or 10 in. long;	0	()
		C. puncticulatus. C. odoratus.
Fruit a dorsally compressed nut.	٠.	O. vaorana.
Spikelets many, densely packed in a terminal head;		
stems reaching 10 in, long; bracts 1-6 in, long; a	_	
	U.	С. рудтæиг.
Spikelets 1-30 in 1 apparently lateral head; stems reaching 2 ft. long; bracts 1-3 in, long	١.	C. Lavinatus.
Spikes umbellate; stems reaching 3 ft. long; bracts		-;
reaching 18 in. long; a stout perennial herb 1	2.	C, alopecuroides.

```
Stigmas 3; fruit a trigonous or triquetrous nut.
  Rhachilla of spikelets persistent.
    Inflorescence usually umbellate, rarely capitate.
      Spikelets digitate or clustered, not spicate or racemose.
        Annuals (except C. Haspan).
          Glumes mucronate.
            Nut yo in. long.
              Nut oblong, pale brown or yellow; style
                shorter than the nut; stamens 1-2; margins
                of glumes byaline ....... 13. C. castaneus.
              Nut oboyoid, dark-brown; style longer than
                the nut; stamens 3; margins of glumes
                hyaline ...... 14. C. Teneriffe.
            Nut 30 in. long, obovoid, dark-brown; style
              shorter than the nut; stamens 1-2; margins
              Glumes not mucronate.
            Nut white when ripe, po in. long, globosely
              obovoid; stamen 1 (rarely 2); whole plant
              yellowish ...... 16. C. flavidus.
            Nut brown.
              Nut nearly as long as the obovate-oblong
                glume; stamen I (rarely 2) .................................. 17. C. difformis.
              Nut & the length of the glume; glumes with
                crisped incurved tips; stamens 1-2 ..... 18. C. pulcherrimus.
              Nut 1 the length of the glume; stamens 2-
                3; flowering in the first season but often
                Perennials with a woody rootstock; stamens
          usually 3.
            Inflorescence of 1 head (sometimes umbellate
              in C. conglomeratus and C. Atkinsoni).
                Rhizome very short; rootlets wiry.
                  Stems slender, close-set, nodose at the
                      Stems closely 1-seriate; spikelets
                        3-12 in a lax head; stamens 3;
                  stamen I; glumes 12 in. long ...... 21. C. leucocephalus.
                Rhizome creeping; rootlets thick.
                  Rootlets not woolly.
                    Stem solitary, distant on a much-
                      divided, elongate, creeping rhizome. 22. C. arenarius.
                    Stems exspitose, on a short rhizome
                      (inflorescence sometimes umbellate) 23. C. Atkinsoni.
                  Rootlets woolly (inflorescence sometimes
                    umbellate) ...... 24. C. conglomeratus
      Spikelets spicately, rarely subracemosely disposed:
        stamons usually 3.
          Rhachilla of spikelets not or scarcely winged.
            Annuals with tufted stems.
              Stems 4-16 in. long; spikelets 1-11 in. long;
                nut about 1 as long as the glume ...... 25. C. compressus.
              Stems 3-6 in. long; spikelets 1-1 in. long;
                nut less than \(\frac{1}{2}\) the length of the glume ... 26. C. aristatus.
              Stems 14-20 in. long; nut nearly as long as
                the glume ...... 27. C. Iria.
            Perennials with woody rhizome and often long
              stolons.
                Spikelets compressed; rootstock with
                  elongate stolons; bracts divaricate ..... 28. C. procerus.
```

Spikelets spicate.
Leaves more than I ft. long.
Glumes remote; nut nearly as long
as the glune 29. C. nutans.
Glumes not remote; nut f as long as the glume; bracts perer divaricate;
no frue stolons
no true stolons
Rhachilla of spikelets distinctly winged.
Leaves short, rarely \(\frac{1}{2} \) as long as the stem.
Glumes approximate; stolone long, stout.
Spikelets pale straw-colored; bracts very
short, rarely half as long as the umbel-
rays; stem not articulate when dry 32. C. tegetiformis.
Spikelets rusty-brown; bracts more than
half as long as the umbel-rays; stem more or less articulate when dry
Glumes remote, in fruit scarcely imbricating;
stolons 0
Leaves long, more than half as long as the
stem or longer.
Rhizome stoloniferous.
Leaves arising from the stem at some
distance above the base and below its
middle; stems 4-12 in. long 35. C. bulbosus.
Stolons 4-8 in. long, bearing hard
black fragrant tubers; stems 4-
30 in, long
Stolons not or rarely lubersterous;
stems 2-4 ft. long 37. C. tuberosus.
Illizone not stoioniterous.
Spikelets much compressed, ascending;
wings persistent
Spikelets terete, spreading horizontally; wings deciduous
Rhachilla of spikelets disarticulating above the
2 lowest glumes.
Stems less than 1 ft. long; spikelets bearing
1 nut 40. C. Clarkei.
Stems much more than I ft. long.
Spikelets distant along the rhachis, bearing
1-2 nuts; margins of glumes not hyaline;
nut oblong, not curved, ‡ in. long, pale- brown; style more than ‡ as long as the
nut; rhizome not stolouiferous 41. C. konkanensis.
Spikelets closely packed along the rhachis,
Spikelets bearing 1 nut; margins of
glumes hydine; nut f in. long, oblong,
curved, pale-brown; style not 1 the length of the nut; rhizome stolo-
length of the nut; rhizome stolo-
niferous 42. C. paniceus var.
Spikelets bearing 3-6 nuts; nut t'z in. [Roxburghiana.
long, ellipsoid, not curved, black;
margins of glumes hyaline; style more than 1 as long as the nut;
rhizome stoloniserous
Spikelets bearing 4-14 nuts; margins
of glumes not hyaline; rhachilla
with oblong persistent wings 44. C. dilutus.

1. Cyperus latespicatus, Bacck. in Flora, v. 42, p. 433 (of no. 28, July 1859, Not of no. 27). Usually annual; rhizome not creeping;

stems 4-12 in. high, erect, slender, stiff, obscurely angled, striate. Leaves shorter than the stem, linear, rather rigid, very acute, $\frac{1}{10} - \frac{1}{6}$ in. broad. Umbel simple, sometimes reduced to one head; bracts 3, unequal, the longest sometimes reaching 4 in. long, similar to the leaves. Spikelets straw-colored, shaded with chestnut-brown, oblong-lanceolate, compressed, $\frac{1}{6} - \frac{1}{6}$ in. long, 20-60-flowered. Glumes $\frac{1}{6}$ in. long, boat-shaped, when opened out broadly ovate, acute, $\frac{1}{10}$ in. broad, leaving a scar on the rhachilla after falling. Nuts obvoid, black, $\frac{1}{20}$ in. long, very shortly apiculate, slightly compressed, microscopically longitudinally striatulate and irregularly subreticulate; style $\frac{1}{30} - \frac{1}{20}$ in. long; stigmas 2, filiform, longer than the style. Boeck, in Linnea, v. 35 (1868) p. 467; Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 40. Pycreus latespicatus, C. B. Clarke, in Hook, f. Fl. B. I. v. 6 (1893) p. 590; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430; Prain, Beng. Pl. p. 1136.—Flowers: Sept.

NONRAN: Stocks!, Law! Deccan: Mawal (Poona districts), Woodrow!-Distrib. More or less throughout India.

2. Cyperus malabaricus, C. B. Clarke, in Journ. Linn. Soc. v. 34 (1898) p. 12 (Pycreus). Root fibrous; stems caspitose, slender, I ft. high. Leaves about $\frac{2}{3}$ as long as the stem, $\frac{1}{12}$ in. broad, weak. Inflorescence about 1 in. long and broad, composed of 6-12 spikelets arranged upon 2-3 sessile branchlets; involucial bracts 3, similar to the leaves, the longest reaching $\frac{3}{2}$ in. long. Spikelets 20-flowered, distant, $\frac{1}{4}$ by $\frac{1}{3}$ in., lmear-oblong, subacute, the sides exactly parallel. Glumes $\frac{1}{10}$ in. long, boat-shaped, dark brown with narrow white margins, when opened out broadly ovate, acute, and $\frac{1}{10}$ in. wide. Nut globosely ovoid, slightly compressed, very shortly apiculate, brown, microscopically longitudinally striatulate and faintly transversely ribbed; style $\frac{1}{10}$ in. long; stigmas 2, rather shorter than the style, filiform. Pycreus malabaricus, C. B. Clarke (l. c.), Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430.

Diccan: Lanch, Woodrow', Khandala, Cooke', Woodrow!-Distain. India (W. Peninsula), apparently endemic.

3. Cyperus sanguinolentus, Vahl, Enum. v. 2 (1806) p. 351. Rhizome creeping, as thick as a crow-quill, 4-10 in, long; stems 4-20 in, long, stout, decumbent at the base, often clothed \(\frac{1}{3}\) of their length with leaf-sheaths. Leaves few, many or 0, as long as the stem or shorter, \(\frac{1}{10} - \frac{1}{6}\) in, broad, acuminate, 1-nerved; midrib often red. Umbel small, simple; bracts 3-5, up to 5 in, long, foliaceous. Spikelets 3-6 (sometimes contracted into a single head), \(\frac{1}{4} - \frac{3}{6}\) by \(\frac{1}{6}\) in, flat, linear or oblong, 6-24-flowered, reddish-brown. Glumes \(\frac{1}{10}\) by \(\frac{1}{10}\) in, boat-shaped, broadly ovate, obtuse, nearly as broad as long, greenish-yellow and with 3 green nerves at the back, the sides reddish-brown. Anthers linear, muticous. Nut-\(\frac{1}{20}\) in, long, suborbicular, laterally compressed, shortly apiculate, biconvex, brown; style \(\frac{1}{20} - \frac{1}{10}\) in long; stigmas 2, capillary, about as long as the style. Nees, in Wight, Contrib. (1834) p. 75; Trim. Fl. Ceyl. v. 5, p. 20. Pycreus sanguinolentus, Nees, in Linnæa, v. 9 (1835) p. 283; C. B. Clarke, in Hook, f. Fl. B. I. v. 6, p. 590; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 430; Prain, Beng. Pl. p. 1136.

KONKIN: Law!; Kalyan, Woodrow, 11! Discas: Khandala, Woodrow, Sing: Pinwill!-Distain, Throughout India; Ceylon, warm parts of the Old World.

4. Cyperus hyalinus, Vahl, Laum. v. 2 (1806) p. 329. Annual; stems tulted, 2-8 m. long. Leaves as long as the stem or longer, ! in. broad, narrowly linear, acuminate, flat, flaced, 1-nerved. Umbels simple, with 3-7 rays reaching 2 m. long or sometimes reduced to clusters of sessile few-flowered spikelets; bracts 3-1, leaf-like, reaching 6 m. long, the largest reaching ½ m. broad. Spikelets ½-½ by ½-½ m., yellowish-green, 6-10-flowered, oblong, much compressed; rhachilla stout, winged. Glumes ½ by ½-y m., narrowly ovate-oblong, boatshaped; keel herbaceous, brown, 3-nerved, produced into a long slightly recurved cuspidate point beyond the rounded tip; the sides hyaline, each with 2 strong nerves. Stamens 2-3. Nut ½- by ½-y m, somewhat obliquely oblong-obovate, laterally flattened, truncate or slightly reture at the apex, brown; style ½-y m. long; stigmas 2, longer than the style, capillary. Boeck in Linnea, v. 35 (1868) p. 482; Trim. I'l. Ceyl. v. 5, p. 19. Cyperus primilus, Nees, in Wight, Contrib. (1834) p. 74 (not of Lunn.). Pycreus pumilus, Nees, in Linnea, v. 9 (1835) p. 283; C. B. Clarke, in Hook, f. I'l. B. I. v. 6, p. 591.—I'lowers Sept.

Raro Bombay Presidency without locality, Dr Icith, 25' Konkin Sion (Bombay), Woodrow -- Distrik India (W. Pennsula), Ceylon, Timor.

5. Cyperus pumilus, Lann. Sp. Pl. ed. 2 (1762) p. 69. Annual: stems tutted, 1-12 m. long, slender. Leaves shorter or longer than the stems, -1, 1 in. broad, linear, 1-nerved, acute. Heads of spikelets 1-1 in, diam., sometimes broken up into pedunculate spikes or clusters of spikelets, sometimes umbellate, the rays of the umbel 1-6, occasionally though rarely reaching 3 in. long, usually much less; bracts 3-4, leaflike, up to 42 in. long. Spikelets 1-8 by 10-8 in., 20-50-flowered, much compressed; thachilla stout, not winged. Glumes 10 in. long by about 1 in. broad in the widest place, ovate, boat-shaped, 2-fid at the tip with a narrow herbaceous keel which is cuspidately produced at the apex, with 3-5 conspicuous brown nerves and with rounded hyaline nerveless sides. Stamen usually 1. Aut ellipsoid-oblong or subobovoid, scarcely $\frac{1}{10}$ in, long, very minutely apiculate, beconvex, laterally compressed, blown: style about equalling the nut, very slender; stigmas 2, capillary, about equalling the style. Trim. I'l. Ceyl. v. 5, p. 19; Clarke, m Journ. Lunn. Soc. v. 21 (1881) p. 13. Cyperus nitens, Vahl, Enum. v. 2 (1806) p. 331. Pycieus nitens, Nees, in Nov. Act. Acad. Cin. v. 19, Suppl. (1843) p. 53, C. B. Clarke, in Hook. f. Fl. B. I. v. 6, p. 591; Woodr, in Jouin. Bomb. Nat. v. 13 (1901) p. 430; Pram, Beng. Pl. p. 1136 .- I'lowers Sept.

6. Cyperus globosus, All. Auct. Fl. Pedem. (1789) p. 49. A glabrous very variable annual, root fibrous; stems tufted, 4-25 in. long, very slender, trigonous. Leaves shorter than the heads, very slender, almost filiform. Umbel simple, with 3-5 rays 1-2 in. long, very slender, terminated by solitary or few spikes of 5 or more spreading spikelets, or the spikes capitate; bracts 2-3, leaf-like, the longest sometimes reaching 3 in. long, narrow, almost filiform. Spikelets crowded, $\frac{3}{8}$ - $\frac{3}{4}$ by $\frac{1}{10}$ - $\frac{1}{8}$ in., linear with parallel sides, much compressed.

20-50-flowered, brown or sometimes almost black; rhuchilla stout, tetragonous, not winged, often spotted with red. Glumes \(\frac{1}{10} \) by \(\frac{1}{25} \) in: long, closely imbricate, ovate-oblong, obtuse; keel greenish-yellow with brownish-red veins; the sides brown with hyaline margins. Stamens 2. Nuts \(\frac{1}{30} \) in. long, broadly or narrowly obovoid, rounded and apiculate at the apex, laterally compressed, biconvex, dark chestnut-brown, slightly papillose; style about \(\frac{1}{30} \) in. long; stigmas 2, as long as the style, capillary. Trim. Fl. Ceyl. v. 5, p. 21. Cyperus ater, Dalz. & Gibs. Bo. Fl. (1861) p. 283 (not of Vahl). C. capillaris, Kæn. ex Roxb. Fl. Ind. v. 1 (1832) p. 194; Dalz. & Gibs. p. 283. Konkan: Stocks!, Law! Dr.ccan: Dalzell & Gibson; Mahableshwar, Woodrow; Poona, Jacquemont, 403!, Cooke!; Soos, 8 miles north-west of Poona, Bhita!; Hura, Dalzell ex C. B. Clarke.—Distrin. Throughout India; Coylon, temperate and tropical

regions of the Old World.

Mr. Clarke describes a variety of this which he has called var. nalagirica and founds it on the width of the spikelets, which are, he says, narrower than in the type. I cannot find that the character is at all a reliable one, and I have carefully examined many specimens, both Indian and European. The color of the spikelets in Peninsular specimens is usually darker than that of the Humalayan and European ones, but Mr. Clarke has very distinctly stated in Dyer's 'Flora of Tropical Africa,' v. 8, p. 300, that be has founded the variety not on the color, which he considers accidental, but on the width of the spikelets.

7. Cyperus albomarginatus. Mart. & Schrad. ex Nees, Fl. Bras. v. 2, part 1 (1842) p. 9. A glabrous annual; stem solitary, erect, 1-3ft. high, triquetrous above. Leaves shorter than the stem, 1 in. broad. Umbel with 4-12 rays reaching sometimes 7 in. long; secondary umbels with 1-7 rays up to 11 in. long; bracts large, the longest sometimes reaching 16 by 4-3 in., linear, acuminate, striate, leaf-like; bracteoles of secondary umbels up to 13 in. long, very slender, almost filiform. Spikes $1\frac{1}{4}-2\frac{1}{2}$ in. long. Spikelets 8-20, distant, spreading, acute, $\frac{1}{2}-\frac{3}{4}$ by $\frac{1}{10-8}$ in., pale brown; rhachilla stout, slightly winged. Glumes $\frac{1}{6}$ by 15 in., elliptic-oblong, rounded and hyaline at the apex, scarcely keeled, compressed, the back 5-7-nerved, the sides yellow or brown with conspicuous white margins chiefly near the apex. Stamens usually 3; anthers linear-oblong. Nut 10 in. long, obovoid, apiculate, rounded at the apex, laterally compressed, granulate, black. Cyperus Hochstetteri, Nees ex Krauss, in Flora, v. 28 (1845) p. 755 in note; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 69. Pycreus albomarginatus, Nees, in Mart. Fl. Bras. v. 2, part 1 (1842) p. 9; C. B. Clarke, in Hook. f. Fl. B. I. v. 6, p. 594; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430.

KONRAN: Dalzell! S. M. Country: Londa, Cooke!—Distrib. India (W. Peninsula); Ceylon, China.

9. Cyperus odoratus, Linn. Sp. Pl. (1753) p. 46. Perennial; stems tufted, 12-30 in. long, slender, trigonous, thickened at the base, sometimes 0. Leaves shorter than the stem, To in broad; sheath short. Umbel simple, of 2-7 slender rays 1-2 in. long, each terminated by short ternate spikes of 4-8 narrow spikelets; bracts 3-6, spreading, the longest up to 6 in, long or more, leaf-like. Spikelets $\frac{1}{2}$ - $\frac{3}{2}$ by $\frac{7}{8}$ - $\frac{7}{10}$ in., linear, acuminate, flat, reddish-brown, 20-50-flowered. Glumes $\frac{1}{10} - \frac{1}{8}$ by $\frac{1}{30}$ in., closely imbricate, ovate-lanceolate, mucronulate; keel straight, obscurely 3-nerved; the sides yellow streaked with brown with hyaline margins. Stamens usually 2; authers small, oblong. Nut in long, oblong-ellipsoid, rounded at the apex, apiculate, laterally compressed, biconvex, faintly granulate, brown; style in. long; stigmas 2, filiform, as long as the style. Cyperus polystachyos, Rottb. Descrip. et Icon. (1773) p. 39, t. 11, fig. 1; Grah. Cat. p. 231; Dalz. & Gibs. p. 281; Trim. Fl. Ceyl. v. 5, p. 20. Pycreus polystachyos, Beauv. Fl. Ow. v. 2, p. 48, t. 86, fig. 2; C. B. Clarke, in Hook. f. Fl. B. I. v. 6, p. 592; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430; Prain, Beng. Pl. p. 1136.

The specific name odoratus, Linn., has priority over polystachyos, Rottb.

KONKAN: Malwan, Woodrow. Gujarat: Surat, Woodrow. Sind: Pinwill:—Distrib. Throughout India near the coast; Ceylon, all warm countries especially near the sen.

10. Cyperus pygmæus, Rottb. Descrip. et Icon. (1773) p. 20, t. 14, fig. 5. An annual dwarf herb; stems 1-10 in. long, densely tufted. Leaves numerous, as long as or shorter than the stem, $\frac{1}{16}$ $\frac{1}{10}$ in. broad, flaccid, green, acuminate. Spikelets very many (often 100), sessile, densely packed in a terminal head $\frac{1}{4}$ $\frac{2}{3}$ in. in diam., ovate, $\frac{1}{5}$ by $\frac{1}{10}$ in., compressed, 8-20-flowered, green or pale brown; bracts 2-6, dilated at the base, 1-6 in. long, acuminate, leaf-like; rhachilla slender, not winged, often curved or twisted. Glumes closely imbricate, $\frac{1}{10}$ $\frac{1}{5}$ by $\frac{1}{30}$ in., oblong-lanceolate cuspidate, the back streaked with brown, the sides with broadly hyaline margins. Stamen 1 (rarely 2); anthers linear-oblong, muticous. Nut $\frac{1}{25}$ in. long, ellipsoid, plano-convex or trigonous, orange-brown; style $\frac{1}{30}$ in. long; stigmas 2, capillary, about as long as the style. Boeck, in Linnæa, v. 35 (1868) p. 493; C. B.

Clarke, in Journ. Linn. Soc. v. 21, p. 81; Trim. Fl. Ceyl. v. 5, p. 18. Cyperus squarrosus, Roxb. Hort. Beng. (1814) p. 81 (not of Linn.); Grah. Cat. p. 231. Juncellus pygmaus, C. B. Clarke, in Hook. f. Fl. B. I. v. 6 (1893) p. 596; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430; Prain, Beng. Pl. p. 1138.—Flowers: Oct.

Konkan: Law! Diccan: Poona, Woodrow. Gujarat: Surat, Woodrow.—Disenie, More or less throughout India; Ceylon, Malaya, N. Trop. Africa, China, Japan, Australia, Europe (Mediterranean regions).

11. Cyperus lævigatus, Linn. Mantiss. (1771) p. 179. Glabrous; rhizome creeping horizontally, I in. in diam., long and with solitary distant stems, or short and with crowded stems, their bases enclosed by imbricate shining chestnut-red scales; stems 4-24 in. long, round, somewhat fleshy. Leaves usually short or scarcely any, sometimes as long as the stem, $\frac{1}{10-R}$ in. broad, the upper part often terete. Spikelets 1-30 in one apparently lateral head, solitary or clustered, straw-colored: bracts 2, the lower as though a continuation of the stem 1-3 in, long, the other much shorter or wanting. Spikelets 1-1 by 1 in., ovate. subacute, compressed but thick, straw-colored dotted with brown spots, 12-30-flowered; rhachilla stout, quadrangular, dotted with brown Glumes $\frac{1}{10} \frac{1}{8}$ by $\frac{1}{20} \frac{1}{16}$ in., ovate or oblong, acute, mucronulate. closely imbricate, dotted with brown spots, the sides with hyaline margins. Stamens 3; filaments ligulate, membranous; anthers linear, In long, yellow with a reddish-brown acute tip. Nut 10 in long, obovoid, plano-convex; style about as long as the nut; stigmas 2, short. Boeck, in Linna, v. 35 (1868) p. 486; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 77. Juncellus levigatus, C. B. Clarke, in Hook, f. Fl. B. I. v. 6 (1893) p. 596; Woodr, in Journ. Bomb. Sind · Stocks, 751!

12. Cyperus alopecuroides, Rottb. Descrip. et Icon. (1773) p. 38, t. 8, fig. 2. A large glabrous perennial herb; root fibrous; stems 2-3 ft. high, stout, often 1 in. or more in diam. at the base, trigonous above, the angles smooth. Leaves many, as long as the stem or shorter, 1-1 in. broad, coriaceous, acute. Umbel large, compound, with 4-6 primary rays up to 4 in. long, slender; secondary rays up to 1 in. long bearing clusters of oblong, sessile and pedunculate spikes \(\frac{2}{3}-\frac{1}{4}\) by \(\frac{1}{3}-\frac{1}{4}\) in, denselv covered with small spikelets: rhachis of spike stout; bracts reaching 18 in. long by \(\frac{1}{2}\) in. broad at the base, leaf-like; bractcoles 3-4, linear, acute, slender, sometimes wanting. Spikelets \(\frac{1}{4}-\frac{1}{4}\) by \(\frac{1}{10}\) in., elliptic-lanceolate or ovate-oblong, subacute, compressed, straw-colored; rhachilla stout, subtetragonous, not winged. Stamens 3;

anthers long, linear, muticous. Glumes $\frac{1}{10}$ by $\frac{1}{30}$ in., not keeled, obscurely nerved, ovate-oblong, mucronulate, with broad hyalino margins, the sides and back streaked with brown. Nut $\frac{1}{10}$ m. long, ellipsoid, plano-convex or biconvex, sometimes subtrigonous, pale yellow when young, ashy-brown in age. Grab. Cat. p. 232; Dalz. & Gibs. p. 252; Trim. Fl. Ceyl. v. 5, p. 38; Boeck. in Linnaa, v. 36 (1870) p. 321; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 74. Juncellus alopecwoides, C. B. Clarke, in Hook. f. Fl. B. I. v. 6 (1893) p. 595; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430.

13. Cyperus castaneus, Willd, Sp. Pl. v. 1 (1797) p. 278. A low herb 1-7 in. high; stems few or many, tufted, slender. Leaves as long as or shorter than the stem, $\frac{1}{1}$, $\frac{1}{1}$ in broad; sheaths often purple. Umbel usually simple, consisting of a central sessile head and few or many unequal spreading rays 1-11 in, long (rarely again divided, sometimes reduced to a terminal head); rays terminated by heads of 3-20 stellately spreading spikelets; bracts 3-5, the longest sometimes reaching 6 in. long, narrowly linear, leaf-like, diluted at the base, cuspidate at the apex, spreading. Spikelets 1-1 by 10 10 in. long, oblong or linear, compressed, usually dark chestnut-brown, many-flowered. Glumes 16-12 in. long (excluding the mucro) by 16 in. broad; keel greenish-yellow, produced beyond the rounded tip into a long recurred mucro; sides usually chestnut-brown, the margins not hyaline; rhachilla rather stout, scarcely winged. Stamens 1-2; anthers small. Nut 10 in. long, oblong, trigonous, shortly apiculate, narrowed at the base, pale brown or yellow, granulate; style shorter than the nut; stigmas 3, filiform. Fl. B. I. v. 6, p. 598; Boeck in Linnea, v. 35 (1868) p. 496; Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 87; Trim. Fl. Ceyl. v. 5, p. 25; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430.-Flowers: Oct.-Dec.

Rare. Konkan: Cookel; Bombay, Woodrow. Laddapur, Ekita'-Distrin. India (Nepal, Sikkim, Pegu, W. Penmsula), Ceylon, Tonkin, Central Australia.

14. Cyperus Teneriffæ, Poir. Encyc. Method. v. 7 (1806) p. 245. A low glabrous annual of a reddish-brown color; root fibrous; stems 2-8 in. long, tufted. Leaves usually shorter than the stem, in horod, linear, acute; sheaths reddish, inflated. Head solitary, of 3-20 sessile spikelets; bracts 2, the longest \(\frac{3}{4}-\frac{1}{2}\) in. long, narrowly linear, acute. leaf-like. Spikelets \(\frac{1}{3}-\frac{1}{6}\) by \(\frac{1}{2}-\frac{1}{4}\) in., much compressed, reddish-brown. Glumes \(\frac{1}{6}\) in. long (including the nucro) by \(\frac{1}{16}\) in. broad, boat-shaped, keeled; keel produced into a conspicuous recurved nucro; sides with 4-5 conspicuous ribs on each, the margins hyaline. Stamens 3; anthers oblong, muticous. Nut \(\frac{1}{20}\) in. long, obovoid, obtuse, shortly apiculate, triquetrous, dark brown; style longer than the nut; stigmas 3, shorter than the style. I have not found any of the nuts reticulate black and white as stated in the 'Flora of British India.' Fl. B. I. v. 6, p. 601; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430. Cuperus Wightii, Nees, in Wight, Contrib. (1834) p. 78; Boeck. in Linnæa, v. 35

(1868) p. 507. C. rubicundus, Kunth, Enum. v. 2 (1837) p. 49 (not of Vahl); Boeck. in Linuma, v. 35 (1868) p. 507; C. B. Clarke, in Journ. Linn. Soc. v. 21, p. 104.—Flowers: Sept.

Rare. Deccan: Poona, Woodrow, 143!—Distrin. India (W. Peninsula); Teneriffe, Africa.

15. Cyperus uncinatus, Poir. Encyc. Méthod. v. 7 (1806) p. 247. A glabrous annual; stems 3-6 in. long, tufted, slender. Leaves as long as or shorter than the stem, filiform, flexuous. Umbel simple, consisting of a central sessile head and few or many filiform spreading unequal rays 1-1 in. long, each terminated by a head of stellately spreading spikelets; bracts 3-5, filiform, much longer than the rays, the longest sometimes reaching 3 in. long. Spikelets 1-1 by 1 in., 5-12 in a cluster, compressed, 12-24-flowered, reddish-brown; rhachilla scarcely winged, slender. Glumes in long (not including the mucro, which is nearly as long as the limb), oblong, obtuse, about 10 in. broad; keel 3-nerved, produced into a long recurved mucro; sides usually brown, hyaline. Stamens 1-2; anthers short, oblong. Nut about 1 in. long. obovoid, trigonous, shortly apiculate, dark brown, faintly granulate; style shorter than the nut, very slender; stigmas 3, capillary, about equalling the style. Distinguished from C. castaneus, which it much resembles, by the nuts which are obovoid, those of C. castaneus being oblong and longer. C. B. Clarke, in Dyer's Fl. Trop. Africa, v. 8 (1902) p. 328. Opperus cuspidatus, H. B. & K. Nov. Gen. & Sp. v. 1 (1815) p. 204: Boeck. in Linnwa, v. 35 (1868) p. 496; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 88 & in Hook. f. Fl. B. I. v. 6, p. 598; Trim. Fl. Ceyl. v. 5, p. 26; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 430; Prain, Beng. Pl. p. 1139.

Decean: Lanoli, Woodrow. Sind: Pinwill!—Distain. Throughout India; Ceylon, Tropical Africa, Java, China, Australia, America.

16. Cyperus flavidus, Retz. Obs. fasc. 5 (1789) p. 13. Annual; root fibrous, dark purple (Dalz. & Gibs.); stems tufted, 6-8 in. high, weak, obtusely trigonous. Leaves shorter or longer than the stem, 16-15 in. broad, linear, acute. Umbel compound or decompound, when mature yellow or finally blackening; rays many, the primary 1-2 in. long, the secondary 1-1 in. long, bearing heads of stellately spreading minute spikelets; bracts 2-3, the longest reaching 6 in. long; bracteoles 0. Spikelets $\frac{1}{8} - \frac{1}{4}$ by $\frac{1}{16}$ in., linear-lanceolate. Glumes $\frac{1}{25}$ in. long, oblong, rounded (not mucronate) at the tip, with a green obscurely. 3-nerved back, the sides with hyaline margins. Stamen 1 (rarely 2); anthers linear, muticous. Nut 30 in. long, globosely obovoid, trigonous, rounded, shortly and stoutly stipitate, at first pale-yellow, becoming white when quite ripe. Dalzell & Gibson (Bo. Fl. p. 285) say that the plant is easily recognized by its yellow hue. Fl. B. 1. v. 6, p. 600; Dalz. & Gibs. p. 284; C. B. Clarke, in Journ. Linn. Soc. v. 21, p. 122; Trim. Fl. Ceyl. v. 5, p. 27; Prain, Beng. Pl. p. 1139. Oyperus Haspan var. a indicus, Boeck. in Linnaa, v. 35 (1868) p. 574.

Decean: Dalzell & Gibson.—Distain. More or less throughout India in rice-fields; Ceylon, warm regions of the Old World.

17. Cyperus difformis, Linn. Cent. Pl. part 2 (1755), in Aman. Acad. v. 4 (1788) p. 302. A glabrons annual; root fibrous; stems 4-

20 in. long, tufted, weak, triquetrous towards the top. Leaves few, usually shorter than the stem, $\frac{1}{3} - \frac{1}{6}$ in. broad, linear, acuminate, obscurely nerved, flaccid. Spikes in a simple or compound umbel or contracted into a head; rays of the umbel 3-6, slender, up to $1\frac{1}{2}$ in. long; bracts 2-4, the lowest 2-10 in. long, leaf-like. Spikelets many, in dense heads, dusky or brown, $\frac{1}{3} - \frac{1}{2}$ by $\frac{1}{3}$ in., oblong, obtuse, 10-30-flowered; rhachilla slender, not winged. Glumes $\frac{1}{3} - \frac{1}{3}$ in. long, closely imbricate, obovate-oblong, obtuse, concave, 3-nerved and rounded on the back; sides broadly hyaline. Stamen 1 (less commonly 2); anthers small, oblong, muticous, yellow. Nut $\frac{1}{3}$ in. long, ellipsoid, obtusely trigonous, rounded and apiculate at the apex, smooth, yellow or brown; style much shorter than the nut; stigmas 3, linear, short. Fl. B. I. v. 6, p. 598; Grah. Cat. p. 232; Dalz. & Gibs. p. 282; Boeck, in Linnæa, v. 35 (1868) p. 586; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 133; Trim. Fl. Ceyle v. 5, p. 25; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430; Prain, Beng. Pl. p. 1139.—Flowers: Oct.—Jan.

Konkan: Matheran, Woodrow. Deccan: Chinchwad, near Poona, Woodrow; Khandala, Woodrow; between Ellora and Poona, Jacquemont, 275!—Distrib. More or less throughout India; Ceylon, the Old World generally in warm regions.

18. Cyperus pulcherrimus, Willd. in Kunth, Enum. v. 2 (1837) p. 35. Rhizome short, creeping; root-fibres slender; stems 12-18 in. long, slender, trigonous. Leaves as long as the stem or longer, narrowly linear, $\frac{1}{12} - \frac{1}{8}$ in. broad, weak, 1-nerved. Umbel compound. contracted; rays very many, reaching 12 in. long, bearing crowded umbellules whose subglobose heads of innumerable spikelets conceal the secondary rays which are $\frac{1}{4}$ in. long; bracts 3-6, leaf-like, the longest reaching 6 in. long. Spikelets 8-12, small, not reaching 1 in. long, about 15 in. broad, densely crowded, oblong-lanceolate, 12-30flowered; rhachilla not winged, slender. Glumes ovate-oblong, obtuse, with crisped incurved tips, the sides hyaline with 2 broad reddish-brown bands. Stamens 1-2; anthers linear. Nut minute, half as long as the glume, shortly and stoutly stipitate, globosely trigonous, acute at both ends, granulate; style nearly as long as the nut; stigmas 3, capillary. Fl. B. I. v. 6, p. 600; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 132; Boeck. in Linnea, v. 35 (1868) p. 573; Trim. Fl. Ceyl. v. 5, p. 27.

Sind: Pinwill!-Distrib. India (Assam); Ceylon, Penang, Java, Borneo.

19. Cyperus Haspan, Linn. Sp. Pl. (1753) p. 45. Perennial, glabrous; rhizome creeping, clothed with ovate triangular scales, giving off solitary or tufted stout or slender trigonous or triquetrous often compressed stems 4-24 in. long. Leaves usually shorter (sometimes longer) than the stem, \(\frac{1}{5}-\frac{1}{5}\) in. broad, acute, erect (occasionally very short and subulate); sheaths inflated. Umbel simple or compound, of 4-12 very unequal rays up to 3 in. long; secondary rays bearing 3-8 slender stellately spreading spikelets; bracts 2-3, variable, narrow and shorter than the rays, or broader than the leaves and 3 in. long. Spikelets \(\frac{1}{6}-\frac{1}{3}\) by \(\frac{1}{15}-\frac{1}{3}\) in., linear, acute, flat, 10-40-flowered, pale or chestnut-brown; rhachilla narrow, scarcely winged. Glumes \(\frac{1}{16}\) by \(\frac{1}

anthers linear-oblong. Nuts $\frac{1}{40}$ in, long, globosely obovoid, rounded and shortly apiculate at the apex, trigonous, on a short thick stipes, yellow or pale-brown; style longer than the nut; stigmas 3, capillary. Fl. B. I. v. 6, p. 600; Grah. Cat. p. 231; Dalz. & Gibs. p. 282; Boeck. in Linna, v. 35 (1868) p. 574; Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 119; Trim. Fl. Ceyl. v. 5, p. 26; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430; Prain, Beng. Pl. p. 1139; Watt, Dict. Econ. Prod. v. 2, p. 684.—Flowers: Oct.—Dec.

Konkan, Rainagur, Woodrow, Drecan: Icanoli, Woodrow — Distrib. Throughout India, common in rice-fields; Ceylon, Malaya, Indo-China, Tropical Africa and Australia.

20. Cyperus niveus, Retz. Obs. fasc. 5 (1789) p. 12. Glabrous, glancescent; rhizome woody, short, the rootlets wiry; stems 8-16 in. long, nodose at the base, closely 1-scriate. Leaves much shorter than the stem, narrowly linear, setaceo-acuminate, 1-1 in. broad, weak. Spikelets 3-12 in one head, reaching \(\frac{3}{4}\) by \(\frac{1}{4}\) in., oblong-elliptic, compressed, pale, sometimes almost white, 20-40-flowered; rhachilla not winged; bracts usually 2, the longest reaching 21 in. long, finely acuminate, not dilated at the base, leaf-like. Glumes 1 by 15 in., ovatelanceolate, compressed; keel produced into a very short mucro; sides whitish or whitish-brown, multistriate, with narrow hyaline margins. Stamens 3; filaments long, persistent; anthers linear, muticous, exserted from the glume. Nut 1 in. long, obovoid, triquetrous, dark brown; style 1 in. long; stigmas 3, rather shorter than the style. Fl. B. 1. v. 6, p. 601; Boeck. in Linnea, v. 35 (1868) p. 530; C. B. Clarke, in Journ. Linn. Soc. v. 21, p. 108; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430: Prain, Beng. Pl. p. 1139; Watt, Dict. Econ. Prod. v. 2, p. 686.—Flowers: Nov.

Sind · Pinvill , Hyderabad, Woodrow.—Distair. More or less throughout India; Afghanistan, China.

21. Cyperus leucocephalus, Retz. Obs. fasc. 5 (1789) p. 11. A glabrous herb; rhizome very short, woody, with long fibrous rootlets; stems caspitose, very slender, nodose at the base, each carrying one head. Leaves shorter than the stem, narrow, $\frac{1}{20}$ in. broad, manynerved. Heads dense, globose, white, $\frac{1}{4}$ in in diam., containing 8-50 spikelets; bracts 3 (rarely 4), the longest reaching 2! in. long, narrowly linear, long-acuminate, many-nerved. Spikelets $\frac{1}{10}$ by $\frac{1}{10}$ in., compressed, elliptic, 10-18-flowered. Glumes $\frac{1}{10}$ by $\frac{1}{10}$ in., oblong-lanceolate, subobtuse, whitish or pale-brown, with hyadine margins. Stamen 1; anthers oblong, muticous. Nut $\frac{1}{30}$ in. long, oblong-ellipsoid, trigonous, shortly apiculate, granulate, black: style $\frac{1}{10}$ in. long; stigmas 3, as long as the style. Fl. B. I. v. 6, p. 602; Boeck. in Linnaa, v. 35 (1868) p. 590; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 407; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430.

KONKAN: N. & S. Konkan, Law!-DISTRIB. Tropics generally.

22. Cyperus arenarius, Retz. Obs. fasc. 4 (1786) p. 9. Whole plant pale or glaucous-green; rhizome elongate, creeping, striate, rigid, dichotomously branched, clothed with lanceolate chestnut-brown sheaths; rootlets thick, glabrous; stems solitary, 4-12 in. long, distant, stout, rigid, terete, attenuated at the base into the rhizome, clothed below

with long withered sheaths. Leaves longer or shorter than the stem. $\frac{1}{12} - \frac{1}{5}$ in. broad, linear, spreading and recurved, rigidly coriaccous, to rete and grooved above, or broader with complicate sides, not keeled, almost nerveless. Heads solitary on the summit of the stems, globose, 1-11 in. in diam., of many sessile radiating spikelets; bracts 2-3, leaf-like, rigid, the lowest 2-4 in, long, erect, simulating a continuation of the stem, the others much shorter. Spikelets 3-2 by 1-1 in., elliptic-lanceolate, straw-colored, becoming ultimately brown, 8-16-flowered; rhachilla stout, not winged. Glumes 1-1 by 10 in., ovate-oblong, boat-shaped, obtuse, minutely mucronate, dorsally rounded, streaked with brown, the sides with many strong nerves and hyaline margins. Stamens 3: filaments elongate, ligulate, persistent; anthers narrowly linear, muticous. exserted from the glume. Nut 10 in. long, obovoid, rounded at the spex, trigonous, black; style 16-10 in. long; stigmas 3, capillary, exserted from the glume. Fl. B. I. v. 6, p. 602; Dalz. & Gibs. p. 284; Boeck, in Linnea, v. 35 (1868) p. 536; C. B. Clarke, in Journ. Linn. Soc. v. 21, p. 106; Trim. Fl. Ceyl. v. 5, p. 23; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430.—Flowers: Oct.-Nov.

Kanara: Karwar, Talbot, 553! Gujarat: Domas near Surat on the sea-coast, Dalzell!; Abmedabad, Woodrow, 21! Sind: Pinwill!, Stocks!; Jemadar ka Landa near Karachi, Stocks!—Distrite. India (sea-coast from Sind to Ceylon and Orissa, Panjáb); Ceylon, Persia, Arabia.

23. Cyperus Atkinsoni, C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 109. Rhizome short, woody; roots not woolly; stems caspitose, 2-7 in. long, trigonous below, terete above, thickened at the base. Leaves as long as or shorter than the stem, rigid, $\frac{1}{12}$ in. broad at the base, tapering towards the finely cuspidate apex. Umbel simple, often contracted into a head; rays 3-4, reaching $\frac{2}{3}$ - $\frac{1}{3}$ in. long; bracts 2-3, the longest 2-3 in. long. Spikelets $\frac{2}{3}$ - $\frac{7}{6}$ by $\frac{1}{6}$ in., 20-30-flowered, narrowly linear, subacute; rhachilla not winged. Glumes oblonglanceolate, cymbiform, $\frac{1}{4}$ - $\frac{1}{6}$ by $\frac{1}{26}$ in., with a strong sharp slightly recurved mucro $\frac{1}{16}$ in long beyond the subacute tip; the back pale, the sides pale or cinnamon-colored, multistriate, the margins hyaline. Stamens 3; filaments $\frac{1}{4}$ in. long, ligulate, persistent; authers $\frac{1}{16}$ in. long, linear, yellow. Nut $\frac{1}{16}$ in. long, obovate, trigonous, yellow; style $\frac{1}{16}$ in. long; stigmas 3, much longer than the style, capillary. Fi. B. $\frac{1}{16}$ v. 6, p. 603; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430.

Dalzell without locality in Herb Kew.! SIND: Stocks!; Jemadar ka Landa near Karachi, Stocks!—Distrib. India (Kashmir, N.W. Himalaya, W. Peninsula).

24. Cyperus conglomeratus, Rottb. Descrip. et Icon. (1773) p. 21, t. 15, fig. 7. Glabrous, glaucous-green; rhizome short or long, woody, creeping, \(\frac{1}{\cdot \eta}\) in. in diam.; roots of stout woolly fibres; stems stout, 6-20 in. long, terete below, trigonous above, thickened at the base, clothed with brown ovate acuminate scales. Leaves as long as the stem or shorter, \(\frac{1}{10}\)—\(\frac{1}{\eta}\) in. broad, coriaceous, dorsally rounded (not keeled), shortly cuspidate at the tip, the margins involute when dry; nerves obscure. Umbel simple, often contracted into one head 1-1\(\frac{1}{\eta}\) in. diam. of densely crowded spreading spikelets; bracts 3-4, elongate, narrower than the leaves, shortly cuspidate. Spikelets \(\frac{1}{\eta}\)-1 by \(\frac{1}{\eta}\) in., oblonglanceolate, compressed, 10-24-flowered; rhachilla stout, scarred, not winged. Glumes reaching \(\frac{1}{\eta}\) by \(\frac{1}{\eta}\) in., oblong-lanceolate, cymbiform, you. II.

with a short stout mucro extending beyond the rounded tip, with many reddish-brown nerves and hyaline margins. Stamens 3; filaments $\frac{1}{10}$ in. long, ligulate; anthers yellow, $\frac{1}{8}$ in. long, narrowly linear, muticous. Nut (immature) $\frac{1}{10}$ in. long, obovoid, compressed, trigonous, yellow; style' reaching $\frac{1}{8}$ in. long, flattened; stigmas 3, capillary, much longer than the style. Fl. B. I. v. 6, p. 602; Trim. Fl. Ceyl. v. 5, p. 23; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430. Cyperus pungens, Boeck. in Linnæa, v. 35 (1868) p. 537; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 113.—Flowers: Nov.-Feb.

Gujarat: Ahmedabad, Woodrov. Sind: Pinwill!; Sibi, Lace, 3162!-Distrib. India (W. Peninsula); Ceylon, Trop. Africa, Mediterranean region.

VAR. pachyrhizus, Trimen MSS. ex Hook. f. in Trim. Fl. Ceyl. v. 5 (1900) p. 23. More slender; leaves narrower; heads 2 in. in diam.; spikelets smaller and narrower; glumes muticous. C. pachyrhizus (sp.), Nees ex Boeck. in Linnæa, v. 35 (1868) p. 545; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 111 & in Hook. f. Fl. B. I. v. 6, p. 603; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430.—Flowers; Nov.—Dec.

Konkan: Law! Gujarat: (Kuthiawar) Verawal, Woodrow!; Porbander, Woodrow!
--Distrib. India (W. Poninsula); Ceylon, Laccadive Isles.

25. Cyperus compressus, Linn. Sp. Pl. (1753) p. 46. A glabrous annual; root fibrous; stems tufted, 4-16 in. long, erect, slender, trigonous, with rounded smooth angles. Leaves shorter or longer than the stem, \(\frac{1}{16} - \frac{1}{16}\) in. broad, finely acuminate, 1-nerved. Umbel simple, often with a sessile head at the fork or occasionally altogether reduced to a sessile head; rays 3-6, reaching 3 in. long. bearing 4-8 terminal spikelets; bracts 3-5, finely acuminate, leaf-like, the longest reaching 41 in. long. Spikelets 1-11 by 1-1 in., much compressed, yellow when ripe, linear-oblong, 20-40-flowered; rhachilla stout, angular, closely scarred, scarcely winged. Glumes 1 in. long (including the mucro), oblong-lanceolate, closely imbricate; keel produced into a slightly recurved, laterally compressed mucro 10 16 in. long, beyond the obtuse tip; sides membranous, green or yellow, striate, with short hyaline margins. Stamens 3; filaments nearly 1 in. long, ligulate; anthers 1/2 in. long, yellow, linear, muticous. Nut to in. long, broadly obovoid, triquetrous, black; style 1/6 in. long; stigmas 3, as long as the style. Fl. B. I. v. 6, p. 605; Grah. Cat. p. 231; Dalz. & Gibs. p. 282; Boeck. in Linnea, v. 35 (1868) p. 517; C. B. Clarke, in Journ. Linn. Soc. v. 21, p. 97; Trim. Fl. Ceyl. v. 5, p. 33; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430; Prain, Beng. Pl. p. 1140; Watt, Dict. Econ. Prod. v. 2, p. 683.

Decean: Dalzell & Gibson; Poonn, Woodrov. Sind: Pinwill!-Distrib. Throughout India; Ceylon, Tropical Africa, Asia, and America.

26. Cyperus aristatus, Rottb. Descrip. et Icon. (1773) p. 23, t. 6, fig. 1. A small glabrous annual 3-6 in. high; roots fibrous; stems tufted, stout or slender, trigonous. Leaves usually shorter than the stem, erect, $\frac{1}{20}$ $-\frac{1}{10}$ in. broad, acuminate, flat, 1-nerved, flaccid. Umbel with 2-5 rays, or capitate with numerous spikelets crowded into a globose or oblong head $\frac{1}{4}$ in. long; bracts 2-5, the longest reaching in well-developed specimens $3\frac{1}{2}$ in. long, broader than the leaves at the

base, gradually tapering to a fine point. Spikelets $\frac{1}{3}-\frac{1}{6}$ by $\frac{1}{3}-\frac{1}{6}$ in., oblong, flat, 6-20-flowered, usually brownish; rhachilla not winged. Glumes $\frac{1}{5}$ in. long (including the mucro) by $\frac{1}{3}$ in. broad, oblong; keel strong, produced into a recurved beak as long as the limb; sides many-nerved up to near the margin, pale or brown. Stamen 1; filaments $\frac{1}{2}$ in. long; anthers small, oblong. Nut $\frac{1}{2}$ in. long, narrowly obvooid, rounded and apiculate at the apex, tapering towards the base, trigonous, reddish-brown; style $\frac{1}{3}$ in. long; stigmas 3, about as long as the style, capillary. Fl. B. İ. v. 6, p. 606; Boeck. in Linnea, v. 35 (1868) p. 500; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 91; Trim. Fl. Ceyl. v. 5, p. 24; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430; Prain, Beng. Pl. p. 1140.—Flowers: Sept.

Drecan: Poona, Jacquemont, 315!, Woodrow.—Distrib. More or less throughout India, Ceylon, Trop. Africa, Australia, America.

27. Cyperus Iria, Linn. Sp. Pl. (1753) p. 45. A glabrous annual; root fibrous; stems tufted, 14-20 in. long, triquetrous, striate. Leaves as long as the stem or shorter, $\frac{1}{6} - \frac{1}{6}$ in. broad, multistriate, finely acuminate, flaceid. Umbel decompound, of many primary rays 1-5 in. long, bearing irregularly fascicled umbellules formed of narrow interrupted spikes of 5-20 small few-flowered spikelets; bracts 3-5, the longest sometimes reaching S in. long. Spikelets 1-1 by 10-1 in., linear-oblong, obtuse, compressed, 6-20-flowered, yellow or pale brown: rhachilla not winged. Glumes 10 by 10 in., elliptic-obovate, obtuse, muticous or very minutely apiculate, loosely or scarcely imbricate, 3-5nerved, with broad hyaline margins. Stamens 2 or 3; anthers small, oblong, muticous, yellow. Nut 12 in. long, obovoid, triquetrous, brown or black; style very short, scarcely 10 in. long; stigmas 3, very short, slightly exserted from the glume. Fl. B. I. v. 6, p. 606; Grah. Cat. p. 232; Dalz. & Gibs. p. 282; Boeck. in Linnaa, v. 35 (1868) p. 595; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 137; Trim. Fl. Ceyl, v. 5, p. 18; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 430; Prain, Beng. Pl. p. 1140; Watt, Diet. Econ. Prod. v. 2, p. 685.-Flowers : Dec.

Konkan: Neral (below Matheran), Bhivr! Decean: Dalzeil of Gibson; Poona, Jacquemont, 3441; Matheran, Woodrow; Khandala, Woodrow,—Distrib. Throughout India in rice-fields; Ceylon, Indo-China, Australia, Mediterranean region.

Van. paniciformis, C. B. Clarke, in Hook. f. Fl. B. I. v. 6 (1893) p. 607. Spikelets bearing 2-4 nuts; spikes often drawn out into nearly linear racemes. Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430. Cyperus paniciformis (sp.), Franck. & Savat. Pl. Japon. v. 2 (1879) p. 103 and p. 537. C. parviflorus, Nees, in Wight, Contrib. (1834) p. 87 (exclud. all syn.).—Flowers: Sept.

Konkan: Neral (below Matheran), Cooke!, Bhiva! Drecan: Khandala, Woodrow.— Distriin, India (Kashmir, W. Peninsula, Andamans); China, Japan, Malaya, Polynesia.

28. Cyperus procerus, Rottb. Descrip. et Icon. (1773) p. 29, t. 5, fig. 3. Perennial; rootstock short, stout, stoloniferous, the stolons elongate, clothed with long acuminate scales, bulbilliferous; stems 2-3 ft. long, acutely triquetrous. Leaves very long, often exceeding the stems, [-1] in. broad, acuminate, thickly corraccous or spongy; sheaths broad, 3 r. 2

compressed, membranous. Umbel compound; primary rays 3-7, stout, 1-4 in. long; secondary rays bearing loosely corymbose spikes of 5-10 spreading compressed spikelets; rhachis of spikes rather stout, angular, glabrous; bracts 2-5, the longest reaching sometimes 15 in. long, divaricate, leaf-like. Spikelets remote, 1-1 by 1 in., linear-oblong, 10-50-flowered, straw-colored or red; rhachilla scarcely winged or winged here and there, tetragonous. Glumes 1-1 in. long, rather loosely imbricate, cinnamon-red or straw-colored, hoat-shaped; back with 5 or more nerves; sides and tip with hyaline margins. Stamens 3; anthers 10 in. long, oblong, muticous, yellow. Nut 15 in. long, broadly obovoid, trigonous, apiculate, tapering towards the base, vellow; style 10 in. long; stigmas 3, longer than the style, capillary. Fl. B. I. v. 6, p. 610; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 152; Trim. Fl. Ceyl. v. 5, p. 34; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1140. Cyperus Heynei, Boeck. in Linnaa, v. 35 (1868) p. 600.

Rarc. Konkan: Goa, Woodrow.—Distrib. More or less throughout India, chiefly near the sea; Ceylon, Tonkin, Java.

29. Cyperus nutans, Vahl, Enum. v. 2 (1806) p. 363. A tall perennial; rhizome tuberous, thicker than the thumb in old plants, are ening; root-fibres motted; stams 2-31 ft. long, stant, trigonous, with smooth angles. Leaves as long as the stem, linear, \frac{1}{4}-\frac{1}{2} in. broad, coriaceous in old plants, multistriate. Umbel very large, decompound; primary rays reaching 10 in. long, slender, trigonous, bearing numerous bracteate umbellules with secondary rays 1-2 in. long, each secondary ray terminated by many unequal simple or paniculate lax spikes 1-14 in. long, forming tassel-like clusters; rhachis slender; bracts 4-8, the longest up to 12 by $\frac{1}{2}$ in. Spikelets erect, $\frac{1}{4}$ by $\frac{1}{16}$ in., 6-10flowered, pale reddish-brown; rhachilla slender, scarcely winged, with long internodes between the glumes about if the length of the glume. Glumes 1 by 1 in., oblong, distant, erect, obtuse, shortly apiculate, rounded on the back, obscurely nerved, with narrow hyatine margins. Stamens 3; anthers linear-oblong. Nut 1 in long, narrowly obovoid or oblong, tapering towards the base, triquetrous, apiculate, yellow when ripe; style 30 in. long; stigmas 3, longer than the style, capillary. Fl. B. I. v. 6, p. 607; Bocck. in Linnan, v. 35 (1868) p. 597; C. B. Clarke, in Journ. Linn. Soc. v. 21, p. 143 (exclud. syn.); Trim. Fl. Ceyl. v. 5, p. 31; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430; Prain, Beng. Pl. p. 1140. Cyperus distans, Grah. Cat. p. 232 (not of Linn.); Dalz. & Gibs. p. 283.—Flowers: Sept.

Dalzell without locality in Herb. Kew.! Deccan: Khandala, Woodrow.—Distrib. More or less throughout India.

30. Cyperus eleusinoides, Kunth, Enum. v. 2 (1837) p. 39. Perennial; rootstock woody, with short lateral shoots but no true stolons; stems 1½-4 ft. long, stout, triquetrous, with smooth angles. Leaves usually shorter than the stem, rigid, flat, reaching ½ in. broad with a stout midrib. Umbel erect, compound, with 5-8 stout, trigonous rays 4-8 in. long; spikes sessile or pedunculate, ½-1½ by ¼-½ in. in diam., green or brown, bracteolate, ascending, never divaricate; bracts 3 or 4, the longest sometimes more than 1 ft. long and ½ in. broad, leaf-

like; bracteoles filiform or subulate. Spikelots densely imbricate, $\frac{1}{4}$ - $\frac{1}{3}$ by $\frac{1}{12}$ - $\frac{1}{5}$ in., linear-oblong, erect, flat, S-12-flowered; rhachilla slightly winged. Glumes $\frac{1}{5}$ by $\frac{1}{36}$ in., oblong, obtuse, apiculate, rounded on the back, about 5-nerved, with hyaline margins. Stamens 3; anthers small, oblong, obtuse. Nut $\frac{1}{16}$ in. long, oblong or obovoid-oblong, trigonous, apiculate, shortly stipitate, yellowish-brown; style scarcely $\frac{1}{36}$ in. long; stigmas, 3 twice as long as the style, capillary. Fl. B. I. v. 6, p. 608; Bocck. in Linnæa, v. 35 (1868) p. 596; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 142; Trim. Fl. Ceyl. v. 5, p. 37; Woodr, in Journ. Bomb, Nat. v. 13 (1901) p. 430.—Flowers: Sept.

Konkan: Lambert! Decean: Máwal (Poona districts), Woodrow. Sind: Pinwill!—Distrib. India (Kashmir, Moradabad, Darjeeling, Panjáb, W. Peniosula); Ceylon, Tropical Africa, China, Malaya, Queensland.

31. Cyperus malaccensis, Lam. Illustr. v. 1 (1791) p. 146. Glabrous, green or glaucescent; rhizome creeping, rather thick, clothed with dark brown scales. Stems 11-3 ft. long, acutely triquetrous, 1-1in. in diam., much compressed. Leaves few, the uppermost 2-6 in. long, erect, green, ensiform, shortly caudate; sheaths often enclosing the stem. Umbel 2-6 in. in diam., simple, compound or congested, with 3-12 rays 1-3 in. long, the longer corymbosely branched at the apex; bracts 2-5, divariente, subequal, spreading, flat, up to 6 by 1 in.; umbellules simple; bracteoles small. Spikes of 4-10 spikelets; rhachis glabrous. Spikelets $\frac{3}{8}$ - $\frac{5}{8}$ by $\frac{1}{16}$ - $\frac{1}{2}$ in., linear, 20-40-flowered. Glumes $\frac{1}{10}$ by $\frac{1}{10}$ in., oblong, obtuse, scarcely keeled, straw-colored or pale brown. Stamons 3; anthers linear-oblong, not crested. Nut 12 in. long, narrowly oblong, obtusely trigonous, tapering at either end, shortly apiculate; style 30 in. long; stigmas 3, longer than the style, capillary. Fl. B. I. v. 6, p. 608; Boeck. in Linnea, v. 35 (1868) p. 603; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 147; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1140; Watt, Dict. Econ. Prod. v. 2, p. 685. Cyperus Pangorii, Roxb. Hort. Beng. (1814) p. 6; Fl. Ind. v. 1 (1832) p. 202; Grah. Cat. p. 232.

Konkan: Goa, Woodrow; Kulyan, Woodrow. Sind: Pinwill!—Distrib. India (Bengal, Circars, W. Peninsula); Persia, Malyan Peninsula, Japan, China, Borneo, Australia.

32. Cyperus tegetiformis, Roxb. Hort. Beng. (1814) p. 6. Stolons thick, rather long, round, with ovate dark-colored scales; stems 1½-5 ft. long, trigonous, often triquetrous near the top. Leaves scarcely any; sheaths many, up to 6 in. long. Umbel compound or decompound; rays 10-15, up to 5 in. long, slender; secondary rays about 8, reaching 2½ in. long, terminated by spikes or corymbs of 4-16 spikelets; bracts short (rarely ½ the length of the umbel). Spikelets ½-1 in. long, 10-30-flowered, slightly compressed, pale straw-colored; rhachilla winged. Glumes ½ in. long, elliptic, obtuse or emarginate; back rounded, 5-9-nerved; sides pale, marked with yellow or red. Stamens 3; anthers muticous, reddish. Nut ½ in. long, oblong, trigonous, black; style shorter than the nut; stigmas 3, much longer than the style. Fl. B. I. v. 6, p. 612; C. B. Clarke, in Journ. Linn. Soc. v. 21, p. 157; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1140; Watt, Diet. Econ. Prod. v. 2, p. 688.

Konkan: Kalyan, Woodrow .- Distrib. India (Bengal, Assam, Bandelkand,

W. Peninsula); China, Japan.

Woodrow gives Kalyan as the habitat of the plant, but I have seen no specimens from the Bombay Presidency; there are none in Herb. Kew. It is possible that the plant collected by Woodrow may have been *C. corymbosus*, which is scarcely separable from *C. tegetiformis* and which is also reported from Kalyan.

33. Cyperus corymbosus, Rottb. Descrip. et Icon. (1773) p. 42. t. 7, fig. 4. A tall glabrous rush-like herb; rhizome creeping, clothed with dark brown scales; root-fibres stout; stems 2-3 ft. long, reaching 1 in. in diam., spongy, appearing pseudo-septate and somewhat articulate when dry, terete below, obscurely trigonous above. Leaves 0, or a short blade reaching 5 in, long terminating a long loose membranous sheath. Umbel compound, narrow; rays 6-8, erect or subcreet, very unequal, the longest reaching 4 in. long; secondary rays terminated by spikes or corymbs of 4-8 very slender spikelets; bracts 3, rarely as long as the umbel, keeled, green; bracteoles setaceous. Spikelets variable in length, 1-1 by \(\frac{1}{20}\) in., linear, subterete, rusty-brown; rhachilla slender. winged. Glumes erect, closely appressed to the rhachilla, h by an in., oblong, obtuse, rounded and 3-nerved on the back; sides pale, nerveless, scarious. Stamens 3; anthers \(\frac{1}{20} \) in. long, muticous, brownish-yellow. Nut γ_{π}^{1} in, long, narrowly obovoid, tapering towards the base, apiculate, trigonous; style 30 in. long; stigmas thrice as long or longer. Fl. B. I. v. 6, p. 612; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 158; Trim. Fl. Ceyl. v. 5, p. 29; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1141; Watt, Diet. Econ. Prod. v. 2, p. 683. Cyperus diphyllus, Retz. Obs. fasc. 5 (1789) p. 11 (not of Benth.); Boeck, in Linnan, v. 36 (1870) p. 272.

KONKAN: Kalyan, Woodrow.—Distrib. More or less throughout India; Ceylon, Tropical Africa, America. Used in S. India and Ceylon for mat-making and occasionally in Ceylon grown for that purpose.

34. Cyperus tegetum, Roxb. Fl. Ind. v. 1 (1832) p. 208. Glabrous; rhizome woody, stout, horizontal; root-fibres wiry, clothed with branched. hairs; stems solitary or approximate, 2-4 ft. high, trigonous or triquetrous. Leaves usually short or 0, but sometimes with long leaves 1 ft. or more long, $\frac{1}{5} - \frac{3}{8}$ in. broad, linear, acuminate; sheaths long, lax. Umbel compound or decompound; rays many, 1-5 in. long; secondary rays bearing corymbs or spikes, each with 4-10 slender spikelets; bracts sometimes reaching 15 in. long by \{\} in. broad, erecto-patent, with a strong midrib and scaberulous margins which are usually recurved in dried specimens. Spikelets $\frac{3}{8} - \frac{3}{4}$ by $\frac{1}{10}$ in., 10-30-flowered, usually reddish-brown; rhachilla with large ovate acute dark-brown deciduous wings. Glumes $\frac{1}{8}$ by $\frac{1}{30}$ in., narrowly oblong, obtuse, 3-5-nerved on the back, scarcely keeled; sides red-brown, nerveless, with narrow scarious margins incurved in dried specimens. Stamens 3; anthers 3 in. long, yellowish-brown, muticous or minutely crested. Nut 16 in. long, narrowly obovoid-oblong, tapering towards the base, minutely apiculate, trigonous, yellowish-brown; style 1/25 in. long; stigmas 3, longer than the style, capillary, not or scarcely exserted. Fl. B. I. v. 6, p. 613; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 160; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1141; Watt, Diet. Econ. Prod. v. 2, p. 688. Cyperus dehiscens, Nees, in

Linnea, v. 9 (1835) p. 286 (nomen nudum); Kunth, Enum. v. 2 (1837) p. 56; Trim. Fl. Ceyl. v. 5, p. 30. Papprus dehiscens, Nees, in Wight, Contrib. (1834) p. 89.—Flowers: Sept.

KONKAN: Cooke! Decean: Lanoli, Garade! Sind: Pinwill!-Distrib. Throughout India; Ceylon, Tropical Africa; cultivated in Mauritius.

Much employed in Calcutta for the manufacture of mats, which are sometimes imported into Europe.

35. Cyperus bulbosus, Vahl, Enum. v. 2 (1806) p. 342. stoloniferous; stolons 1-23 in. long, filiform, with bulbds formed close to the ends of the stolons; bulbils when ripe ovoid, 3 by 1 in., coated with a thick striate black integament which ultimately splits irregularly into lanceolate segments; stem 4-12 in. long, slender, trigonous, arising from a bulb, clothed at the base with black coriaceous scales, Leaves coming off at some distance from the base, below the middle of the stem and usually longer than it, reaching 1 in. broad, tapering to a fine point at the apex, spreading and recurved; sheaths very long, membranous. Inflorescence a head of umbels formed of slender alternate spikes each bearing 3-12 spikelets, the lower distant from the upper; bracts 3, very unequal, filiform, the longest 3-4 in. long. Spikelets 3-6 by 1-10 in., compre-sed, red, 8-24-flowered; rhachilla with persistent elliptic wings. Glumes 1 in. long, oblong, slightly mucronulate, cymbiform, membranous, 7-11-nerved; the sides bright red with hyaline margins in the lower part. Stamens 3; anthers $\frac{1}{16}$ in. long, linear, subacute, yellow. Nut $\frac{1}{16}$ in. long, obovoid, obtuse, triquetrous, black. Fl. B. I. v. 6, p. 611; Dalz. & Gibs. p. 284; Trim. Fl. Ceyl. v. 5, p. 22; Woodr, in Journ. Bomb. Nat. v. 13 (1991) p. 431. Cyperus jeminicus, Retz. Obs. fasc. 4 (1786) p. 11: C. B. Clarke, in Journ. Linn. Soc. v. 21 (1854) p. 175 (not of Rottb.); Watt, Dict. Econ. Prod. v. 2. p. 685.—Flowers: Dec.

Sandy shores near the sea, Dalzell & Gibson. Sixu: Hydrabad, Woodrow; Jemadar ka Landa near Karachi, Stocks!—Distrain. India (W. Peninsula); Beluchistan, Ceylon, Tropical Africa, and Australia.

The bulbs are used as flour in times of scarcity and caten roasted or boiled. When roasted they have the flavor of potatoes and would be valuable for food, but that they

are so small. See Watt, Diet. Econ. Prod. I. c.

36. Cyperus rotundus, Linn. Sp. Pl. (1753) p. 45. Glabrous; stolons elongate, slender, 4-8 in. long, bearing hard ovoid tunicate black fragrant tubers 1-1 in. in diam.; root-fibres clothed with flexuous hairs: stems subsolitary, 4-30 in. long, triquetrous at the top, sometimes tuberous at the bise. Leaves shorter or longer than the stem, narrowly linear, 1-1 in. broad, finely acuminate, flat, 1-nerved. Umbel simple or compound; rays 2 S, the longest reaching 3 in. long, bearing short spikes of 3-10 slender spreading red-brown spikelets [the inflorescence sometimes contracted into a head, occasionally (fide C. B. Clarke) of only one spikelet]; bracts 3, variable in length, the longest reaching 6 in, long, but sometimes abbreviated and much shorter than the head. Spikelets variable in length, $\frac{5}{6}-1\frac{1}{2}$ by $\frac{1}{10}$ in., linear, subscute, red-brown, 10-50-flowered, compressed; rhachilla with hyaline wings. Glumes 1 in. long, oblong, obtuse or slightly apiculate: back reddish-brown, 3-7-nerved; sides, margins, and tip hynline. Stamens 3; authors to in. long. Nut 10 in. long, broadly obovoid, trigonous, grevish-black;

style 15 in. long; stigmas 3, elongate, reaching 15 in. long, much exserted. Fl. B. I. v. 6, p. 614; Grah. Cat, p. 231; Dalz. & Gibs. p. 283; Boeck. in Linnæa, v. 36 (1870) p. 283; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 167; Trim. Fl. Cevl. v. 5, p. 35; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1141; Watt, Dict. Econ. Prod. v. 2, p. 686.—Flowers: Sept.—Nov. Vern. Moth: Motha; Nagar-motha.

Decean: Poona, Jacquemont, 382!, Bhagvat!; Lanoli, Noodrow. Sind: Bhola Puran, 25!; Bhubak, Woodrow.—Distrib. Throughout India; Ceylon, most hot countries.

A very troublesome weed of cultivation, eradicated with difficulty owing to the stolons becoming woody. The tubers are roasted and pounded, and are used in native medicine and also for giving an aroma to certain fabrics. The fragrant sticks burnt in Hindu houses contain a portion of the powder,

37. Cyperus tuberosus, Rottb. Descrip. et Icon. (1773) p. 28, t. 7, fig. 1. Perennial; rhizome creeping, woody; stolons elongate, not tuberiferous; root-fibres filiform, covered with branched hairs; stems 2-4 ft. long, slender, trigonous with tuberous base. Leaves mostly radical, usually shorter than the stem, up to 1 in broad, with smooth Umbel compound; primary rays few or many, slender, spreading, reaching 6 in. long; secondary rays terminating in 4-8 approximate spreading spikelets; bracts 3-4, the longest 1-2 ft. long with smooth margins. Spikelets $\frac{1}{2}$ - $\frac{1}{4}$ in long, reddish-brown, somewhat turgid along the median line, 16-24-flowered; rhachilla slender, with hyaline wings, Glumes suberect, reaching & in. long, oblong-lanceolate, apiculate, keeled: the back reddish-brown, 3-5-nerved, the sides hyaline. Stamens 3; anthers narrow, muticous, yellowish-brown, Nut 1 in. long, broadly obovoid, tapering towards the base, umbonate, granulate, trigonous, grey; style reaching 1 in. long; stigmas 3, capillary, 1-1 in. long. Not distinguishable from Cyperus rotundus by any good characters and it might well be united with it. Fl. B. I. v. 6, p. 616; Boeck, in Linnæa, v. 36 (1870) p. 285 (exclud. Cape plants and description of nut); Trim. Fl. Ceyl. v. 5, p. 33; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1141. Cyperus tenuiflorus, Roxb. Fl. Ind. v. 1 (1832) p. 199; Dalz. & Gibs. p. 284. C. rotundus var. procerula, C. B. Clarke, in Journ. Linn. Soc. v. 21, p. 172.

Konkan: Lawl; Matheran, Woodrow; Thana, Woodrow. Discran: Poona, Woodrow. — Distrib. India (C. Bengal, W. Peninsula); Coylon, Mauritius, Australia.

38. Cyperus exaltatus, Retz. Obs. fasc. 5 (1789) p. 11. A large glabrous herb; stolons 0; root-fibres stout; stems 3-6 ft. long, obtusely trigonous. Leaves few, longer or shorter than the stem, linear, $\frac{1}{4}$ - $\frac{3}{8}$ inbroad, finely acuminate, 1-nerved, multistriate, with more or less scaberulous margins. Umbel compound; rays 5-10, sometimes reaching 6 in. long, spreading, bearing spikes $\frac{3}{4}$ -2 in. long of 20-40 rather distant short spikelets; bracts 3-6, leaf-like, the longest up to 2 ft. long. Spikelets $\frac{1}{1}$ - $\frac{1}{4}$ by $\frac{1}{10}$ in., ascending, narrowly elliptic-lanceolate, chest nutbrown, much compressed, 8-16-flowered; rhachilla with narrow peristent wings. Glumes $\frac{1}{12}$ in. long, closely imbricate, ovate-oblong, nucronate; back green, obscurely 3-nerved; sides chest nut-brown, not or scarcely nerved, the margins not or sometimes very narrowly scarious. Stamens 3; authers $\frac{1}{26}$ in. long, yellow, muticous. Nut $\frac{1}{30}$ ip. long, ellipsoid, tapering

to both ends, trigonous, brown or yellow; style $\frac{1}{20}$ in. long; stigmas 3, rather shorter than the style, capillary, exserted. Fl. B. I. v. 6, p. 617; Boeck. in Linnæa, v. 36 (1870) p. 319; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 186; Trim. Fl. Ceyl. v. 5, p. 32; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1141; Watt, Dict. Econ. Prod. v. 2, p. 684. Cyperus umbellatus, Roxb. Fl. Ind. v. 1 (1832) p. 205; Dalz. & Gibs. p. 284.—Flowers: Sept.

Konkan: Karjat, Woodrow. Decean: Dalzell & Gibson; Lanoli, Woodrow. S. M. Countar: Dambal (Dharwar districts), Dalzell!—Distrite. India (Panjáb, W. Peninsula); Coylon, Tropical Africa, Indo-China, Australia.

Van. dives, C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 187. Spikelets more turgid, yellow or golden-yellow, shining, horizontally spreading; glumes with scarious margins. Fl. B. I. v. 6, p. 617. Cyperus dives (sp.), Delile, Fl. Egypte (1812) p. 149, t. 4, fig. 3.

Sixp: Pinwill!-Distrib. India (Bengal); Africa.

39. Cyperus digitatus, Roxb. Hort. Beng. (1814) p. S1. Perennial, glabrous; rhizome stout, woody, creeping; stolons 0; root-fibres stout. Stems 1-4 ft. long, trigonous or triquetrous above, with smooth angles. Leaves longer or shorter than the stem, 1-3 in. broad, flat, coriaceous, multistriate, with scaberulous margins. Umbel very large, broad, up to 12 in. in diam., simple or compound: rays 4-10, trigonous, 2-6 in. long, terminated by stellately spreading sessile or cylindric spikes of unequal length, loosely set all round with innumerable horizontally spreading spikelets; bracts 3-6, leaf-like, the longest reaching sometimes 1 ft. long or more; bracteoles very slender; spikes $1-1\frac{1}{2}$ by $\frac{3}{3}-\frac{1}{2}$ in., sessile or a few pedicellate. Spikelets $\frac{1}{6}-\frac{1}{4}$ by $\frac{1}{2}0$ in., subterete, acute, 12-20-flowered, spreading horizontally, yellowish-brown; rhachilla with lanceolate acute scarious deciduous wings. Glumes $\frac{1}{16}$ by $\frac{1}{46}$ in., with rounded shortly cuspidate tip; back chestnut-brown, somewhat obscurely 3nerved; sides hyaline. Stamens 3; anthers linear-oblong, not crested. Nut 10 in. long, ellipsoid, tapering at both ends, straight or slightly curved, trigonous, yellowish; style 10 in. long; stigmas 3, slightly longer than the style, capillary. Fl. B. I. v. 6, p. 618; Trim. Fl. Ceyl. v. 5, p. 36; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1141. Cyperus Necsii, Boeck. in Linnwa, v. 36 (1870) p. 315. Cyperus. auricomus, C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 188 .-Flowers: Sept.

Konkan: Law! Drecan: Lanoli, Woodrow; Poona, Woodrow, 204! S. M. Countny: Londa, Cooke!—Distrim. India (E. Bengal, Assam, Pegu, Moradabad, Sikkin, W. Peninsula); Ceylon, Ethiopia, China, Malaya, Oceania.

40. Cyperus Clarkei, T. Coske. Rootstock tuberous; stolons elongate, $\frac{1}{25}$ in. in diam., clothed with oblong-lanceolate striate palebrown scales; stems 3-S in. long, thick, trigonous, from a bulbous base. Leaves longer or shorter than the stem, $\frac{1}{6}$ - $\frac{1}{4}$ in. broad, linear, very acute; lower sheaths much inflated, striate, brown. Umbel simple, with very short rays, or subcapitate; spikes 5-8, cylindric, dense, pale, $\frac{1}{2}$ - $\frac{3}{4}$ by $\frac{1}{4}$ - $\frac{3}{8}$ in.; bracts 5-7, leaf-like, the longest reaching 6 in. long. Spikelets $\frac{1}{4}$ - $\frac{1}{4}$ in. long. densely packed, spreading nearly at right angles, bearing 1 nut. Nut-bearing glumes ovate, acute, multistriate, straw-colored.

Stamens 3, with long filaments. Nut $\frac{1}{1}\frac{1}{2}-\frac{1}{10}$ in, long, ellipsoid, trigonous, brown; style $\frac{1}{27}$ in. long, stigmas rather shorter than the style. Mariscus bulbosus, C B. Clarke, in Hook. f. Fl. B I. v. 6 (1893) p. 620; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431. Kyllinga bulbosu, Kænig, in Vahl, Enum. v. 2 (1806) p. 376 (in nutc).—Plawers: Oct

S M Country Woodrow, 36; Badami, Woodrow, Dharwar, Woodrow Kanara; N. Kanara, Young ex C. B. Clarke—Distrib India (W Pennsul).

As the name Cyperus bulbosus is preoccupied by Valil's plant [Valil, Enum v 2, (1896) p 342], I have had to find a new name for this, and, as it was first described by Mr C B Clarke, I have adopted the name C. Clarke.

41. Cyperus konkanensis, (nov. sp.) T. Cool c. Rhizome short; stolons 0 on the only specimen seen; root-fibres stout; stems reaching 30 m. long from a thickened base, stout, trigonous, striate, smooth, about 1 in. in diam. at the base. Leaves 11-2 ft. long; sheaths reaching 6-10 in. long, strinte. Inflorescence reaching 9 in. long. Umbel compound, with 4-6 long rave up to 7 in. long, and some sessile spikes at its base, secondary umbels with 3-4 sessile spikes of many widely spreading spikelets; bracts of primary umbel \(\frac{1}{2}-2\) ft. long, up to \(\frac{1}{2}\) in. broad, leaf-like; bracts of secondary umbel \(\frac{1}{2}-1\) in. long, filiform; bracteoles 1-1 in, long, lanceolate or mistate from a lanceolate base. Spikelets exceeding 1 in. long, lanceolate, subterete, 30 in. in diam., somewhat distantly placed along the thachis, shining, straw-colored. Lowest glume 10 in. long, oblong, obtuse, scarious, with parallel nerves. Upper glumes 4 in. long, twisted, wrapped round the nut, deeply striate to the margins which are not hyaline. Stamens 3; anthers 16 in. long, narrow, pointed, reddish brown. Nut \(\frac{1}{6}\) by \(\frac{1}{40}\) in., oblong, trigonous, pale-brown; style 10 in. long; stigmas 3, reaching 1 in. long, much exseited. Maissus Sieberianus, Woodr. in Jouin. Bomb. Nat. v. 13 (1901) p. 431 (not of Nees). ? Manuscus umbellatus, Dala. & Gibs. p. 285.

KONNAN Western Glifts, Woodrow, 34!

There is but one sheet from the Bomba, Presidency in Herb Kew. collected by Woodrow, containing 1 specimen only. Mr Clirke has labelled the specimen Maricus Steberiaus var. subcomposita (formi gigantea), and in a pencilled note on the sheet remarks? Sp. nota. It is a much larger and coarser plant than the var. subcomposita alluded to, the spikelits are not closely picked but rather distant, the glumes are distinctly twisted and conspicuously structe up to the non-hyaline margins.

42. Cyperus paniceus (Mariscus), Vahl, Enum. v. 2 (1806) p. 373. Var. Roxburghiana, C. B. Clarke, in Hook. f. Fl. B. I. v. 6 (1893) p. 621 (under Mariscus). Perennial, rootstock small, horizontal, stoloniferous; stolons slender, rigid; steins up to 2 ft. long, trigonous, smooth. Leaves long, narrow, 1-nerved. Umbel simple; rays reaching sometimes 2 in. long; spikes reaching 1 by \(\frac{1}{2}\)-\frac{1}{4} in., cylindric; the rhachis closely clothed with the persistent lower glumes of the spikelets; bracts 5-7, the longest reaching 10 or 11 in. long, leaf-like. Spikelets \(\frac{1}{2}\)-\frac{1}{6} in. long, consisting of 4 glumes, the 2 lowest empty, scarious, the third tertile, the fourth empty, lanceolate, with a long subulate tip; rhachilla winged above the articulation. Nut-bearing glume \(\frac{1}{6}\)-\(\frac{1}{6}\) in. long, lanceolate-subulate, convolute, wrapped round the upper glume and mut; back strongly 3-nerved; sides scarcely striate, often dotted with brown spots, and with narrowly hyaline margins. Stamens 3; anthers long, slender. Nut nearly \(\frac{1}{6}\) in. long, slightly curved, oblong-ellipsoid, attenuated at

each end, trigonous, pale-brown; style $\frac{1}{45}$ in. long; stigmas 3, longer than the style, capillary. Mariscus experinus, Nees, in Wight, Contrib. (1834) p. 90, var. a (not of Vahl). Scirpus echinatus, Linn. Sp. Pl. (1753) p. 50. Kyllinga umbellata, Roxb. Icon. ined. t. 191.

Korkan: Low:--Distrin. More or less throughout India; Ceylon, Java. There is but one sheet in Herb. Kew. from the Bombay Presidency ticketed "Konkan, Law," containing two specimens (without leaves) which consist each of a piece of the upper portion of a stem less than 3 in, long, carrying spikes and bracts.

43. Cyperus pennatus, Lam. Illust. v. 1 (1791) p. 144. Perennial; rootstock tuberous, woody, stoloniferous; root-fibres very stout; stem 2-3 ft. by 1 in. or more in diam., stout, trigonous, smooth. Leaves longer than the stem, sometimes reaching 4 ft. long by 1 in. broad, corraceous, sometimes septato-punctate, the margins and keel scaberulous. Umbel compound, 4-8 in. in diam., with 4-8 stout rays 1-3 in. long and short secondary ray ile spikes \-1 in. long, covered with stout : bracts 4-6, leaf-like, up to 16 in. long. Spikelets 4-76 in. long, reddish-brown or strawcolored, oblong-lanceolate, acute, subterete, 3-6-flowered; rhachilla with short winged internodes. Glumes closely imbricate, concave, ovate, subobtuse, the nut-bearing ones reaching & in. long, dorsally rounded, spotted with brown; nerves many, slender, the margins narrowly hyaline. Stamens 3; anthers small, oblong. Nut 15 in. long, ellipsoid, trigonous, black when ripe; style $\frac{1}{20}$ in. long; stigmas 3, longer than the style. C. B. Clarke, in Journ. Linn. Soc. v. 21, p. 194. Cuperus canescens, Boeck. in Linuxa, v. 36 (1870) p. 340. Mariscus albescens, Gaud. in Freye. Voy. But. (1826) p. 415; C. B. Clarke, in Hook. f. Fl. B. I. v. 6, p. 623; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain. Beng. Pl. p. 1146.—Flowers: Oct.

Korkan: Cooke!; Mahad, Woedrow. Decean: Lanoli, Woodrow.—Distrib. India (Bengal, Birma, W. Peninsula); Ceylon, Ethiopia, China, Malaya, Oceania.

Cyperus stuppeus, Forst, Prodr. (1786) p. 89, should perhaps as the older name have precedence.

44. Cyperus dilutus, Vahl, Eaum. v. 2 (1806) p. 357. Perennial. glabrous; rootstock short; stem 1-4 ft. long, obtusely trigonous, smooth. Leaves as long as or longer than the stems, up to \frac{1}{2} in. broad, coriaceous or spongy, septato-punctate, the margins and keel scaberulous. Umbel large, decompound; rays many, trigonous, up to 6 in. long, simple or bearing secondary or tertiary umbellules, the ultimate rays terminated by globose heads (contracted spikes) 3-1 in. in diam., of innumerable narrow stellately spreading spikelets; bracts many, long and broad in large specimens, few and narrow in small ones, leaf-like. Spikelets 1-1 in. long, slender, terete, red-brown, shining, bearing 4-14 nuts; rhachilla very slender, with internodes about $\frac{1}{12}$ in. long, and oblong persistent wings. Glumes reaching 1 by 10 in., loosely imbricate, faintly nerved, straight, oblong or oblong-lanceolate, obtuse, dorsally rounded, the margins not hyaline. Stamens 3; anthers $\frac{1}{2n}$ in, long, reddish-brown, muticous. Nut (not including beak) reaching 1 in. long, oblanceolate-oblong, narrow, acutely trigonous, stipitate, distinctly beaked: style shorter than the nut; stigmas 3, exserted. Boeck in Linnæa, v. 36 (1870) p. 354; C. B. Clarke, in Journ. Linn. Soc. v. 21 (1884) p. 193. Cyperus spinulosus, Roxb. Fl. Ind. v. 1 (1832) p. 203.

Mariscus microcephalus, Presl, Rel. Haenk. (1830) p. 182; C. B. Clarke, in Hook, f. Fl. B. I. v. 6, p. 624.

Sind: Pinwill! -Distrib. More or less throughout India; Coylon, Mauritius, China, Malaya.

EXCLUDED SPECIES.

CYPERUS GLABER, Linn. Mantiss. (1771) p. 179. Spikelets tinged with red: glumes muticons or nearly so; nut obovoid, obtuse, minutely conic-apiculate (otherwise as C. compressus). C. B. Clarke, in Hook. f. Fl. B. I v. 6, p. 606.

There is no specimen of C. glaber in the Indian bundles in Herb. Kew.

OFFERUS LICULLINTUS, Linn. Sp. Pl. (1753) p. 45. Stolons long, slender, bearing tubes, spikelets yellow or brownish; glumes plicate-striate over nearly their whole breadth. C. B. Clarke, in Hook. f. Fl. B. I. v. 6, p. 616; Woodr. in Journ. Bomb.

Nat. v. 13 (1901) p. 431.

There is in Herb Kew, a solitary specimen from Jacquemont (No. 277) which, according to the ticket on it, was collected between Ellora and Poona. As Ellora is in the Nizam's dominions, and at least 120 miles from Poona, and as no preciso locality has been given, the existence of the plant in the Bombay. Presidency is extremely doubtful, especially as no Bombay botanists have apparently met with it.

2. KYLLINGA, Rottb.

Perennial herbs tufted or with a creeping rhizome; stem trigonous, leafy below only, terminated by 1-3 sessile capitate spikes. Leaves narrow. Spikelets minute, green, strongly laterally compressed, 1-2flowered, densely packed on short sessile oblong or globose involucrate spikes; rhachis short, naked after the fall of the spikelets, or squarrosely covered with the more or less persistent lowest glumes; rhachilla very minute, disarticulating above the two lowest glumes. Glumes 4, distichous, the two lowest hyaline, empty, much shorter than the third and fourth, the third and fourth much the largest, often green and speckled with brown, subequal or the upper longest, unequal-sided, keeled; keel sometimes winged, apiculate or cuspidate. Stamens 1-3; anthers long or short. Ovary suborbicular; style long or short, not swollen at the base; stigmas 2, linear. Fruit a strongly laterally compressed smooth nut, sometimes apiculate by the persistent style-base.-DISTRIB. All hot and temperate regions except Europe; species 33.

Nut-bearing glume winged in upper half of keel; rhizome crceping, elongate 1. K. monocephala. Nut-bearing glume not winged in upper half of keel; rhizome

1. Kyllinga monocephala, Rotth. Descrip. et Icon. (1773) p. 13, t. 4, fig. 4. Glabrous or nearly so; rhizome creeping, elongate; stems 3-12 in. high, usually solitary, erect. Leaves shorter than the stem, 10 h in. broad, linear, acute with a strong midnerve. Spikes solitary (rarely 2-3), the lateral when present very small, the middle spike $\frac{1}{4}-\frac{1}{3}$ in. in diam.; rhachis naked or pitted after the fall of the spikelets, the lowest glumes mostly deciduous; floral bracts 3-4, very long and narrow, similar to the leaves. Spikelets $\frac{1}{10}$ in. long, 1-flowered. Two outer glumes hyaline, the lowest glume narrowly ovate-lanceolate, $\frac{1}{10}$ in. long, the second glume broadly ovate, obtuse; glumes 3 and 4 green, often sparsely speckled with brown, falcately incurved, acuminate, the upper

slightly the longer, but no. 3 the broader, the keel dorsally winged about the middle, the wings spinulose, sometimes obscurely developed. Anthers small. Nut obovoid or oblong, compressed, rather more than half as long as the glume, pale reddish-brown; style rather more than $\frac{1}{3}$ in. long; stigmas 2, filiform, as long as the style. Fl. B. I. v. 6, p. 588; Grah. Cat. p. 232; Dalz. & Gibs. p. 285; Trim. Fl. Ceyl. v. 5, p. 44; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430; Prain, Beng. Pl. p. 1135.

- S. M. Counter: Londa, Cooke! Distrib. Throughout India; Ceylon, hot and warm temperate regions of the Old World except the Mediterraneau.
- 2. Kyllinga triceps, Rottb. Descrip. et Icon. (1773) p. 14, t. 4, fig. 6. Glabrous; rhizome very short or 0; stems 2-9 in. long, tufted. Leaves as long as (rarely longer) but usually shorter than the stem, $\frac{1}{1-\frac{1}{2}}$ in. broad, linear, acute. Spikes ovoid-oblong or subcylindric, usually 3 together (rarely solitary), the middle one the largest, $\frac{1}{2}-\frac{1}{2}$ in. in diam.; rhachis clothed, after the fall of the spikelets, with the persistent lower glumes; bracts beneath the head 3-4, leaf-like, up to 3 in. long. Two lower glumes hyaline, the lowest lanceolate, acuminate, $\frac{1}{20}$ in. long, the second lanceolate or suborbicular, the third and fourth herbaceous, membranous, green not speckled with brown, ovate-lanceolate, obtusely apiculate, strongly nerved, the uppermost (fourth) rather the longest, $\frac{1}{2}$ in. long. Stamens 2. Nut oblong or ellipsoid-oblong, yellowishbown, much compressed, $\frac{1}{16}$ in. long; style with 2 filiform stigmas, together nearly as long as the nut. Fl. B. I. v. 6, p. 587; Grah. Cat. p. 232; Wight, Contrib. p. 91; Trim. Fl. Ceyl. v. 5, p. 45; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 430.—Flowers: Sept.

Decean: Poona, Jacquemont, 345!, Woodrow. Sind: Pinwill!—Distrib, India (N.-West, Sind, Bengal, Birma); Oeylon, Africa, China, Australia.

3. COURTOISIA, Nees.

Herbs with erect simple stems, leafy only near the base. Leaves grass-like. Spikelets compressed, in globose spikes; rhachilla disarticulating above the two lowest glumes. Glumes persistent, I and II empty; 1-3 above them hermaphrodite, nut-bearing, winged on the keel; uppermost sterile or empty. Stamens 3; anthers oblong. Ovary ovoid; style short, persistent; stigmas 3, linear, longer than the style. Fruit a trigonous nut with acute apex, continuous with the style.—Distrib. India, Africa, Madagascar; species 2.

1. Courtoisia cyperoides, Necs, in Linnaa, v. 9 (1835) p. 286. Annual, glabrous, whole plant of a yellowish hue; root fibrous; stems 3-16 in. long, exspitose, slender, trigonous, striate, leafy towards the base. Leaves usually longer than the stems, linear, acute, \(\frac{1}{10} \) \\ \dots \) in. broad. Umbel simple or compound, with 3-10 rays 1-3 in. long; secondary rays 3-5 up to 1 in. long, bearing dense globose yellowish-brown spikes composed of many short spikelets; bracts 3-7, leaf-like, 4-15 in. long; secondary bracts often \(\frac{1}{2} \) in. long. Spikelets \(\frac{1}{2} \) in. long, many, in globose heads \(\frac{1}{2} \) \frac{1}{2} in. in diam. Glumes boat-shaped, flattened, the fertile ones slightly mucronate, the keel with a continuous glistening wing along its whole length; sides not striate. Stamens 3; anthers

oblong. Nut rather more than $\frac{1}{5}$ in. long, narrow, trigonous, fusiform, tapering at both ends, almost beaked, chestnut-brown, granulate; style short, continuous with the nut; stigmas 3, filiform. Fl. B. I. v. 6, p. 625; Dalz. & Gibs. p. 285; Boeck. in Linnæa, v. 35 (1868) p. 434; Benth. in Hook. Icon. Pl. (1880) t. 1341; Nees, in Wight, Contrib. (1834) p. 92; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1147. Kyllinga cyperoides, Roxb. Fl. Ind. v. 1 (1832) p. 182; Grah. Cat. p. 232.

KONKAN: Law!

There is but one specimen in Herb. Kew, marked as above, and while Woodrow retains the plant in his list he does not indicate any locality where it is to be found,—Distrin. India (Sikkim, Assau, Bengal, Pegu, W. Peninsula); Tropical Africa, Madagascar.

4. FIMBRISTYLIS, Vahl.

Annual or perennial herbs; roots fibrous or woody; stolons 0; stems tufted. Leaves near the base of the stem, rarely reduced to sheaths, narrowly linear or filiform. Spikelets terete, angular or compressed, many-flowered, in a terminal umbellate or capitate inflorescence. Glumes imbricate spirally round the rhachilla, or the lower glumes distichous, glabrous (very rarely pubescent), deciduous, the lower 1-3 and sometimes the upper empty, the others 2-sexual; hypogynous bristles 0. Stamens 1-3; filaments flat; anthers linear, obtuse or acute, or subulately tipped. Ovary obovoid, somewhat flattened or trigonous; style long, base more or less dilated, flattened or slender, glabrous, pubescent or villous, wholly deciduous; stigmas 2 in the flattened, 3 in the trigonous ovaries, usually filiform and elongate. Fruit an obovoid biconvex or trigonous (very rarely cylindric) nut.—Distrib. Nearly all hot and warm regions, especially plentiful in S.E. Asia and N.E. Australia; species 125.

Stigmas 2. Spikelets solitary, terminating the stem (rarely 2 or	
3 in polythricioides).	
Leaves 0 or very short (see also F. ferruginea);	
nut subcylindric, curved	1. F. tetragona.
Leaves like the stem; nut turbinate.	9 F maledlainininidan
Nut sessile, yellow dotted with white spots	2. F. polythricioides.
Nut stipitate, snow-white with a brown patch on each face	3. F. schænoides.
Spikelets umbellate or capitate.	
Annuals (F. diphylla sometimes perennial).	
Spikelets umbellate.	
Nut with 6-9 broad trabeculate ribs; stamens 1-3	4. F. dichotoma.
Nut smooth; stamen I	5. F. astivalis.
Spikelets capitate	6. F. argentea.
Perennials (F. diphylla sometimes annual).	G. I. argeneeus
Leaves 0 or very short; stamens 2-3	7. F. ferruginea.
Leaves many.	1. Jornaginea.
	8. F. diphylla.
Glumes mucronate; stamens 1-3	6. F. alphytta.
Glumes with obtuse hyaline fips; stamens usually 2	9. F. spathacea,
Stigmas 3.	•
Spikelets terete or polygonal, none of the glumes distichous.	
Stems 6-24 in. long.

1. Fimbristylis tetragona, R. Br. Prodr. (1810) p. 226. Perennial, glabrous; root-fibres stout; stems 6-24 in. long, tufted, slender, quadrangular, ribbed. Leaves 0, or the upper sheaths with an erect lanceolate acuminate limb; sheaths usually brown. Spikelet solitary, $\frac{1}{4} - \frac{3}{5}$ in. long, erect, ovoid-conic, terete, obtuse; lowest glume sometimes hardly bractiform, at others & as long as the spikelet, coriaccous, decidnous; rhachilla thickly studded with deep tetraganal pits with raised edges. Glumes closely imbricate, 1 in. long, broadly oblong or obovate-oblong, rounded at the apex, concave, embracing the nut, scarious, with a broad coriaceous central band. Stamens 2; filaments flattened, dark-brown (nearly black); anthers narrowly linear, Nut I in. long (not including the style-base or the stalk), linear-oblong or subcylindric, narrow, tapering towards the base, slightly curved, with a long slender stalk, trabeculate with slender parallel ribs and minute cross bars, pale straw-colored (nearly white), deciduous with the glume; style villous, flattened, as long as the nut, with a large subpersistent conical compressed base; stigmas 2, short. Fl. B. I. v. 6. p. 631; Trim. Fl. Ceyl. v. 5, p. 48; Woodr. in Journ, Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1150. Fimbristylis cylindrocarpa, · Boeck, in Linnaa, v. 37 (1871) p. 7.—Flowers: Oct.

Dalzell without locality in Herb. Kew.! Konkan: Slockel; Salsette, Jacquemont, 7471 Kanara: Law! Deccan: Hirdosi, Woodrow; Mawal (Poona districts), Woodrow,—Distrib Throughout India (except the North-West); Ceylon, E. Asia, Australia.

2. Fimbristylis polythricioides (Scirpus), Vahl, Enum. v. 2 (1806) p. 248. Perennial, glabrous; root-libres filiform; stems 2-10 in. long, uliform, leafy at the base, trigonous, striate. Leaves \(\frac{1}{2} \) as long as the stem or longer, slender, wiry, acute, tereteor trigonous, striate; sheaths glabrous or puberulous. Spikelet solitary, \(\frac{1}{4} \) in. long, erect, oblong-ellipsoid, many-flowered; rhachilla stout, terete, deeply pitted. Glumes \(\frac{1}{4} \) in. long, linear-oblong, cymbiform, subobtuse or acute, minutely apiculate, membranous, with a narrow central band, pale straw-colored or almost white. Stamens 1-3; filaments flattened, membranous, white. Nut \(\frac{1}{16} \) in. long, turbinate, sessile, much compressed, subtruncate at the apex, biconvex, with acute margins, yellow, dotted with white spots; style \(\frac{1}{20} \) in. long, slightly hairy, scarcely dilated at the base, deciduous; stigmas 2, as long as the style. Fl. B. I. v. 6, p. 632; Trim. Fl. Ceyl. v. 5, p. 49; Woodr.

in Journ Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1150. Fimbristylis juncea, Boeck. in Linnaa, v. 37 (1871) p. 4 (not of Rom. & Schult.).—Flowers: Sept.-Oct.

Комкан: Sion (Bombay), Woodrow!—Distrib. India (Bengil, Sundribans, W. Peninsula), Ceylon, Malacca.

3. Fimbristylis schenoides, Vahl, Enum. v. 2 (1806) p. 286. A glaucous herb; rhizome 0, or rarely horizontal and very short; rootfibres slender; stems 4-18 in. long, tufted, slender (almost filiform), obtusely angled, striate. Leaves usually shorter but hardly broader than the stem, $\frac{1}{20}$ in. broad or less, narrowly linear, very acute, coriaceous, striate above, dotted beneath, with recurved spinulose margins; sheaths glabrous with membranous margins. Spikelets 1-1 in. long, solitary or 2-5 in an irregular umbel, sessile or on slender pedicels; bracts 2, very variable, usually shorter than the spikelets [in one specimen from Khadkala (Deccan) collected by Woodrow there are 2 leaf-like bracts below the umbel which one of them exceeds]; rhachilla slender. Glumes deciduous, loosely imbricate, $\frac{1}{8}$ in. long and about as broad as long, orbicular, obtuse, shortly apiculate, very concave, membranous, with 5-7 slender central nerves, straw-colored or pale brown. Stamens 3; anthers acute. Nut $\frac{1}{16}$, $\frac{1}{12}$ in. long, turbinate, compressed, biconvex, rounded at the apex, smooth, shortly stipitate, snow-white with a brown patch in the centre of each face; style $\frac{1}{10}$ in. long, the upper half villous, the base enlarged, cylindric or subglobose; stigmas 2, short. Fl. B. I. v. 6, p. 634; Boeck. in Linnaa, v. 37 (1871) p. 5; Trim. Fl. Ceyl. v. 5, p. 49; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1150.—Flowers: Sept.

KONKAN: Woodrow. DECCAN: Khadkala near Lanoli, Woodrow! SIND: Pinwill!—DISTRIB. Throughout India; Ceylon, China, Malaya, Australia.

4. Fimbristylis dichotoma, Vahl, Enum. v. 2 (1806) p. 287. Annual: root-fibres slender: stems 2-10 in. long, tufted, filiform, striate, smooth. Leaves usually shorter than the stems, very narrow, in. broad, tapering to a fine point, smooth; sheaths softly villous. Umbel laxly compound or decompound, 1-2 in. in diam.; rays few or many, up to 1 in. long, suberect; bracts filiform, shorter or longer than the umbels. Spikelets $\frac{1}{6} - \frac{1}{4}$ by $\frac{1}{16} - \frac{1}{12}$ in., somewhat angular from the acute keels to the glumes, ellipsoid, many-flowered; rhachilla stout, angular, with large pits. Glumes loosely imbricate, all, or all but the lowest fertile, 15 by 30 in., ovate, reddish-brown, 1-3-nerved on the back, the midnerve forming a conspicuous acute green keel which is prolonged into a cuspidate point. Stamens 1-3; anthers small, obtuse. Nut 10 30 in. long, broadly turbinate, minutely stipitate, umbonate, compressed, biconvey, with 6-9 broad trabeculate ribs, pale strawcolored or almost white; style 10 in. long, densely villous in the upper part, or sometimes all over, with a small globose bulbous base; stigmas 2, recurved. Fl. B. I. v. 6, p. 635; Boeck. in Linnan, v. 37 (1871) p. 12; Trim. Fl. Ceyl. v. 5, p. 50; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1151 .- Flowers: Oct .- Apr.

Konkan: Dalzell, Lambert:, Stocks! Deccan: Khandala, Woodrow. Gujarat: Bodoli, Woodrow. Sind: Stocks, 1204!—Distrib. Throughout India especially in rice-fields; Coylon, warm regions of the Old World.

5. Fimbristylis æstivalis, Vahl, Enum. v. 2 (1806) p. 288. An annual glaucous herb, more or less slightly pubescent; roots fibrous; stems 2-8 in. long, erect, trigonous, filiform, striate. Leaves shorter than the stem, very narrow, acute. Umbel compound or subdecompound, lax, with many slender erect rays; bracts 3-5, the longest usually much exceeding the umbel, narrowly linear, acute, leaf-like, pubescent. Spikelets 1-1 by 1-10 in., elliptic-oblong, brown, the two lowest glumes empty, bract-like, To in. long, longer than the others, with a hispid keel which is produced into a long recurved mucro, and usually with hyaline margins; rhachilla prominently scarred. Glumes (fertile) In in. long, oblong, puberulous, subcrect; back strongly keeled, the keel produced into a stout mucro about 10 in. long, which is often pubescent; sides streaked with reddish-brown, the margins not hyaline. Stamen 1. Nut scarcely 10 in. long, orbicularly obovoid, much compressed, biconvex, with an acute margin, narrowed to the base, strawcolored, smooth, slightly umbonate; style about $\frac{1}{40}$ in. long, slightly pubescent, with a bulbous base; stigmas 2, recurved, nearly as long as the style. Fl. B. I. v. 6, p. 637; Boeck, in Linnea, v. 37 (1871) p. 11; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1151.—Flowers: Sept.-Dec.

KONKAN: Matheran, H. M. Birdwood, Woodrow. Deccan: Mawal (Poona districts), Woodrow: Kanara, Law!—Districts. More or less throughout India, S. and E. Asia, Australia. Sir Joseph Hooker (Trim. Fl. Ceyl. v. 5, p. 51) considers the Ceylon plant a distinct species and not conspecific with Vahl's plant, which latter he says has not hitherto been found in Ceylon.

6. Fimbristylis argentea, Vall, Enum. v. 2 (1806) p. 294. A densely tufted glaucous glabrons annual; root-fibres filiform; stems many, 4–8 in. long, filiform, trigonous, striate. Leaves shorter and often more slender than the stem, flexuous, smooth, canaliculate, acute; sheaths short, glabrous. Spikelets $\frac{1}{6} - \frac{3}{6}$ in. long, 3–20, sessile, forming a terminal globose head, cylindric-oblong, terete, obtuse, many-flowered; bracts 3–4, much longer than the head, reaching 3 in. long. Glumes $\frac{1}{16}$ in. long, closely imbricate, ovate, obtuse, not cuspidate; back with a strong green keel, obscurely 3-nerved; sides brown, with hyaline margins. Stamen 1. Nut $\frac{1}{16}$ in. long, orbicalarly obovoid, compressed, biconvex, shortly stipitate, with narrow acute margins, straw-colored, quite smooth, umbonate; style $\frac{1}{30}$ in. long, minutely hairy in the upper part, with a bulbous base; stigmas 2, shorter than the style. Fl. B. I. v. 6, p. 640; Dalz. & Gibs. p. 287; Boeck. in Linnæa, v. 37 (1871) p. 8; Prain, Beng. Pl. p. 1151. Scirpus argenteus, Rottb. Descrip. et Icon. (1773) p. 51, t. 17, fig. 6; Grah. Cat. p. 232.

This is given for the Bombay Presidency on the authority of Dalzell & Gibson (Bo. Fl. 1.c.), who assign no locality to the plant. Woodrow does not include it in his list of plants and there are no specimens from the Bombay Presidency in Herb. Kew. The plant seems to be tolerably common in Madras.—District. India (Bengal, W. Peninsula); Ceylon, Mauritius.

7. Fimbristylis ferruginea, Vald, Enum. v. 2 (1806) p. 291. ? Perennial; rhizome 0 or scarcely any; root-fibres stout and slender; stem 1-2½ ft. long, subtrigonous. Leaves 0 or few, short, very narrow, glabrous or hairy; sheaths pubescent, thin. Umbels simple or subcompound, of few spikelets; bracts shorter than the umbel striate,

 slender. Spikelets $\frac{2}{5}$ by $\frac{1}{5}$ in., ellipsoid, pale reddish-brown, pubescent, the lowest spikelets usually bractiform, variable, $\frac{1}{5}-\frac{1}{4}$ in. long, cuspidate, the mucro varying from $\frac{1}{20}$ to $\frac{1}{5}$ in. long, pubescent; rhachilla stout, angular, with large pits. Glumes $\frac{1}{5}$ by $\frac{1}{10}$ in., erect or slightly recurved, broadly otate, subacute, concave, shortly mucronate, chartaceous; the back with a green keel but with no conspicuous nerves. Stamens 2-3. Nut $\frac{1}{10}$ in. long, obvoid or suborbicular, narrowly margined all round, compressed umbonate, with a long stipe, pale straw-colored, not ribbed, obscurely reticulate, smooth; style $\frac{1}{10}$ in. long, flattened, slightly dilated at the base, the margins of the upper part villous; stigmas 2, short. Fl. B. I. v. 6, p. 638; Dalz. & Gibs. p. 287; Boeck. in Linnæa, v. 37 (1871) p. 16; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1151.—Flowers: Sept.—Dec.

DECCAN Poona, Cooke!, Woodrow! Sinn: Pinwill!—Distrib. Throughout India; Ceylon, China, Japan, Malaya, Australia, Polynesia.

8. Fimbristylis diphylla, Vall, Enum. v. 2 (1806) p. 289. Rhizome 0 or rarely up to 1 in. long, stout; root-fibres rather stout; stolons 0; stems 6-24 in. long, tutted, slender, angled, striate, smooth. Leaves usually shorter than the stem, 12 1 in. broad, linear, coriaceous, rather rigid, often serrulate towards the acute tip, striate above, obscurely 2-nerved beneath, and with scaberulous margins; sheaths glabrous or pubescent, rather short. Umbel simple or compound (or spikelets in a compact head); rays few, very unequal, up to 2 in. long; bracts filiform, long or short. Spikelets scattered or clustered, 1-3 in. long, ovoid, acute, terete, the lowest 1-3 glumes empty, smaller than the others, deciduous (rarely elongate and bract-like); rhachilla stout, Glumes 1 by 10 in., broadly ovate, acute, apiculate, concave, chartaceous, loosely imbricate; keel obtuse, green, 3-nerved, the midrib reaching the tip; sides chestnut-brown. Stamens 1-3; anthers long with a conical tip. Nut 1 in. long, broadly or orbicularly ovoid, compressed, biconvex, shortly stipitate, many-ribbed, trabeculate, umbonate, pale straw-colored or nearly white; style 15 in. long, very broad, villous throughout, base dilated, truncate; stigmas 2, short. v. 6, p. 636; Trim. Fl. Ceyl. v. 5, p. 53; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1151. Fimbristylis polymorpha, Boeck, in Linua, v. 37 (1871) p. 14.—Flowers: Aug.

KONKAN: Stocks!, Woodlow. KANARA: Talbot, 601, ex C. B. Clarke, in Journ. Linn. Soc v. 34, p. 58. Sind: Pinuill!—Distrib. Throughout India; Ceylon, most warm regions.

9. Fimbristylis spathacea, Roth, Nov. Pl. Sp. (1821) p. 24. Rhizome short or elongate, stout, woody; root-fibres both stout and slender; stems densely leafly below, $\frac{1}{2}-\frac{1}{2}$ ft. long, stout, obtusely trigonous. striate. Leaves many, densely crowded on the rootstock, much shorter than the stem, spreading and recurved, narrowly linear, obtuse or acute, up to $\frac{1}{10}$ in. broad, rigidly coriaceous, with recurved scaberulous margins; sheaths short, open, coriaceous. Umbel simple or compound, open or with the spikelets more or less crowded, sometimes into a globose head, but almost always pedicellate; bracts short, rigid, erect, leaf-like, with broadly dilated base which often has membranous margins. Spikelets $\frac{1}{8}$ by $\frac{1}{10}$ in., ellipsoid or ovoid, pale brown,

subterete; rhachilla stout, deeply pitted. Glumes rather laxly imbricate, γ_{c}^{1} in. long, broadly ovate, concave, obtuse, altogether hyaline except a narrow reddish-brown band at the back, obscurely 3-5-nerved, the keel conspicuous. Stamens usually 2. Nut about $\frac{1}{20}$ in. long, very shortly stipitate, turbinate, compressed, biconvex, rounded at the apex, tapering at the base, at first yellow, afterwards black, microscopically rugose; style about $\frac{1}{30}$ in. long, glabrous; stigmas 2, longer than the style. Fl. B. I. v. 6, p. 640; Trim. Fl. Ceyl. v. 5, p. 54; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1151. Fimbristylis glomerata, Nees, in Linnæa, v. 9 (1835) p. 290; Boeck. in Linnæa, v. 37 (1871) p. 47. F. Wightiana, Nees, in Wight, Contrib. (1834) p. 99.— Flowers: Dec.

Sind: Pinwill!; Karachi, Woodrow.—Distrib. India (Orissa, W. Peninsula); Ceylon, Æthiopia, Arabia, China, Malaya.

10. Fimbristylis quinquangularis, Kunth, Enum. v. 2 (1837) p. 229. Annual, glabrous, leafy; root-fibres slender; stems tufted, 6-24 in. long, slender, weak, obtusely angled, deeply striate. Leaves longer or shorter than the stem, very slender, 10 in. broad, linear, finely acuminate, flaccid, with scaberulous margins and keel; sheaths long, subdistictions, green, coriaceous. Umbel decompound, with many suberect filiform much-branched rays bearing innumerable small pedicellate. spikelets (the whole inflorescence appearing like one oblong panicle); bracts filiform, acute, usually shorter than the umbel. Spikelets 1 by in., ellipsoid or ovoid, terete, pale brown, 6-14-flowered; rhachilla winged. Glumes rather laxly imbricate, 1 in. long, broadly ovate, acute, mucronate by the excurrent keel; back 3-nerved; sides hyaline. Stamens 3; anthers obtuse. Nut shortly stipitate, 10 in. long, obovoid, obtusely trigonous, yellow or pale-brown, tuberculate, transversely lineolate, slightly umbonate; style as long as the nut, more or less pubescent, the base not or scarcely dilated; stigmas 3, recurved, longer than the style. Fl. B. I. v. 6, p. 644; Dalz. & Gibs. p. 287; Boeck. in Linnæa, v. 37 (1871) p. 42; Trim. Fl. Ceyl. v. 5, p. 55; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1152.— Flowers: Sept.

KONKAN: Law! GUJARAT: Baroda, Weelrow.—Distrib. More or less throughout India; Ceylon, Malaya, China, Australia.

11. Fimbristylis milincen, Vahl, Enum, v. 2 (1806) p. 287. A glabrous leafy annual; root-fibres slender; stems 6-24 in. long, slender, obtusely angled below, triquetrous above. Leaves shorter than the stem, slender, $\frac{1}{10}$ in. broad or less, tapering to a firm point and with nearly smooth margins; sheaths subdistichous, striate with scarious margins. Umbel decompound; rays unequal, suberect or spreading, filiform, bearing many scattered very small pedicellate spikelets; bracts of subcylindric, obtuse, brown; rhachilla stout, pitted, not winged. Glumes $\frac{1}{20}$ in. long, closely imbricate, ovate, obtuse, cymbiform, membranous, obscurely nerved; keel not excurrent into a nucro. Stamens 1-3; anthers obtuse. Nut $\frac{1}{40}$ in. long, obovoid, obtusely trigonous, minutely stipitate, tuberculate, transversely striolate, yellow; style as long as the nut, glabrous: stigmas 3, about as long as the style. Fl.

B. I. v. 6, p. 644; Dalz. & Gibs. p. 287; Boeck. in Linnen, v. 37 (1871) p. 43; Trim. Fl. Ceyl. v. 5, p. 56; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1152. Scirpus tetragonus, Poir, Encyc. Méthod. v. 6 (1804) p. 767; Grah. Cat. p. 233. Closely allied to F. quinquangularis, but the spikelets are more obtuse, the glumes not mucronate, the rhachilla not winged, and the style glabrous.

KONKAN: Lambert!; Kalyan, Woodrow. Sind: Pinwill ex C. B. Clarks.—Distrib. More or less throughout India; Ceylon, most warm regions.

12. Fimbristylis digitata, Boeck. in Flora, v. 61 (1878) p. 35. A low glabrous plant; root-libres slender; stems 2-5 in. long, cospitose from a bulbous base, slender, subquadrangular, striate; sheaths short, striate, with obliquely truncate mouth. Leaves radical, few, about 1 as long as the stem, bristle-like, linear, acute. Inflorescence in a terminal head, $\frac{1}{8}$ in. in diam., consisting of 3-5 umbellately arranged sessile spikelets; bracts usually 2, subequal, membranous, $\frac{1}{8} - \frac{1}{6}$ in. long, ovate, Spikelets $\frac{1}{8} - \frac{1}{2}$ by $\frac{1}{12} - \frac{1}{8}$ in., erect, closely approximate, acute, striate. ovoid-oblong, subacute, straw-colored, subterete. Glumes 10-18 in. long, ovate, cymbiform, the keel produced into a short mucro, all scarious except the 3-5-nerved back; rhachilla winged. Stamens 3; filaments reaching & in. long; anthers large, 10 in. long, very shortly pyramidally pointed, yellow. Nut 1 in. long, globosely obovoid, trigonous, with rather acute angles, scarcely stipitate, not umbonate, faintly ribbed and trabeculate between the ribs, yellow; style exceptionally long, reaching 10 in., glabrous, with a small conical base; stigmas 3, shorter than the style, exserted. Fl. B. I. v. 6, p. 648; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432. Trichelostylis digitata, Dalz. ex Boeck. in Flora. v. 61 (1878) p. 35.—Flowers: Oct.

Konran: Dalzell!, Stocks, Law!; Marmagão, Talbot, 2506! Deccan: Lanoli, Woodrow. S. M. Country: Badami, Woodrow, 56! Kanara: Law!; Belekerri (N. Kanara), Talbot, 491!—Distrib. India (W. Poniusula).

13. Fimbristylis Woodrowii, C. B. Clarke, in Journ. Linn. Soc. v. 34 (1898) p. 68. A low glabrous slender herb; roots fibrous; stems $1\frac{1}{2}-4\frac{1}{2}$ in. long, exspitose, 5-angled below the umbel. Leaves usually shorter than but occasionally as long as the stem, $\frac{1}{2}0-\frac{1}{12}$ in. broad, acute, flat. Umbel subcompound, $\frac{1}{4}-\frac{5}{6}$ in. in diam., with 8-18 short rays; bracts 2-3, the longest leaf-like, exceeding the umbel. Spikelets varying in length, often geminate, $\frac{1}{6}-\frac{1}{2}$ in. long; rhachilla deeply pitted. Glumes ovate, boat-shaped, spirally arranged, closely imbricate, $\frac{1}{16}-\frac{1}{13}$ in. long, rusty-brown, with a green keel which is produced into a muero. Stamen 1. Nut $\frac{1}{30}$ in. long, narrowly obovoid, trigonous, straw-colored or white, stipitate, not umbonate, faintly longitudinally ribbed and trabeculate between the ribs; style $\frac{1}{25}$ in. long with a bulbous base, glabrous; stigmas 3, about as long as the style. Woodrin Journ. Bomb. Nat. v. 13 (1901) p. 431.—Flowers: Oct.

Konkan: Malwan, Woodrow! Deccan: Khandala, Woodrow!—Distrib. India (W. Peninsula).

Mr. Clarke originally described the plant from undergrown specimens from Khandala, the spikelets of which did not exceed 1 in. long. Specimens collected more recently at Malwan show that the spikelets reach \(\frac{1}{2} \) in. long.

14. Fimbristylis monostachya, Hassk. Pl. Jav. Rar. (1848) p. 61. Densely tufted and leafy; root-fibres slender. Stems 6-12 in. long, very slender or filiform, strinte. Leaves crowded on the swollen base of the stem, filiform or nearly so, about & as long as the stem. acute or acuminate; sheaths short, with scarious margins. Spikelets solitary (rarely 2) on the stem, variable in size, \(\frac{1}{2} - \frac{1}{2}\) by \(\frac{1}{2} - \frac{1}{2}\) in., compressed, orate, acute, shining, pale straw-colored, the 2 lower glumes empty and longer than the others, cuspidate; rhachilla slender with persistent wings. Glumes loosely imbricate, subdistichous, muchkeeled, ovate, acute, cuspidate, coriaceous. Stamens 3; anthers 1, in. long, subacute, yellow. Nut $\frac{1}{10}$ in. long with a long stalk, globosely pyriform, narrowed into the stout stipes, trigonous with rather acute angles, tuberculate on the 3 faces, with a short pyramidal apex, strawcolored, glabrous; style & in. long, stout, pubescent all over and on the conical base; stigmas 3, much shorter than the style. Fl. B. I. v. 6, p. 649; Trim. Fl. Ceyl. v. 5, p. 59; Woodr, in Journ. Bomb. Nnt.
 v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1150. Abildyaardia monostachya, Vahl, Enum. v. 2 (1806) p. 296; Dalz. & Gibs. p. 286; Boeck. in Linnea, v. 37 (1871) p. 53 .- Flowers: July.

DECCAN: Poons, Jacquemont, 411! S. M. COUNTRY: Badami, Woodrow.—Distrin. Throughout the warmer parts of India; Ceylon, most warm countries.

15. Fimbristylis monticola, Hochst. ex Steud. Syn. Pl. Cap. (1855) p. 111. A very slender plant; root-fibres filiform; stems 3-12 in. or more long, filiform, obtusely trigonous, striate, flexuous. Leaves many at the base of the stem, shorter than or sometimes nearly equalling the stem, filiform, acute, with distantly scabrid margins; sheaths short, membranous. Umbel subsimple or subcompound; rays 2-4 with 1 or 2 spikelets on each, $\frac{1}{4}$ - $\frac{1}{2}$ in. long, filiform, spreading or recurved; bracts very short, setiform. Spikelets 4-3 in. long, elliptic-oblong, obtuse or acute, compressed, dark-brown; lowest glumes very small, deciduous; rhachilla with deep pits with hyaline margins. Glumes laxly subdistichously imbricate, in long, triangularly ovate, apiculate, concave, coriaceous, with hyaline margins; back 3-nerved; keel conspicuous. Stamens 3; anthers with an acute tip. Nut stipitate, in. long, globosely obovoid, obtusely trigonous, minutely tuberculate, yellow or brown; style 15 in. long, with bulbous base, more or less pubescent all over; stigmas 3, as long as the style. Fl. B. I. v. 6, p. 642; Trim. Fl. Ceyl. v. 5, p. 60; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431.—Flowers: Aug.

Korkan: Shelarvadi (Bhore Ghát), Woodrow, 10!—Distain. India (W. Peninsula); Ceylon.

16. Fimbristylis complanata, Link, Hort. Berol. v. 1 (1827) p. 292. Glabrous; rhizome very short, hard, creeping; root-fibres wiry; stems 8-24 in. long, much flattened near the top, 2-edged. \(\frac{1}{6}\) in. broad, deeply grooved and ribbed, quite smooth. Leaves crowded at the base of the stem and shorter than it, 3-8 by \(\frac{1}{6}\)-\(\frac{1}{4}\) in., coriaceous, flat, linear, suddenly narrowed at the tip, obtuse or subacute, with scaberulous margins; sheaths coriaceous with scarious margins. Umbels decompound, effuse, 1-3 in. broad, with few or many flattened rays, loosely corymbosely branched, the branches bearing small shortly pedicellate

brown spikelets; bracts ½ as long as the umbel, the largest leaf-like, erect, the others subulate. Spikelets ½ by ½ 10 10 in., ovoid-oblong, few-flowered, brown, with more or less distichously arranged glumes, the lowest glume empty. Glumes ½ in.long, ovate, the keel prolonged into a long mucro; sides brown, the margins not hyaline; keel deep, acute. Stamens 3; anthers long, obtuse. Nut ½ in.long, obovoid, stipitate, obtusely trigonous, pale straw-colored or nearly white, slightly umbonate, minutely warted; style longer than the nut with a conical base, slender, glabrons; stigmas 3, long. Fl. B. I. v. 6, p. 646; Trim. Fl. Ceyl. v. 5, p. 63; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1152. Scirpus complanatus, Retz. Obs. fasc. 5 (1789) p. 14; Grah. Cat. p. 233.

Deccan: near Chattersinghi (Poona districts), Ranade! Sinn: Pinwill!—Distrib. India (Mussooree, Saharanpur, Assam, Birma, W. Peninsula); Ceylon, Indo-Ohina, Africa, Oceania.

VAR. microcarya, C. B. Clarke, in Hook. f. Fl. B. I. v. 6 (1893) p. 646 (by misprint microcarpa, an error which Mr. Clarke has corrected on the sheets in Herb. Kew.). Stems slender, hardly flattened under the umbel. Spikelets more slender. Nut very small, velate (i. c., the outermost cells withering and peeling off). Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431. Fimbristylis microcarya (sp.), F. Muell. Fragm. Phyt. Austral. v. 1 (1858-59) p. 200; Benth. Fl. Austral. v. 7 (1878) p. 316.

Drccan: water-holes at Hewra, Dalzell!; Poona, Woodrow.

17. Fimbristylis junciformis, Kunth, Enum. v. 2 (1837) p. 239. Glabrous; rhizome woody, short or creeping; root-fibres stout, wiry; stems 4-18 in. long, tuited, rigid, 4-5-angled or compressed above, deeply striate. Leaves crowded round the base of the stems and very much shorter than them, $\frac{1}{12} = \frac{1}{6}$ in broad, spreading and recurved, flat, coriaceous, with a triangular acute tip and scaberulous margins; sheaths short, coriaceous. Umbel compound, with few slender rays 1-3 in. long, bearing distant or clustered small chestnut-brown spikelets; bracts 2-4, much shorter than the umbel, erect, rigid, acute. Spikelets $\frac{1}{h}$ by $\frac{1}{10}$ in., the 2 lowest glumes distichous, the lowest empty; rhachilla stout, with caducous wings. Glumes 10 in. long, ovate, shortly mucronate, with slender keel and pale hyaline margins. Stamens 3; anthers long, acuminate. Nut $\frac{1}{20}$ in. long, very shortly stipitate, obovoid, trigonous, obscurely ribbed and with faint vein-like markings, pale straw-colored or nearly white, minutely umbounte; style $\frac{1}{\sqrt{n}}$ in long with conical base, pubescent above; stigmas 3, about as long as the style. Fl. B. I. v. 6, p. 647; Boeck. in Linnea, v. 37 (1871) p. 49; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1152.—Flowers: Nov.

DECEAN: Karli, Woodrow. SIND: Pinwill!—DISTRIB. Throughout India; Ceylon, Madagascar, Philippines.

5. STENOPHYLLUS, Rafin.

Annual herbs; stems slender, leafy at the base only. Leaves very narrow, filiform or capillary. Spikelets small, crowded in a terminal head or umbellate; bracts short. Glumes few or many, imbricate all

round the rhachilla, 1-2 lowest and often the uppermost empty: hypogynous bristles 0. Stamens 1-3: anthers linear, obtuse or apiculate. Ovary obovoid; style slender, glabrous; stigmas 3. Fruit an obovoid obtuse trigonous smooth nut, crowned by the persistent style-base .--Distrib. Species about 70, in most warm regions.

The name Stenophyllus [Raf. Neog. (1825) p. 4] is prior to the name Bulbostylis, Kunth (1837), as pointed out by Dr. N. L. Britton in "The Sedges of Jamaica," published in the Bulletin of the Jamaica

Department of Agriculture, v. 5, Suppl. 1, p. 1.

- 1. Stenophyllus barbata (Scirpus), Rottb. Descrip. et Icon. (1773) p. 52. A slender annual 3-12 in. high; stems tufted, filiform, glabrous, strinte. Leaves about & as long as the stem, capillary, acuminate, the margins involute, scaberulous upwards; sheaths short, membranous, with bearded mouths. Spikelets 1-1 in. long, few-flowered, oblonglanceolate, reddish-brown, crowded in a terminal head 1-1 in. in diam.; bracts shorter than or rarely exceeding the spikelets; rhachilla stout. Glumes 1 in. long, ovate, laterally compressed, boat-shaped, loosely imbricate, acute or with the stout acute keel ending in a mucro. Stamen 1; anther linear, subacute. Nut I in. long, globosely obovoid, trigonous with prominent angles, crowned with the minute base of the style, smooth, pale straw-colored; style slender; stigmas 3. stylis barbata, Kunth, Enum. v. 2 (1837) p. 208; C. B. Clarke, in Hook, f. Fl. B. I. v. 6, p. 651; Trim. Fl. Ceyl. v. 5, p. 66; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1156. Scirpus barbatus, Rotth. Descrip. et Icon. (1773) p. 52, t. 17, fig. 4; Boeck, in Linnea, v. 36 (1870) p. 751.—Flowers: July.
- S. M. Countay: Badami, Woodrow. Sind: Pinwill!-Distrib. Throughout India; Ceylon, warm regions.

6. ELEOCHARIS, R. Br.

Glabrous herbs; stems tufted, simple, erect, embraced by one or more membranous truncate sheaths. Leaves obsolete, or, rarely, a herbaceous or membranous limb on the sheath. Inflorescence a single solitary ovoid or cylindric many-flowered spikelet. Glumes imbricate round the rhachilla, membranous or coriaceous, the lowest usually empty, bract-like, but not longer than the spikelet; the uppermost empty, the remainder 2-sexual; hypogynous bristles 8 or fewer, rarely absent, retrorsely scabrous or spinulose. Stamens 3-1; anthers linear or linear-oblong, crested, muticous, or with an acicular tip. Ovary orbicular-ovoid; style with a swollen base; stigmas 2-3, filiform or flattened. Fruit a plano-convex or trigonous nut, crowned by the persistent and swollen, pyriform conical or depressed style-base,-DISTRIB. Cosmopolitan; species 113.

Glumes subrigid, smooth or striate, but keeled, concolorous; stems usually stout; stigmas 2-3.

Nut smooth; stems terete, transversely septate when dry. Nut longitudinally striate; stems subtriquetrous below

the spikelet, not septate. Spikelets neute; glumes orate, subscute

2. E. fietulesa.

1. E. plantaginez.

Spikelets obtuse; glumes quadrate, rounded or sub-

3. E. spirelia.

Glumes membranous, usually 1-3-nerved, with a green keel stems usually slonder.

Stigmas 2; nut compressed.

Roots fibrous; rhizome short or 0.

1. Eleocharis plantaginea, R. Br., Prod. (1810) p. 224 (in note). Stolons long, $\frac{1}{5}$ in. in diam.; stems 1-3 ft. high, $\frac{1}{5}$ in. in diam., densely tufted, appearing transversely septate when dry; sheaths 2-8 in. long, very thin, soon torn, bright red-brown, shining. Spikelets 3-13 in. long, straw-colored, rather narrower than the stem; rhachilla stout, angled, with irregular broad concave facets between the insertion of the glumes. Glumes closely imbricate, & in. long, subrigid, concolorous, not keeled, broadly ovate, obtuse, rarely truncate, I-nerved, coriaceous, persistent, the lowest very stout, appearing as a continuation of the stem. Bristles 7, equalling or exceeding the nut, retrorsely scabrid, yellow. Stamens 3; anthers narrowly linear, with a long setuceous tip. Nut 1 in. long, orbicular-obovoid, compressed, smooth. yellowish; style long, flattened, with a triangular base; stigmas 3. Fl. B. I. v. 6, p. 625; Trim. Fl. Ceyl. v. 5, p. 68; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1148. Scirpus plantuginus, Roxb. Fl. Ind. v. I (1832) p. 212; Grah. Cat. p. 233. Scirpus nlantaginoides. Rottb. Descrip. et Icon. (1773) p. 45, t. 15, fig. 2. Heleocharis plantaginea, Boeck, in Linnea, v. 36 (1870) p. 474.-Flowers: Sept.

KONKAN: Bombay without locality or authority in Herb. Kew.! Gujarat: Baroda, Woodrow. Sind: Pinwill!—Distrib. India (N.-West, Assam, W. Peninsula); Ceylon, Malay Peninsula, Tropies of the Old World.

2. Eleocharis fistulosa, Link, in Spreng. Jahrb. Gewäch. (1820) Heft 3, p. 78. Stems robust or slender, 1-3 ft. by 1-1 in., stoloniferous, triquetrous under the spikelet, concave on one face, not transversely septate; sheaths obliquely truncate, thinly membranous, loose, ending in an ovate, acute or lanceolate hyaline limb. Spikelets 3-11 in. long, as broad as the stem or broader, greenish; lowest glumes bractiform, broadly oyate, coriaceous, with narrow membranous margins; rhachilla slender, angular, with broad concave facets between the Fertile glumes nearly 1 in. long, ovate-oblong or subobovate, multistriate on the back outside, often with minute brown spots inside; bristles longer than the nut, brown, retrorsely scabrid. Nut I in. long, obovoid, striate, pale, tipped with the annular somewhat saucershaped style-base, which is about three-fourths the width of the nut; stigmas usually 3. Fl. B. I. v. 6, p. 626; Trim. Fl. Ceyl. v. 5, p. 70; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1148. Heleocharis fistulosa, Boeck, in Linna, v. 36 (1870) p. 472.

KANARA: Talbot, 1040, ex C. B. Clarke, in Journ. Linn. Soc. v. 34 (1898-1900) p. 48.

I have seen no specimens from the Bombay Presidency; there are none in Herb. Kew.—Distrib. India (Nipal, Assam, Birma, W. Peninsula); Tropics generally.

3. Eleocharis spiralis, R. Br. Prodr. (1810) p. 224 (in note). Stems densely tufted, stoloniferous, 1-2 ft. by $\frac{1}{8}$ - $\frac{1}{6}$ in., trigonous or

biconvex below, triquetrous above; upper sheath with a broad ovateoblong appressed limb sometimes reaching 1 in. long. Spikelets 1-1 in. long, thicker than the stem, cylindric, obtuse, pale; lowest glume like the others but more coriaceous; rhachilla stout, terete, deeply regularly pitted. Glumes very many, closely spirally imbricate, ½ in. long and as broad as long, quadrate, rounded at the apex, with a hyaline border on the sides and on the top; back thick, pale (nearly white) outside, dotted with brown spots inside; bristles much shorter than the nut, scabrid. Stamens 1 in. long; anthers narrow. Nut 1 in. long (not including the conical whitish style-base, which reaches to about 30 in. long and which is as broad as 2 of the nut), ashy brown, globosely obovoid, biconvex, shining, with thickened margins, faintly striate and with minute transverse yellowish streaks; style with the style-base as long as the nut; stigmas 2 or 3. Fl. B. I. v. 6, p. 627; Trim. Fl. Ceyl. v. 5, p. 70; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1148. Scirpus spiralis, Rottb. Descrip. et Icon. (1773) p. 45, t. 15, fig. 1.-Flowers: Dec.

Konkan: Salsette, Jacquemont, 7251; Goa, Lisboa, 45!—Distriin. India (Bengal, Birma, W. Peninsula); Ceylon.

4. Eleocharis atropurpurea, Kunth, Enum. v. 2 (1837) p. 151. Annual; roots fibrous; stems slender, densely tufted, 2-7 in. long, straight or curved. Leaves 0; sheaths short. Spikelets \(\frac{1}{2}\)-\frac{1}{4}\) in. long, ovoid, obtuse or subacute, much broader than the stem, many-flowered; rhachilla pitted. Glumes \(\frac{1}{6}\)-\frac{1}{2}\) in. long, broadly ovate-oblong, obtuse, concave, loosely imbricate, easily detached; back green; sides membranous with a chestnut-brown band along each; bristles 4-7, slender, scabrid, as long as the nut, white. Anthers small, apiculate. Nut \(\frac{1}{2}\)-\frac{1}{2}\) in. long, obvoid, biconvex, smooth, black, apiculate with the short stout white style-base; stigmas 2. Fl. B. I. v. 6, p. 627; Trim. Fl. Ceyl. v. 5, p. 71; Woodr. in Jeurn. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1148. Heleocharis atropurpurea, Boeck. in Linn. v. 36 (1870) p. 458.—Flowers: Sept.

GUJARAT: Godra, Woodrow! Sixt: Perwill!—Distrib. India (W. Himalaya, Assam, W. Peniusula); Ceylon, Tropics generally.

5. Eleocharis capitata, R. Br. Prod. (1810) p. 225. Annual; root fibrous; stems densely tufted, numerous, 2-10 in. long, slender, trigonous. Leaves 0; sheaths short, sometimes tinged with purple, the mouth oblique, acute. Spikelets $\frac{1}{10} - \frac{1}{10}$ in. in diam., globosely ovoid, rounded at the apex, pale. Lowest glumes bractiform, $\frac{1}{20}$ in. long, ovate-oblong, obtuse; fertile glumes $\frac{1}{10}$ in. long, orbicular-ovate, obtuse, imbricate, easily detached, concave; rhachilla terete, pitted; bristles longer than the nut, 7 or fewer, pale rose-brown when ripe (Clarke), retrorsely scabrid. Anthers small, linear, obtuse. Nut $\frac{1}{30}$ in. long, globosely obovoid, brown, smooth, shining, apiculate with the broad style-base; style short; stigmas 2. Fl. B. I. v. 6, p. 627; Dalz. & Gibs. p. 285; Trim. Fl. Ceyl. v. 5, p. 72; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. p. 1148. Heleocharis capitata, Boeck, in Linnæa, v. 36 (1870) p. 461.—Flowers: Sept.

DECCAN: Poona, Weshate, Kanara; Thomson, Sish: Dalzell!; Jemadar ka Landa near Karachi, Stocks!—Distrin, India (Behar, Bengal, W. Peninsula); Ceylon, Singapore, most warm countries.

6. Eleocharis palustris, R. Br. Prod. (1810) p. 224 (in note). A variable plant; rhizome creeping, black or chestnut-brown, rooting from the nodes; stems 4-24 by $\frac{1}{25}$ - $\frac{1}{8}$ in.; upper sheath truncate or sometimes produced at one side into a small triangular limb. Spikelets 1-1 by 1-1 in., ellipsoid or cylindric, chestnut-brown or straw-colored. subacute, the lowest glume bract-like, empty, suborbicular, smaller than the fertile ones, coriaceous, with hyaline margins, about 4-surrounding the stem; bristles usually 4, longer than the nut, scabrid, brown. Fertile glumes \(\frac{1}{2} - \frac{1}{6}\) in. long, thinly membranous, either hyaline except the back which is narrow and green, ovate-lanceolate, obtuse or subacute; or elliptic, acute, with the back and sides chestnut-brown and with hyaline margins. Stamens 3. Nut 15 in. long (not including the large oblong-conic obtuse subcompressed pale or brown-dotted stylebase which reaches sometimes 1 in. long), globosely obovoid, smooth, biconvex, bright yellow or pale brown, the margins scarcely thickened; style above the conical base 10 in. long; stigmas 2 (very rarely 3), about as long as the style. Fl. B. I. v. 6, p. 628; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain, Beng. Pl. 1148. Heleocharis palustris, Lindl. Syn. Brit. Fl. (1829) p. 280; Boeck. in Linnen, v. 36 (1870) p. 466.

Sind: Hyderabad, Woodrow.-Distrib. Cosmopolitan except Australia.

- 7. Eleocharis Chætaria, Ræm. & Schult. Syst. v. 2 (1817) p. 154. Glabrous; roots fibrous, rarely with a white filiform rhizome 1 in. long; stems 1-8 in. long, densely tufted, filiform or capillary; straight or curved; sheaths short, membranous. Spikelets \(\frac{1}{5} - \frac{1}{6}\) in. long, ovoid, obtuse, usually tinged with red, terete or compressed, with 1-4 nuts, the lowest glume boat-shaped, empty, 1 in. long, with green obscurely 3-nerved back and broad hyaline margins; rhachilla narrowly winged; bristles 6 or fewer, rather longer than the nut, pale-brown, scabrid, sometimes wanting. Glumes 6-8, subdistichous, loosely imbricate, reaching & in. long, boat-shaped, with narrow green backs and chestnutbrown sides and with hyaline margins. Anthers linear, 1 in. long. Nut obovoid, trigonous, $\frac{1}{20}$ in. long (not including the acutely pyramidal style-base, which is less than $\frac{1}{60}$ in. long and nearly as broad as the nut), cancellate, the angles smooth produced into short prominences or shoulders below the convex top, dull pale-straw-colored; style short; stigmas 3, very long. Fl. B. I. v. 6, p. 629; Trim. Fl. Coyl. v. 5, p. 71; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 431; Prain. Beng, Pl. p. 1148. Heleocharis Chataria, Boeck, in Linnaa, v. 36 (1870) p. 428.
- S. M. Country: Londa, Woodrow; Dharwar, Woodrow.—Distrib. More or less throughout India; Ceylon, Malacca, Tropics generally.

7. SCIRPUS, Linu.

Glabrous often tail herbs, leafless or leafy at the base only (very rarely leafy all along the stem); stems terete, trigonous or triquetrous. Inflorescence*terminal or lateral, of clusters or umbels of oblong or ovoid many-flowered sessile or pedicellate spikelets. Glumes spirally imbricating round a stout or slender rhachilla, the lowest 2 and a few of the uppermost empty; hypogynous bristles 0 or 2-7, retrorsely

scabrid or rarely (S. literalis and S. Kysoor) plumose. Stamens 1-3; anthers linear. Ovary obovoid; style slender, the base dilated; stigmas 2-3, slender. Nut obovoid, trigonous or biconvex, smooth or nearly so; the style leaving no button on the nut.—Distrib. Species about 136, spread throughout the world.

Large or middle-sized herbs; stems I-6 ft. or more long,	
· leafy only near the base, rush-like; hypogynous bristles	
present or not.	
Nut marked with transverse wavy lines; hypogynous	
hristles 0.	
Stems flowering nearer to the base than the top,	
stout, terete, spongy; glumes lin. long, with a subcordate base, not inflated in front, hardly	
subcordate base, not inuated in front, initially	
keeled	I. S. articulatus.
Stems flowering nearer to the top than the base,	
slender, obtusely trigonous; glumes 1'a in. long,	
with tapering (not subcordate) base, not inflated	0. 6
in front, strongly keeled	2. S. supinus.
Stems flowering nearer to the top than the base,	
slender, subcompressed; glumes often 5-ranked, 1 in. long, with tapering (not subcordate) base,	
inflated in front, keeled	3. S. guingvefarms,
Nut not marked with transverse wavy lines.	5. B. quinque jaries,
Hypogynous bristles 0	A S commissions
Hypogynous bristles present.	3. O. Corgressus.
Hypogynous bristles retrorsely scabrid (not plu-	
mose).	
Glumes 2-fid at the apex	5. S. maritimus.
Glumes not 2-fid at the apex	
Hypogynous bristles plumose.	
Inflorescence lateral; nut plano-convex	7. S. litoralis.
Inflorescence terminal; nut oboroid	8. S. Kysner.
Small tufted herbs with slender stems never reaching 1 ft.	· ·
long; hypogynous bristles 0.	
Perennial herb	9. S. Kyllingioides.
Annual herba.	
Glumes elliptic; mucro # the length of the blade;	
bracts many, reaching 31 in. long	S. Michelianus,
Glumes trapeziform; cusp as long as the blade;	
bracts 1-3, reaching 1 in. long	11. S. squarresus.

1. Scirpus articulatus, Linn. Sp. Pl. (1753) p. 47. A glabrous perennial (?) herb; stems 1-3 ft. long, densely tuited, as thick as the little finger, spongy and transversely septate within (visible externally), terete, striate, flowering nearer the base than the top. Leaves 0, or the sheaths with a membranous acute tip sometimes 1 in. long. Spikelets variable in length, \(\frac{1}{4}\rightarrow\frac{1}{4}\) in. long, ovoid-oblong, acute, terete or obscurely angular, rusty-brown, sessile in laterally stellately spreading clusters of 15-60; bracts 0. Glumes \(\frac{1}{2}\) in. long and nearly as broad, broadly ovate, acute, very shortly mucronate, closely imbricate, membranous, concave, persistent, scarcely keeled, with a subcordate base and hyaline margins. Stamens 3, reaching \(\frac{1}{2}\) in. long; anthers linear, obtuse, \(\frac{1}{20}\) in. long, yellow. Nut \(\frac{1}{2}\) in. long, obovoid, sharply triquetrous, black, opaque, shortly pointed, striate with transverse wavy lines; style \(\frac{1}{2}\) in. long; stigmas 3, nearly as long as the style. Fl. B. I. v. 6, p. 656; Grab. Cat. p. 233; Boeck, in Linnara, v. 36 (1870) p. 702; Trim. Fl. Ceyl. v. 5, p. 75; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain,

Beng. Pl. p. 1159. Isolepis articulata, Nees, in Wight, Contrib, (1834) p. 108; Dalz. & Gibs. p. 286.—Flowers: Oct.-Feb.

Konkan: Woodrow. Gujarat: Dakor, Kanitkar! Sind: Pinwill!—Distrib. Throughout India; Ceylon, Africa, Philippines, Australia.

2. Scirpus supinus, Linn. Sp. Pl. (1753) p. 49. A glabrous annual; roots fibrous; stems densely tufted, 6-15 in. long, slender, obtusely trigonous, striate, flowering above the middle. Leaves very short or 0; sheaths short or long, the mouth oblique, rarely produced into a very short erect acute limb. Spikelets 3-8 in a cluster, coming off from 2 to 6 in. below the top of the stem, \(\frac{1}{16}\)-\frac{1}{4} in. long, ellipsoid or oblong, green, sessile or nearly so, obscurely angular by reason of the sharp keels of the glumes; rhachilla slender, not winged. Glumes \(\frac{1}{16}\) in. long, ovate, acute, membranous, closely imbricate, strongly keeled, the keel produced into a short mucro; hypogynous bristles 0. Nut \(\frac{1}{16}\) in. long, globosely obovoid, rugose with transverse wavy lines, trigonous, umbonate, black; style \(\frac{3}{16}\) in. long; stigmas 3, nearly as long as the style. Fl. B. I. v. 6, p. 655; Boeck. in Linnæa, v. 36 (1870) p. 699; Trim. Fl. Ceyl. v. 5, p. 74; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1159.—Flowers: Oct.-Feb.

KONKAN: Law!; Kalyan, Woodrow; Bansda, Woodrow. Gujarat: Dakor, Kanitkar! Sind: Pinwill!—Distrib. More or less throughout India; Coylon, Old World generally and in America.

Var. uninodis, C. B. Clarke, in Hook. f. Fl. B. I. v. 6 (1893) p. 656. Inflorescence of 1-4 heads in a contracted umbel, the rays rarely reaching 1 in. long. Prain, Beng. Pl. p. 1159. Isolepis uninodis (sp.), Delile, Fl. Egypte, p. 8, t. 6, fig. 1. Scirpus mucronatus, Roxb. Fl. Ind. v. 1 (1832) p. 216 (not of Linn.).

Sind: Pinwill!

3. Scirpus quinquefarius, Ham. in Wall. Cat. (1828) 3465. Root fibrous; stems 3-25 in. long, slender, terete or slightly compressed, often when dry transversely septate; sheaths with an obliquely truncate mouth. Leaves almost 0. Spikelets 1-9 in a single lateral dense head, usually nearer to the top than the base of the stem, $\frac{3}{4}$ by $\frac{1}{4}$ in., ovoid-oblong, obtuse, slightly compressed, pale-brown, shining. Glumes inflated in fruit, $\frac{1}{6}$ in. long, usually 5-ranked, elliptic-lanceolate, membranous, multistriate, acutely mucronate, the apex slightly recurved, keeled, tapering (not cordate) at the base; hypogynous bristles 0. Stamens 3, reaching $\frac{1}{6}$ in. long; anthers linear, objuse. Nut $\frac{1}{16}$ in. long, obovoid, acutely trigonous, apiculate, rugose with transverse wavy lines, black; style $\frac{1}{16}$ in. long; stigmas 3, shorter than the style. Fl. B. I. v. 6, p. 657; Boeck. in Linnæa, v. 36 (1870) p. 701; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1159.—Flowers: Nov.-Dec.

4. Scirpus corymbosus, Heyne, ex Roth, Nov. Pl. Sp. (1821) p. 28. Glabrous; rhizome 2-4 in. long, horizontal; stems approximate, reaching 3 ft. long, stout, terete, finely striate; sheaths few, near the base, with

an obliquely subacute mouth. Leaves 0. Inflorescence lateral, from near the top of the stem, which is produced bract-like above it into an acute stiff point. Spikelets in pedunculate clusters $\frac{1}{4} - \frac{3}{5}$ in. long, ellipsoid, reddish-brown. Glumes $\frac{1}{6}$ in. long, broadly ovate, acute, pale-brown with darker streaks, strongly keeled, the keel produced into a short erect mucro; hypogynous bristles 0. Stamens 3, reaching $\frac{1}{6}$ in. long; anthers $\frac{1}{36}$ in. long, linear, obtuse, yellow. Nut $\frac{1}{12}$ in. long, obvooid, trigonous, with a somewhat pyramidal apex, smooth, not rugose with transverse wavy lines, yellow; style reddish, $\frac{1}{16}$ in. long; stigmas as long as the style. Fl. B. I. v. 6, p. 657; Boeck. in Linnea, v. 36 (1870) p. 706; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432.— Flowers: Dec.

KONKAN: Gon, Woodrow. Sind: Pinwill!, Woodrow.—Distrin. India (Bandelland, W. Peninsula); Africa, Madagascar.

5. Scirpus maritimus, Linn. Sp. Pl. (1753) p. 51. Glabrous: rhizome creeping, bearing tubers; stems 1-3 ft. long, stout, triquetrous. Leaves grass-like, harsh, numerous, often as long as the stem, 1-1 in. broad, keeled; sheaths long. Inflorescence terminal or subterminal, umbellate with rays of unequal length; bracts 3-5, leaf-like, the longest much exceeding the inflorescence, keeled, finely pointed. Spikelets 3-8 or solitary on each ray (or umbel rarely reduced to a head of 3-1 spikelets), 3-1 in. long and often 1 in. in diam., ovate-oblong or cylindric, reddish-brown. Glumes 4 in. long, broadly ovate, strongly keeled, membranous, glabrous or puberulous, brown or golden-brown, bifid at the apex and with a long subrecurved mucro about no in. long formed by the production of the keel between the apical lobes; hypogynous bristles 3-6, unequal, 10 10 in. long, shorter than the nut, slender, retrorsely scabrid. Stamens 3, reaching 1 in. long. Nut 1 in. long, obovoid, obtusely trigonous, umbonate, quite smooth, pale yellow, nearly white; style $\frac{1}{6} - \frac{1}{5}$ in. long; stigmas 3, as long as the style. Fl. B. 1. v. 6, p. 658; Dalz. & Gibs. p. 288; Boeck. in Linna, v. 36 (1870) p. 722; Watt, Dict. Econ. Prod. v. 6, part 2, p. 491. Scirpus tridentatus, Roxb. Hort. Beng. (1814) p. 81; Fl. Ind. v. 1 (1832) p. 225; Grah. Cat. p. 233.—Flowers: Nov.

Konean: Bombay, Woodrow. Deccan: Miraj, Woodrow. Gejarat: Umrat, Woodrow! Sind: Dalzell!, Stocks, 1094!; Karachi, Woodrow.—Distrib. India (Kashmir, Kashgar, Moradabad, W. Peninsula); Old World with vars. in Australia and America.

Var. affinis, C. B. Clarke, in Hook. f. Fl. B. I. v. 6 (1893) p. 659. Spikelets capitate, usually 3-1, large, ovoid-lanceolate; glumes straw-colored, sparingly hairy; hypogynous bristles 4, as long as the nut; nut small; stigmas 2. Prain, Beng. Pl. p. 1159. Scirpus affinis (sp.), Roth, Nov. Pl. Sp. (1821) p. 30; Nees, in Wight, Contrib. (1834) p. 111.

Konkan: Bombay, Law! Decean: Nasik, Cooke! Sind: Dalzell!

6. Scirpus grossus, Linn. f. Suppl. (1781) p. 104. Rootstock stout, stoloniferous or not; root-fibres thick; stem 6-10 ft. high, as thick as the little finger, triquetrous, spongy, with concave sides and smooth angles. Leaves few, radical, 2-3 ft. by ½ in., much keeled,

finely acuminate, coriaceous, with smooth or scaberulous margins; sheaths Spikelets subglobosely ovoid, 1-3 in. long, dark-brown, in long, open. large corymbiform decompound terminal open or contracted umbels 3-8 in. in diam., solitary on the top of rigid erect or spreading rays of various lengths; involucral bracts 3, leaf-like, the longest up to 3 ft. long by 1-1 in. broad at the base, flat, linear, acuminate; bracts of the secondary and tertiary umbels lauceolate, acute, scarious, 1-1 in. long. Glumes rather loosely imbricate, $\frac{1}{6} - \frac{1}{6}$ in. long, elliptic, obtuse, mucronate, keeled, membranous; hypogynous bristles 6, unequal, longer than the nut, retrorsely scabrid (not plumose), brown. Stamens 3, reaching 1 in. long; anthers linear, large. Nut In in. long, obovoid, trigonous, with a minute conical tip (style-base), ashy-grey or yellowish, smooth; style In in. long, with dilated base; stigmas 3, as long as the style. Fl. B. I. v. 6, p. 659; Boeck. in Linna, v. 36 (1870) p. 723; Trim. Fl. Cevl. v. 5. p. 77; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1159.—Flowers: Sept.

Konkan: Kulyan, Woodrow. Dregan: Poona, Cooke! Sinn: Pinwill!— Distrib. More or less throughout India; Caylon, Malaya, Tonkin, Philippines.

7. Scirpus litoralis, Schrad. Fl. Germ. v. 1 (1806) p. 142, t. 5, fig. 7. Rootstock stout, hard, with matted fibrillose root-fibres; stem 2-31 ft. long, as thick as the thumb at the soft base, and as a crow-quill near the top, terete below, trigonous above, spongy, striate, smooth. Leaves 6-24 by $\frac{1}{10}$ $\frac{1}{4}$ in., membranous, grass-like, finely acuminate; sheaths long, soft, open. Inflorescence near the top of the stem, which is produced 1-6 in beyond the umbel. Spikelets pale brown, 1-1 in. long, oblong, obtuse, terete, pedicellate, in lax subcorymbose or paniculate umbels with drooping rays 1-2 in. long. Glumes & in. long, membranous, ovate-oblong, obtuse, notched at the top, mucronate in the notch by the excurrent slender green keel; hypogynous bristles 2-7, longer than the nut, unequal, linear, plumoso with moniliform hairs. Stamens 2 or 3, reaching $\frac{1}{6}$ in. long; filaments broad; anthers slender, tipped with a red appendage. Nut $\frac{1}{16}$ in. long and broad, orbicularly obovoid, plano-convex, smooth, with a long apiculation, dull-brown; style 1 in. long; stigmas 2, as long as the style. Fl. B. I. v. 6, p. 659; Trim. Fl. Ceyl. v. 5, p. 77; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1159. Scirpus subulatus, Dalz. & Gibs. Bo. Fl. (1861) p. 288 (not of Vahl).

Sind: Dalzell! Gujarat: Ahmedabad, Burkhill ex Drummond; Kathiawar, Mehta ex Drummond; Rajhote, Cooke!—Distric. India (Panjáh, Central India, W. Peninsula); Ceylon, Persia, Central Asia, Africa, Mediterranean regions.

Mr. Drummond in a paper in the Journal of the Asiatic Society Bengal (v. 73,

Mr. Drummond in a paper in the Journal of the Asiatic Society Bengal' (v. 73, part 2 (1904) p 137) shows that S. subulatus, Valu, which in the 'Flora of British India' (l. c.) has been made synonymous with S. literalis should be considered distinct from that species in consequence of its having a trifid style.

8. Scirpus Kysoor, Roxb. Hort. Beng. (1814) p. 6; Fl. Ind. v. 1- (1832) p. 230. Rootstock stoloniferous, the stolons often producing hard globose tubers $\frac{1}{2}-\frac{3}{4}$ in. in diam., densely clothed with matted fibres; stems straight, erect, 4-6 ft. high, triquetrous, with sharp often retrorsely hispid angles. Leaves several to each stem and about as long as the stem, $\frac{1}{2}-\frac{3}{4}$ in. wide, linear, acuminate, the margins and keel somewhat hispid when young. Umbel terminal, supra-decompound, very

similar to that of Scirpus grossus; bracts 3, very unequal, the longest often 2 ft. or more long, the shortest 2-3 in., leaf-like. Spikelets 1-1 in. long, subglobosely ovoid, brown. Glumes & in. long, broadly ovate or suborbicular, membranous, reddish-brown, with a strong keel in the upper part produced into a straight or slightly recurved mucro about $\frac{1}{4y}$ in, long. Stamens 3, reaching $\frac{1}{5}$ in, long; hypogynous bristles 5, plumose with many minute multicellular hairs. Nut 7 in. long, obovoid, trigonous, with pyramidal apex, smooth, yellow; style to in. long with dilated red base; stigmas 3, as long as or longer than the style.

Mr. Clarke, in Hook. f. Fl. B. I. (l. c.), gives the number of hypogynous bristles as 6. Roxburgh (l. c.) says 5, and I have invariably found 5 in many specimens that I have examined. Graham, Cat. p. 233; Dalz. & Gibs. p. 288; Watt, Diet. Econ. Prod. v. 6, part 2, p. 490. Scirpus grossus var. Kysoor, C. B. Clarke, in Hook. f. Fl. B. I. v. 6 (1893) p. 660; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng.

Pl. p. 1159 .- Flowers: Sept. VERN. Kachar.

KONEAN: beds of rivers in both Konkans, Graham; Bombay, Dalzell!, cultivated, Woodrow,—Distrin. More or less throughout India, sometimes cultivated.

The tubers are dug up in the cold season, sheed and eaten by the natives in many arts of India. They are sweet and starchy and are considered cooling and highly parts of India. nutritious (Watt).

9. Scirpus Kyllingioides, Boeck. in Linnaa, v. 36 (1870) p. 733. Perennial, glabrous; stem 3-6 in. long, slender, with thickened base and sometimes with long slender stolons. Leaves 1-7 the length of the stem, I in. broad, green, keeled, narrowed above and with very minutely dentate margins. Head terminal, 1-1 in. in diam., of 5-15 spikelets; bracts 3, leaf-like, spreading or reflexed, 1-3 in. long. Spikelets very small, closely packed, ovoid-lanceolate, many-flowered. Glumes ovate-lanceolate or oblong-lanceolate, subacute, keeled, many-nerved, straw-colored; hypogynous bristles 0. Stamens 2 or 3; filaments scabrous; anthers small, not crested. Nut obovoid-oblong, minute, scarcely half as long as the glume, equally trigonous or subcompressed, obtuse, shortly apiculate, yellowish-black or reddish, minutely punctulate; style slender, shorter than the nut; stigmas 3. Fl. B. I. v. 6. p. 662; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1158.

KANARA: Young ex C. B. Clarke (Fl. B. I. I. c.).

- I have not seen any Bombay specimens; there are none in Herb. Kew .- Distrib. India (N.-West, Bengal, Rajputana, W. Peninsula); Tropical Africa.
- 10. Scirpus Michelianus, Linn. Sp. Pl. (1753) p. 52. A small glabrous tufted annual; roots fibrous; stems 2-5 in. high, triquetrous, leafy towards the base and there brown. Leaves as long as or sometimes longer than the stem, grass-like, narrowly linear, acute. Spikelets numerous, in dense compound terminal heads 1-3 in. in diam. (generally 1 head in the middle and 4 or 5 in the circumference); bracts many, the longest sometimes reaching 3½ in. long, leaf-like, linear, dilated at the base, acute at the apex. Spikelets 1-1 in. long, oblong, subterete, straw-colored. Glumes $\frac{1}{12}$ in, long, elliptic, hyaline, with a long mucro about 1 the length of the blade, 3-nerved on the back. Stamens usually 2. Nut $\frac{1}{25}$ in, long, fusiform, smooth, pale yellow, minutely

punctate and with (microscopically) narrow hyaline margins; style scarcely $\frac{1}{10}$ in. long, reddish-brown; stigmas 2, as long as or longer than the style, recurved. Fl. B. I. v. 6, p. 662; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1158. Cyperus diffusus, Roxb. Fl. Ind. v. 1 (1832) p. 189. C. pygmæus var. β, Boeck. in Linnæa, v. 35 (1868) p. 494.—Flowers: Oct.

KONKAN: Woodrow. GUJARAT: Pali, Woodrow. SIND: Bhubak, Woodrow.— DISTRIB. Throughout India; Europe, Asia, Algeria.

11. Scirpus squarrosus, Linn. Mant. (1771) p. 181. A slender glabrous tufted annual; root-fibres capillary; stems 3-6 in. long, filiform, terete, striate. Leaves shorter than the stem, filiform, acuminate, erect, smooth, with involute margins; sheaths short, open. solitary or 2-4 in a cluster, sessile, $\frac{7}{8}$ in long, globose or oblong, obtuse, green, many-flowered; rhachilla naked; bracts 1-3, capillary, finely acuminate, leaf-like, dilated at the base, one or two sometimes 1 in. long. Glumes $\frac{1}{\sqrt{n}}$ in. long, closely imbricate, squarrosely spreading and recurved, trapeziform with acutely angled sides, narrowed above into a recurved cusp as long as or longer than the blade with a stout central nerve. very caducous in fruit; hypogynous bristles 0. Stamens 1 or 2; anthers minute, oblong, apiculate, yellow. Nut 10 in. long, obovoidellipsoid, trigonous, yellow, brown or ultimately black; style very short or 0; stigmas 3, minute, recurved. Fl. B. I. v. 6, p. 663; Grah. Cat. p. 233; Boeck. in Linnaa, v. 36 (1870) p. 734; Trim. Fl. Ceyl. v. 5, p. 74; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1158. Isolepis squarrosa, Rom. & Schult. Syst. v. 2 (1817) p. 111; Dalz. & Gibs. p. 286.—Flowers: Oct.-Dec.

Widely distributed throughout the Presidency.—Distrib. More or less throughout India; Ocylon, Tropical Africa, Java, China.

8. ERIOPHORUM, Linn.

1. Eriophorum comosum, Wall. Cat. (1828) 3446. A glabrous herb; rhizome scarcely any; stems 6-20 in. long, tereto below, trigonous at the top, leafy at the very base. Leaves equalling or exceeding the stem, rigid, linear, narrow, with serrulate margins; sheaths brown, shining, striate. Umbel supra-decompound, 2-8 in. in diam., with many rays, the spikelets usually solitary on the top of the rays with 1 or 2 sessile ones in the forks; bracts very long, sometimes reaching 12 in., leaf-like. Spikelets numerous, reaching $\frac{1}{4}$ in. long, elliptic-oblong, obtuse, terete, reddish-brown. Glumes $\frac{1}{6}$ by $\frac{1}{30}$ in., oblong-lanceolate, membranous, 1-nerved, mucronate, reddish-brown. Anthers large, yellow with a long lanceolate pointed bright-red crest. Nuts nearly

\(\frac{1}{5}\) in, long by about \(\frac{1}{5}\) in, wide, linear-oblong or subfusiform, trigonous, acute, shining, greyish-black, with numerous erect white bristles reaching \(\frac{1}{5}\) in, long at the base; style \(\frac{1}{15}\) in, long, reddish-brown; stigmas 3, as long as the style, reddish-brown, much exserted. Fl. B. I. v. 6, p. 664; Dalz. & Gibs. p. 289; Boeck. in Linnaa, v. 37 (1871) p. 98; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1157; Watt, Dict. Econ. Prod. v. 3, p. 266.—Flowers: Oct.

Decean: W. Decean, near Junnar, Dalzell & Gibson; near Junnar, Bhir: Gujarat: Champanir, Woodrow. Sind: Pinwill!—Distrib. Throughout India; Tonkin, China.

The plant is used to make ropes and mixed with Lehamum angustifolium is often exported to the plains from the Himalayas (see Watt, Dict. Econ. Prod. l. c.).

9. FUIRENA, Rottb.

Annual or perennial, glabrous or pubescent leafy herbs. Leaves linear-lanceolate; sheaths entire, with an annular membrane at the mouth. Spikelets many-flowered, in dense axillary pedunculate and terminal clusters. Glumes imbricate all round the rhachilla, orbicular or ovate-oblong, membranous, with a stout 3-nerved keel ending in a cusp or stout scabrid awn; hypogynous bristles 3, minute, or 0; hypogynous scales (petals) 3, enclosing the nut, linear, quadrate or obovate, strongly 3-nerved, glabrous or ciliate. Stamens 2-3. Ovary trigonous; style slender, finally deciduous; stigmas 3. Fruit a trapezoidal trigonous nut, narrowed or stipitate below, with a long or short cusp or beak above, the angles acute, the sides smooth, pale.—Distrib. Species 25, scattered through all warm regions.

ns long ns the blade.

Spikelets \(\frac{1}{2} \) \text{in, long; rhachilla obsolete; claw of petals} \\
2. \) F. glomerata.

shorter than the blade.

Shorter than the blade.

Perennial; rhachilla slender; petals sessile or nearly so...

4. F. unchellata.

1. Fuirena Wallichiana, Kunth, Enum. v. 2 (1837) p. 182. Rhizome creeping, short or long; stems many, 1-11 ft. high (rarely higher), triquetrous, more or less pubescent towards the apex. Leaves 2-8 by 1-1 in., linear-lanceolate, acute, with a strong midnerve and recurved margins; sheaths long, trigonous, striate, with a short ligule. Spikelets in corymbose terminal clusters; bracts small. Spikelets 1-1 in. long, oblong, terete, many-flowered. Glumes & in. long (not including the stout conical slightly hairy mucro, which reaches $\frac{1}{20}$ in. long), broadly oblong, rounded at the apex below the mucro, green with red streaks by transmitted light, pubescent and ciliato; hypogynous bristles shorter than the nut, reddish-brown; hypogynous scales (petals) Anthers linear-oblong, not crested. Nut 2 in. long, turbinate, with a conical pubescent apex, trigonous, longitudinally ribbed, trabeculate between the ribs, pale yellow; style 15 in. long; stigmas 3, about as long as the style. Fl. B. I. v. 6, p. 665; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 432. Fuirena cuspidata, Kunth, Enum. v. 2 (1837) p. 187; Dalz. & Gibs. p. 286. F. pubescens, Boeck. in Linnan, v. 37 (1871) p. 104 (not of Kunth).—Flowers: Sept.

DECCAN: watery places, Dalzell!; Poona, Woodrow, 882!, Jacquemont, 413!—DISTRIB. India (N.-West, Central India, W. Peninsula).

2. Fuirena glomerata, Lam. Illust. v. 1 (1791) p. 150. Annual; stems 4-16 in. long, slender, erect, leafy, sparsely hairy above, glabrous or nearly so below. Leaves 2-5 by \(\frac{1}{4}\) in., linear-lanceolate, acuminate, 3-5-nerved, hairy; sheaths long, closed, striate. Spikelets clustered, approximate; bracts 0 but the leaf under each cluster of spikelets. Spikelets 1-1 in., ovoid or oblong, obtuse, brown; lowest glumes longest, empty. Glumes \(\frac{1}{5}\) in. long (including the stout hairy awn which sometimes reaches in long), squarrosely imbricate, at length deciduous, membranous, obovate-oblong, obtuse, the keel ending in a long awn, the tip ciliolate, the back sometimes with a few bristles; hypogynous scales (petals) nearly $\frac{1}{\sqrt{6}}$ in long, with a slender stalk about equalling the blade, the blade quadrate, strongly 3-nerved, with 3 acute lobes or teeth at the apex, of which the middle one is the longest, hastate or cordate at the base, brown, membranous. Nut $\frac{1}{30}$ in. long, stipitate, trigonous with acute angles, subrotund or broadly obovoid, cuspidate, smooth, pale; style $\frac{1}{30}$ in. long: stigmas 3, nearly as long as the style. Fl. B. I. v. 6, p. 666; Boeck. in Linnea, v. 37 (1871) p. 107; Trim. Fl. Ceyl. v. 5, p. 79; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1157. Fuirena ciliaris, Roxb. Hort. Beng. (1814) p. 81; Grah. Cat. p. 232.—Flowers: Nov.

Konkan: Stocks!, Law!; Savantradi, Woodrow. Gujanat: Godra, Woodrow.— Distrib. Throughout the warmer parts of India, common in rice-fields; Ceylon, Tropical Africa, S.E. Asia, and Australia.

3. Fuirena uncinata, Kunth, Enum. v. 2 (1837) p. 184. Annual; stems 4-12 in. long, rather stout, leafy, glabrous below, more or less pubescent above. Leaves 2-6 by $\frac{1}{5}$ - $\frac{1}{4}$ in., linear-lanceolate, acuminate, membranous, 3-5-nerved, laxly hairy on both sides; sheaths long, closed, hairy. Spikelets \(\frac{1}{3}\)-\frac{1}{5}\) in. long, densely crowded in capitate axillary, sessile or pedunculate, simple or lobed clusters 1-1 in. in diam., palebrown; lowest glumes longest, empty, with a broad membranous blade and rather longer awn than the others; rhachilla scarcely any; bracts. at the base of the clusters like large glumes within which are a few very short broad hyaline ciliate scales unlike either the bracts or glumes. Glumes $\frac{1}{2}$ in. long (excluding the recurved stout laxly hairy mucro $\frac{1}{2}$ in. long), obovate, obtuse, cymbiform, pubescent on the back, hispid and hispidly ciliate at the apex, 5-nerved; hypogynous scales quadrate, shortly clawed, $\frac{1}{25}$ in. long, with a short scabrid awn at the apex and often a minute triangular tooth at each side of the awn. Nut 1 in. long, shortly stalked, obovoid, trigonous, with a curved beak, pale, almost white; style longer than the nut; stigmas 3, nearly as long. I have not found the awns of the glumes hooked as stated by Mr. Clarke, but merely recurved. Fl. B. I. v. 6, p. 666; Boeck. in Linna, v. 37 (1871) p. 108; Trim. Fl. Ceyl. v. 5, p. 79; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432.—Flowers: Dec.

KANARA: Thomson!-Distrib. India (W. Peninsula); Coylon.

4. Fuirena umbellata, Rotth. Descrip. et Icon. (1773) p. 70, t. 19, fig. 3. Perennial; rhizome creeping, stout, horizontal, woody, with filiform root-fibres; stems 1-4 ft. long, stout or slender, striate and ribbed, glabrous or nearly so, with nodes throughout their length. Leaves variable, 6-10 in. long, up to 3 in. broad, linear-lanceolate, acuminate, 3-5-nerved, often ciliate towards the base, the margins smooth or nearly so; sheaths long, closed at the mouth, with a small brown ligule. Spikelets 1-3 by 1 in., sessile, oblong, crowded in simple or compound axillary and terminal pedunculate sometimes subpaniculate dark-brown clusters 2-1 in. in diam., with tomentose or villous peduncles; rhachilla slender; bracts beneath the clusters short, cuspidate. Glumes closely imbricate, at length deciduous, 10 in. long (not including the mucro), obovate-oblong, rounded or sometimes slightly retuse at the apex, membranous, pubescent on the back and with the upper margins ciliate, strongly 3-nerved, the nerves uniting into a strong, more or less hairy mucro about $\frac{1}{2\pi}$ in. long; hypogynous scales (petals) $\frac{1}{2\pi}$ in. long, nearly sessile, quadrate-obovate, reddish-brown, 3-nerved, the upper margin thickened, apiculate. Stamens 3. Nut 20-16 in long, trapezoidally obovoid, stipitate, trigonous with sharp angles, chestnut-brown, smooth, with a long pale beak; style 1, in, long; stigmas 3, as long as the style. Fl. B. I. v. 6, p. 666; Boeck in Linner, v. 37 (1871) p. 110; Trim. Fl. Ceyl. v. 5, p. 80; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1157.-Flowers: Nov.

DECCAN: Alandi, Woodrow. S. M. Country: Londa, Woodrow.-Distrin. More or less throughout India; Ceylon, most warm (not too dry) countries.

10. HYPOLYTRUM, L. C. Rich.

Stout perennial herbs with a woody rootstock and very stout reotfibres; stem erect, trigonous, leafy. Leaves long, narrow, linear or ensiform, coriaceous, 3-nerved. Spikelets small, ovoid or subglobose, in broad subumbellate panicles with stout spreading branches, or the punicle contracted into a more or less compact lobed head; bracts leaf-like. Glumes containing 1 hermaphrodite flower having 2 opposite, lateral, keeled, free or connate hypogynous scales (or bracteoles) containing 2 (rarely 3) stamens and a pistil; hypogynous bristles 0. Stamens 2 (rarely 3); filaments elongate. Ovary terminal, flattened, beaked; style continuous with the ovary, early deciduous; stigmas 2-3, filiform, sometimes thickened at the apex. Fruit a rounded or obtusely angled nut with a thick hard endocarp, beaked, often with vein-like sculpturing.—Distrib. Tropical regions of both hemispheres; species 39.

Mr. Clarke regards the whole not as a single flower, but as an inflorescence with the glumes between the stamens and pistil undeveloped.

1. Hypolytrum Wightianum, Bocck. in Linna. v. 37 (1871) p. 130. Glaucescent; root-fibres stout; stem slender. 2-3 ft. long, trigonous, scarcely as thick as a goose-quill, quite smooth. Leaves rather rigid, often longer than the stems, linear, acuminate, flat or with the basal portion complicate, 3-nerved, \(\frac{1}{2}-\frac{1}{2}\) in. broad, the margins and midrib spinulose towards the top. Spikelets in dense compound

corymbose depressed panicles; bracts leaf-like, 2-6 in. long. Spikelets 1-1 in. long, sessile or shortly pedicellate, subglobose or oblong-eylindric. Glumes 10-15 in. long, oblong, obtuse, sometimes apiculate, 1-nerved, with scarious margins, brown speckled with minute darker spots; hypogynous scales (or bracteoles) $\bar{2}$ at the base of the nut, $\frac{1}{10}$ by $\frac{1}{26}$ in., oblong, obtuse, cymbiform, scarious, with a scabrous or hairy keel. Stamens 2; filaments long, slender; anthers linear-oblong. Nut 1-1 in. long, ovoid-lanceolate, terete or slightly compressed, beaked, veined below with stout obtuse reins, rellow, minutely dotted with darker spots; style short; stigmas 2. Fl. B. I. v. 6, p. 678; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432.—Flowers: Dec.-Feb.

Stocks without locality in Herb. Kew.! S. M. Country: Castlerock, Kanitkar! KANARA: Dalzell !; Knigal (N. Kanara), Woodrow !- Distrib, India (W. Peninsula, Nicobars).

11. RHYNCHOSPORA, Vahl (Rynchospora).

Usually tail herbs; stems simple, leafy throughout (rarely at the base only), stout or slender. Leaves narrow, often filiform. Spikelets small, ovoid, capitate, corymbose, subumbellate or paniculate, with 1 or 2 bisexual flowers; bracts various. Glumes imbricate all round the rhachilla, membranous or coriaceous, 1-nerved, the 3 or 4 lower shorter, empty, the next 1 or 2 fertile, the uppermost empty; hypogynous bristles 0 or 6 (rarely fewer), scabrid with teeth pointing upwards. Stamens 1-3; anthers linear. Ovary rounded; style slender, glabrous, with conical base; stigmas 2. Nut ovoid or subglobose, turgidly biconvex, smooth or transversely waved, crowned by the conical much enlarged often very long and stout persistent style-base. Distrib. Species 150, in the warmer regions of the world, numerous in America.

Stem leafy towards the base only; spikelets in a single terminal

Nut biconvex, 1's in. long 1. R. Waltichiana. Nut flattened s in. long 2. R. Wightiana. Stem leafy throughout its entire length; spikelets in panion-

1. Rhynchospora Wallichiana, Kunth, Enum, v. 2 (1837) p. 289. Stems 6-24 in. high, leafy at the base only, tufted, slender, striate, trigonous. Leaves shorter than the stem, narrowly linear, up to 1 in. broad, flat or complicate, narrowed from the sheath to the tip, acute. Head of spikelets globose, terminal, brown, shining, 3-5 in. in diam.; bracts 3-8, spreading or deflexed, 1-3 in. long, linear-lanceolate, acute. Spikelets 3 in. long, sessile, densely clustered in a terminal head, lanceolate, acute. Glumes glabrous, shining, chestnut-brown, the lowest 3-4 short, ovate-lanceolate, empty, the fertile glumes $\frac{3}{8}$ in long, ovatelanceolate, acuminate; hygogynous bristles if present as long as the nut ... or shorter, scabrid with teeth pointing upwards. Stamens 2-3; anthers with an acute tip. Nut nearly 10 in. long, with a rather long stalk, turgidly biconvex, strongly margined, with a conical beak, nearly black; style very slender; stigmas 2, very long. Fl. B. I. v. 6, p. 668; Boeck. in Linnan, v. 37 (1871) p. 542; Trim. Fl. Ceyl. v. 5, p. 83; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1131.—Flowers: Aug.

KONKAN: Kalyan, Woodcow, -- Distrin. Throughout India (except the North-West); Ceylon, Malaya, Japan, Tropical Africa, and Tropical Australia.

2. Rhynchospora Wightiana, Steud. Cyp. (1855) p. 148. Stems tufted, 6-16 in. long, slender, trigonous, glabrous; stolons 0. Leaves many, at the base of the stem only and \(\frac{1}{4}\)-\(\frac{3}{4}\) its length, linear, acuminate, grass-like, 1 in. broad. Spikelets numerous, in reddish-brown heads $\frac{3}{5}$ in. in diam.; bracts 3-6, unequal, the longest reaching 3 in. long, linear-lanceolate, acuminate, dilated and ciliate at the base. Spikelets $\frac{1}{4} - \frac{3}{8}$ in. long, lanceolate, acute, reddish-brown, smooth and shining. Glumes 6-7, elliptic-lanceolate, very acute, 4 in. long, the 3 or 4 lowest empty, the next 2-sexual and larger than the lower ones, the upper male or rudimentary; hypogynous bristles 6, unequal, 1-1 in. long, slender, scabrous with numerous minute teeth pointing upwards, brown. Nut in. long, compressed, rounded at the apex below the beak, oblong, dark brown, with pale papilla; beak 20 in. long, compressed-conical, nearly white; style & in. long, very slender, brown; stigmas 2, very minute. Fl. B. L. v. 6, p. 669; Boeck. in Linnwa, v. 37 (1872) p. 544; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 432.—Flowers: Aug.

KONKAN: Law!; Bombay without authority in Herb. Kew.! Deccan: Khandala, Jacquemont, 6491, Woodrow; Poona, Woolrow.—Distrib. India (W. Peninsula); Cochinchina.

3. Rhynchospora aurea, Valil, Emon. v. 2 (1806) p. 229. Rootfibres stout; stems 2-3 ft. long, leafy throughout, trigonous with smooth angles; stolons 0. Leaves 1-2 ft. by 1-3 in., contracted at the sheath, then narrowed to the acute tip, flat, the margins and the slender keel scabrid; sheaths of the upper leaves closed, those of the lower open. Spikelets clustered or spicate at the ends of the branches of large corymbiform decompound terminal and axillary umbels; bracts up to 6 in. long. Spikelets 1-1 in. long, narrowly ovoid, acuminate, reddishbrown. Glumes 6-7, the 3 or 4 lower empty, ovate, mucronate or awned, the next 2-sexual reaching 1 in. long, ovate, mucronate or awned, 1-nerved, keeled, cymbiform, the upper male or empty; hypogynous bristles 6 or fewer, very slender, scaberulous, shorter than the nut. Nut (including the beak) reaching \(\frac{1}{2} \) in. long, brown, often exserted from the glume, the portion below the beak obovoid, compressed, with slightly undulate faces; beak reaching & in. long, conical, hard, neute, as broad as the nut at the base and broadly channelled down the centre; style long, slender; stigmas 2, very minute. Fl. B. I. v. 6, p. 670; Boeck. in Linnea, v. 37 (1873) p. 626; Trim. Fl. Ceyl. v. 5, p. 83; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1134. Rhynchospora articulata, Roem. & Schult. Syst. Mant. v. 2 (1824) p. 49; Dalz. & Gibs. p. 288. Schanus articulatus, Roxb. Hort. Beng. (1814) p. 81; Grah, Cat. p. 233.

S. M. Country: Young ex Woodrow.

This plant is given both by Graham and Dalzell & Gibson, neither of whom has assigned any locality to it. There are no specimens from Bombay in Herb. Kew.—Distrin. More or less throughout India; Ceylon, warm regions of the globe.

12. REMIREA, Aublet.

A low creeping branched rigid glabrous perennial, growing on sandy shores of sea-coasts; rhizome or subterranean stem sometimes several feet long, rooting at the nodes, giving off short, erect, densely leafy flowering branches; internodes of the rhizome often long, reaching 1-2 in.; sheaths scarious, acuminate; flowering branches clothed below with imbricating scarious sheaths. Leaves numerous on the branches, rigid, spreading and recurved, pungent; sheaths very short, open. Spikelets small, short, 1-flowered, crowded in a terminal ovoid solitary or lobed head. Glumes 4, the 3 lower empty, the second and third larger than the lowest, suborbicular, concave, the upper fertile very thick, corky, 1-flowered; hypogynous bristles 0. Stamens 3; anthers linear, acute. Nut closely embraced by the 2 upper glumes, linear-oblong, obtusely trigonous, beaked; style very short, thickened at the base; stigmas 3, short.—Distrib, Sea-coasts in Tropical countries.

1. Remirea maritima, Aubl. Hist. Pl. Guian. v. 1 (1775) p. 45. Rhizome as thick as a crow-quill, curved, hard, terete, horizontally creeping; sheaths leafless, as long as or sometimes longer than the internodes, acuminate. Branches erect or ascending, 2-6 in. long. simple, sheathed in the lower part with stout ovate acute finely striate scarious sheaths, densely leafy above often to the apex. Leaves crowded, rigid, recurved, linear, narrowed above, keeled and channelled, with infolded sides, triquetrous and pungent at the apex. Heads of spikelets solitary or 3 or more close together; bracts 3-4, leaf-like, usually longer (rarely shorter) than the heads. Spikelets sessile or very shortly pedunculate, 1-1 in. long and broad; lowest glume small, the next 2 larger, broadly ovate or suborbicular, concave, multistriate, coriaceous, with scarious margins; flowering glume oblong, cymbiform, nearly as long as the outer glumes, smooth, ultimately corky, pale brown, closely embracing the nut. Stamens 3; filaments long, flat. Nut 1 in. long, oblong, tapering at both ends, compressed, minutely punctulate, dark brown or nearly black; style hardly $\frac{1}{30}$ in. long; stigmas 3, short, but longer than the style. Fl. B. I. v. 6, p. 677; Boeck. in Linnan, v. 35 (1868) p. 435; Trim. Fl. Ceyl. v. 5, p. 87; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432.

KANARA: Thomson!, Talbot ex C. B. Clarke.—Distrib. Sea-coasts in India; Coylon, most tropical sea-coasts.

13. SCLERIA, Berg.

Perennial (rarely annual) erect leafy herbs; stems trigonous or triquetrous. Leaves narrow or broad. Flowers all unisexual. Spikelets dimorphic, androgynous or male, and female, solitary or clustered on the branches of a panicle, mixed with hyaline scales (rarely spicate or capitate); bracts often foliaceous; bractcoles usually filiform. Glumes 1-nerved. Male or androgynous spirillets narrow. Glumes many, the 5-6 lower distichous, the intermediate convolute, membranous, enclosing many narrowly linear hyaline scales. Stamens 1-3; anthers narrowly linear, cuspidate. Overy sterile or 0. Fimale spirillets shorter, broader, 1-flowered. Glumes 3 or more, distichous, the lower

2-3 empty, the next above fertile, the upper empty. Disk at the base of the overy annular (rarely obscure), often enlarged and lobed in fruit. Overy minute; style slender; stigmes 3. Fruit a globose or oblong nut, usually white and polished, smooth or sculptured.—Distrib. Most tropical and subtropical regions; species about 160.

Disk of female flowers 0	1. S. litl esperiva.
Disk of female flowers capular or 3-lobed.	.
Disk cupular	2. S. annularis.
Disk 3-lobed,	
Leaves 10-1 in. broad.	
Nut tessellately cancellate	
Nut smooth	4. S. hebecarpa.
Leaves 1-1 in. broad.	
Disk 1-seriate; nut globose, 1/2 in. in diam	5. S. biflera.
Dick 2-scriate; nut ellipsoid, 1-1 in. long	6. S. Stockriana.

1. Scleria lithosperma, Sw. Frodr. (1788) p. 18. Rhizome hard, elongate, horizontal, nodose; root-fibres slender, wiry; stems not tufted, $1\frac{1}{2}$ -3 ft. long, very slender, trigonous, smooth. Leaves as long as or shorter than the stem, narrowly linear, $\frac{1}{2}$ - $\frac{1}{2}$ -in. broad, narrowed to the subobtuse tip; sheaths trigonous, closed, glabrous or hairy. Spikelets few, subsolitary, distant on the filiform rhachis and on the few distant branches of slender terminal and axillary subspiciform panieles, darkbrown; bisexual spikelets many; bracts and bracteoles long, slender, almost capillary. Fruiting spikelets $\frac{1}{10}$ in. long. Glumes broadly ovate, cuspidately acuminate. Disk-lobes obsolete. Nut $\frac{1}{10}$ in. long, broadly ellipsoid, obtusely trigonous, smooth, polished, white; style about $\frac{1}{10}$ in. long; stigmas 3, longer than the style. Fl. B. I. v. 6, p. 685; Grah. Cat. p. 2:33; Dalz. & Gibs. p. 288; Boeck. in Linnæa, v. 38 (1874) p. 451; Trim. Fl. Ceyl. v. 5, p. 96; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1132.—Flowers: Dec.

KONKAN: Matheran, Woodrow. KANARA: Tulbet, 562, ex C. B. Clarks.—Distrib. Throughout India (except the West arid area); Coylon, most warm regions except Continental Africa.

2. Scleria annularis, Kunth, Enum. v. 2 (1837) p. 359. Root fibrous; rhizome 0; stem erect, 1-2 ft. high, compressed, triquetrous, slender, scabrous at the apex with spinules pointing downwards. Leaves 6-12 by \(\frac{1}{2}\) in., linear, subacute, keeled, 3-nerved, the margins and keel scabrous; sheaths 3-winged, hairy or glabrous. Panicles axillary, remote, subspicate, rather dense, oblong, 1-2 in. long; bractcoles conspicuous, linear-lanceolate, acuminate, leaf-like. Spikelets oblong, acute. Glumes \(\frac{1}{4}\) in. long, reddish-brown, ovate-lanceolate, cuspidate, acutely keeled, the keel spinulose above. Nut \(\frac{1}{10}\) in. long, ellipsoid, terete or obscurely trigonous, rounded at the apex, smooth, white. Disk shallowly cup-shaped, small, brown, not lobed, closely appressed to the base of the nut. Fl. B. I. v. 6, p. 687; Boeck, in Linnea, v. 38 (1874) p. 456; Woodr, in Journ, Bomb, Nat. v. 13 (1901) p. 432.

KONKAN: Stocks!, Law! KANARA: Law!-Distrib. India (N.-West, Central India, W. Peniusula); China.

3. Scleria tessellata, Willd. Sp. Pl. v. 4 (1805) p. 315. Root fibrous, the fibres very dark, nearly black; stems many, tufted, slender, 1-2½ ft. long, triquetrous. Leaves 6-12 by $\frac{1}{10}$ in. or less, linear, sub-

acute or obtusely acuminate, rigid, 3-nerved, with involute scaberulous margins; sheaths trigonous, closed, the mouth truncate. Spikelets solitary or in small clusters on the branches of narrow erect terminal and subterminal sparingly branched panicles 2-3 in. long; bracteoles filiform. Fruiting spikelets $\frac{1}{10}$ in. long. Glumes 3, broadly ovate, acuminate, dark brown. Disk-lobes small, thick, triangular, obtuse, creamy-white. Nut globose, $\frac{1}{10}$ in. in diam., tessellately cancellate in vertical lines, top rounded, not beaked, white, not or rarely puberulous with reddish hairs on the ridges. Fl. B. I. v. 6, p. 686; Boeck. in Linnæa, v. 38 (1874) p. 470; Trim. Fl. Ceyl. v. 5, p. 98; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1132.

KONKAN: near Panvel, Jacquemant!—Distrib. Throughout India (except the West arid aren); Ceylon, Malnya, China, Japan, Australia.

4. Scleria hebecarpa, Nees, in Linnaa, v. 9 (1835) p. 303. Rhizome woody, nodose; root-fibres stout; stem 2-3 ft. long or more, triquetrous. Leaves 10-12 by \(\frac{1}{6}-\frac{1}{3}\) in., narrowed to the obtuse tip, multistriate, flat, 3-nerved, rigid, usually with scabrous margins; sheaths trigonous, closed, the mouth truncate, with an ovate corinceous pubescent ligule, the sheaths of the middle stem-leaves winged. Spikelets all unisexual, solitary or in small clusters on the suberect branches of narrow terminal and subterminal sparingly branched panicles 2-3 in. long; bracts 2-4 in. long, leaf-like; bracteoles filiform, \(\frac{1}{2}-\frac{3}{4}\) in. long. Fruiting spikelets \(\frac{1}{4}\) in. long. Glumes 3, the upper broadly ovate, cuspidate. Disk-lobes triaugular-ovate, acute, with a broad sinus, \(\frac{1}{4}-\frac{3}{4}\) the height of the nut. Nut \(\frac{1}{6}\) in. long, globose or broadly ovoid, obscurely trigonous, apiculate, white, smooth, polished. Fl. B. I. v. 6, p. 689; Boeck. in Linnæa, v. 38 (1874) p. 478; Trim. Fl. Ceyl. v. 5, p. 99; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432.

KONBAN: Stocks!, Law! KANARA: N. Kanara, Talbot ex Woodrow.—DISTRIB: Throughout India (except the N.W. arid region); Ceylon, Malaya, Ohina, Japan, Australia, Polynesia.

5. Scleria biflora, Roxb. Fl. Ind. v. 3 (1832) p. 573. Root fibrous; stems tufted, 1-2 ft. long, trigonous, slender, leafy. Leaves 6-10 by \(\frac{1}{3} \) in., ensiform, obtuse or subscute, thin, flat, 3-nerved, the margins smooth or scaberulous; sheaths loose, closed, trigonous, the mouth truncate. Spikelets solitary or in small clusters on the branches of slender, erect, terminal and subterminal, sparingly branched panicles 2-3 in. long; bracteoles filiform, \(\frac{1}{5} \) in. long. Fruiting spikelets \(\frac{1}{10} \) in. long. Glumes 3, broadly ovate, acuminate. Disk 3-lobed, the lobes ovate, acuminate, large, often half the length of the nut, reddish-brown. Nut globose, \(\frac{1}{5} \) in. in diam., tessellately cancellate in vertical lines, pubescent on the ridges with reddish-brown hairs, shortly beaked, white. Fl. B. I. v. 6, p. 687; Trim. Fl. Ceyl. v. 5, p. 99; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 432; Prain, Beng. Pl. p. 1132. Scleria Steudeliana, Miq. Fl. Ned. Ind. v. 3 (1859) p. 344; Boeck. in Linnæa, v. 38 (1874) p. 475.—Flowers: Dec.

Closely allied to S. tessellata, from which it differs in the leaves which are broader, in the disk-lobes which are much larger, and in the nut which is beaked.

Konkan: Matheran, Woodrow, 77!—Distrib. India (N. & E. Bengal, Cachar, W. Peninsula); Ceylon, Malaya, S. China.

6. Scleria Stocksiana, Bocck. in Linnaa, v. 38 (1874) p. 474. Root fibrous, small; stem 6-15 in. long, erect, slender, striate, triquetrous above, scabrous on the margins, the minute spinules on the upper part pointing upwards, those below pointing downwards. Leaves 6-12 in. long, linear, acuminate, & in. broad, multistriate, with scabrous margins. Panicle elongate, slender, the lower branches remote; sheaths long, striate, truncate, usually hairy at the mouth; bracts of variable length, leaf-like, 12-1 in. broad; bracteoles narrowly linear, acute, much longer than the spikelets. Spikelets with female and androgynous flowers more or less mixed with males, oblong, obtuse. Glumes ovatelanceolate. Nut 1-1 in. long, exceeding the glumes, globosely ellipsoid, truncate at the base, slightly umbonate at the apex, terete or obsoletely trigonous, densely cancellate-reticulate. Disk 2-seriate, the outer with 3 broad rounded spreading lobes, dark-brown with a whitish margin. the 3 inner lobes ovate, acute, closely appressed to the nut, whitish. Fl. B. I. v. 6, p. 687; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 432,

Konran: Stocks!, Law! S. M. Country: Londa, Woodrow! Kanara: Weedrow, 76!—Distrin. India (W. Peninsula).

14. CAREX, Linn.

Perennial, glabrous (rarely pubescent) grassy sedges; stems leafy, chiefly at the base; spikelets solitary or few, one terminal, the others lower down (rarely all clustered in terminal or axillary panicles or compound spikes), unisexual or androgynous, the lower spikelets female with a few males at the base or top, very rarely diocious, uppermost often wholly male. Glumes many, imbricate all round the rhachilla, persistent or deciduous; flowers solitary in the glumes. Male flowers of 2-3 stamens; anthers linear, obtuse. Female flowers a compressed or triquetrous ovary enclosed in an urccolate usually 2-toothed utricle; style usually slender; stigmas 2 or 3, protruding from the utricle.—Distrib. Species about 500.

Spikelets short (\frac{1}{2} in, long or less), numerous, arranged in compound panieles.

Nuts 3-1; beak of utricle \frac{1}{2} the length of the body; style much shorter than the nut; female glumes ovate-lanceolate, shortly apiculate.

Nuts 6-10; beak of utricle nearly as long as the body; style nearly as long as the nut; female glumes elliptic, conspicuously aristate.

Spikes 1-14 in, long, few (3 or fewer), very remote, slender, racemosely arranged.

1. C. condensita.

2. C. mercarensis
[var. major.
3. C. speciosa.

1. Carex condensata, Nees, in Wight, Contrib. (1834) p. 123. Stem 2-3 ft. high, erect, rigid, slender, obtusely triquetrous above, smooth, leafy. Leaves long, linear, acuminate, flat, with minutely scabrous margins, \(\frac{1}{2}\)-\(\frac{1}{6}\) in. broad, the upper exceeding the inflorescence. Panicle axillary, decompound, pale brown, concolorous, 6-8 in. long; partial panicles \(\frac{1}{2}\)-\(\frac{1}{2}\)-in. long, much-branched, the upper approximate, the lower rather remote, pedunculate; bracts foliaceous with long sheaths; bracteoles beneath the spikelets filiform. Spikelets sessile, \(\frac{1}{2}\)-\(\frac{1}{3}\) in. long, with 3-4 nuts, reddish-brown, oblong, terete, with many male flowers. Glumes reaching \(\frac{1}{4}\) in. long, ovate-lanceolate, neute, apiculate, membranous, pale brown. Utricle rather more than \(\frac{1}{4}\) in.

long, yellowish-brown, dotted with ferruginous spots, straight or slightly curved, ovoid-lanceolate, trigonous, irregularly ribbed, scabrous-pilose; beak \(\frac{1}{3} \) the length of the utricle, 2-fid. Nut \(\frac{1}{16} \) in. long, ellipsoid, trigonous, very shortly stipitate; style about \(\frac{1}{16} \) in. long; stigmas very short. Fl. B. I. v. 6, p. 716; Boott, Carex, part 2 (1860) p. 86, tt. 247, 248. Carex indica, Nees, in Wight, Contrib. (1834) p. 123 (not of Linn.); Dalz. & Gibs. p. 288; Grah. Cat. p. 233. O. bengalensis, Roxb. Hort. Beng. (1814) p. 103; Boeck. in Linnæa, v. 40 (1876) p. 346.

Deccan: Mahableshwar, Dalzell & Gibson. Sind: Pinwill,—Distrib. India (Himalaya and Khasia Hills).

2. Carex mercarensis, Hochst. cv Steud. Syn. Pl. Cyp. (1855) p. 194. VAR. major, Stend. I. c. Rhizome short, hard, subtuberous: root-fibres long, stout; stem erect, slender, 1-2 ft. high, firm, triquelrous, smooth. Leaves shorter than the stem, $\frac{1}{5} - \frac{3}{6}$ in broad, linear, acuminate, multistriate and with a strong midrib. Inflorescence clongate; partial panicles oblong or scarcely pyramidal; branches erect, spreading; bracts foliaceous, much longer than the panicles. Spikelets $\frac{3}{8}$ - $\frac{5}{8}$ in. long with distant glumes, the female flowers 6-10 in the lower part of the spikelet, the males very few at the apex. Female glumes in. long, elliptic, aristate. Utricle (including beak) in long, trigonous, straight or slightly curved, scabrous-hairy, with numerous slender nerves; beak nearly as long as the body, shortly 2-toothed or sometimes entire. Nut 12-10 in. long, ellipsoid, acutely trigonous, shortly stipitate, pale-yellow; style as long as the nut; stigmas rather shorter than the style. Fl. B. I. v. 6, p. 719. C. mcrcarensis, Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433.—Flowers: Oct.

DECCAN: Mahableshwar, Woodrow, 791 S. M. COUNTRY: Londa, Woodrow. KANARA: Hulgi (N. Kanara), Talbot ex Woodrow.—Distrib. India (W. Peninsula).

3. Carex speciosa, Kunth, Enum. v. 2 (1837) p. 504. Glabrous; rhizome short or long; stems cospitose, 1-11 it. long, slender, winged and scaberulous at the apex below the inflorescence. Leaves subbasal, often exceeding the stem, $\frac{1}{2}$ in. wide, linear, acuminate, multistriate, flat. Peduncles radical, 6-12 in. long, surmounted by narrow oblong spikes 1-14 by in.; male flowers in the upper third of the spike which is attenuated in the male portion; female flowers at the base of the spike; bracts foliaceous, shorter or longer than the inflorescence, shortly sheathed. Glumes broadly ovate or suborbicular, obtuse or abruptly apiculate, reaching 1 in. long, multistriate, all green, concolorous. Utricle reaching 4 in. long, acutely trigonous, multistriate, concave on the inner face, rounded on the back, the two interior margins slightly winged and ciliate; beak 10 in. long, conical, truncate, 2-fid, with ciliate margins. Nut 1 in, long, ellipsoid, trigonous, with prominent angles, stipitate, pale brown with darker markings, finely reticulate; style persistent, very stout, conical, thickened at the base; stigmas very short. Fl. B. I. v. 6, p. 729; Boott, Carex, part 1 (1858) p. 53; Boeck. in Linnea, v. 40 (1876) p. 388; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433; Prain, Beng. Pl. p. 1130. -Flowers: Oct.

KANADA: Hulgi (N. Kanara), Talbot, 2282 :- Distrib. Throughout India; Borneo.

ORDER CXLVII. GRAMINEÆ.

Erect decumbent or creeping herbs (rarely suffruticose), or in Tribe Bambusco shrubs or trees; stems usually branched at the base, terete or compressed, with hollow or solid internodes. Leaves distichous, simple, usually long and narrow, generally parallel-nerved, with a sheathing base (sheath) distinct from the blade and rarely an interposed petiole; sheath split to the base (very rarely entire), with usually a transverse erect appendage (liquid) consisting of a membrane or a fringe of hairs at the union with the blade. Inflorescence terminal (rarely terminal and lateral), composed of variously arranged spikelets. paniculate, racemose, capitate, simply or compoundly spicate (rarely of a single spikelet). Spikelets consisting of an axis (rhachilla) and typically of 3 or more alternate distichous more or less heteromorphous bracts (glumes), of which the two lowest (involucral glumes) form an involuere to the spikelet and are empty, while the following (floral glumes) hear in their axils subsessile flowers subtended by a hyaline 2-keeled or 2-nerved dorsal scale (palea); floral glumes differing usually in structure and size from the involucral glumes, and forming with the palea and the flower proper false flowers (florets), which are alike or different in structure and sex. Flowers hermaphrodite or 1-sexual (often with the rudiments of the other sex), consisting of 2 (rarely 3) minute hyaline fleshy scales (lodicules) which represent a perianth (sometimes absent), and of stamens or a pistil or both. Stamens usually 3 (rarely 6, 4, 2, or 1, very rarely more), hypogynous; filaments slender, usually free; anthers versatile, fugacious, with 2 parallel cells, usually dehiscing by a longitudinal Ovary entire, 1-celled; ovule erect, anatropous; styles 2 (rarely 3 or 1), free or connate at the base, usually clongate and exserted from the spex or sides of the spikelet, clothed with simple or branched stigmatic hairs. Fruit a seed-like grain, free within the flowering glume and palea or adnate to either or both; pericarp very thin (rarely thick and separable from the seed). Seed erect; albumen copious, floury; embryo minute, at the base of and outside the albumon; cotyledon shield-shaped with an erect conical plumule and a descending conical radicle.—Distrib. Genera about 325; species more than 3000, in all parts of the world.

I have, at Dr. Stapl's suggestion, adopted for the two classes of glumes the terms involveral and floral. In the clavis I have closely adhered to the Tribes adopted by Dr. Stapl in his 'Flora Capensis' (1898).

In citing Trimen's 'Flora of Ceylon,' the Graminew of which have been entirely written by Sir J. D. Hooker, I have, for the sake of brevity, adopted the citation "Trim. Fl. Ceyl." except in cases of descriptions of new species.

SERIES I. Mature spikelets articulate on their pedicels (sometimes inarticulate in *Isachne*) or deciduous with them; spikelets similar or differing in sex and structure, the perfect spikelets with 2 heteromorphous florets, the upper hermaphrodite, the lower male or neuter. Rhachilla not produced beyond the upper floret.

TRIBE 1. PANICEÆ. Spikelets in usually continuous spikes, racemes, or panicles; lower invol.-glume smaller, often minute or suppressed:

lower floral glume generally resembling the invol.-glumes in structure and nervation; upper floral glume firmer, at length rigid, often chartaceous to crustaceous.

Shrubs; flowers diocious	1,	Spinifex.
Herbs; flowers not diocious. Spikelets 2-flowered, the upper 2-sexual; lower male or		
neuter, rarely (Isachne) both fertile.		
Mature spikelets persistent on their pedicels, sur-		
rounded singly or in clusters by an involuced of unked		
or plumose bristles or spines which fall along with		
the spikelets.	0	D
Involuced of bristles		Pryxiserou.
Mature spikelets falling entire and singly from the	u.	Cencurus.
tips of their pedicels.		
Spikelets subtended by an involucel of bristles	4.	SETARIA.
Spikelets not subtended by bristles.		
Branches of the paniele produced Leyond the		
uppermost spikelets; lower involglume		_
minute, orbicular, white, hyaline	5.	Онаижвария.
Branches of the paniele not produced beyond		
the uppermost spikelets. Glumes 4, all distinct or 3 distinct and 1		
obsolete (in Panicum subeglume sometimes		
2 ob-olete).		
Involglumes separately deciduous	6.	ISAGIINE.
Invol. glumes not separately deciduous.		
Spikelets awned (except in Tricholæna		
Tenerilla).		m
Spikelets densely silky	7.	TRICHOLEGA.
Spikelets not silky. Palea of lower floral glume		
very short, 2-fid	8.	Axonorus.
Palea of lower floral glume	٠.	2020701 05,
entire or 0	9.	Orlishenus,
Spikelets not award except in		
Panicum stagninum (mucronate or		
apiculate in a few species of		
Panicum and in Eriochloa). Lower involglume distinct (except		
in Panicum subeylume); in-		
florescence paniculate	10.	PANICOM.
Lower involglume mmute (rarely		
absent); nerves of lower floral		
glume 5-7, straight, prominent;		_
mflorescence usually digitate	11.	DIGITARIA.
Lower involglume absent; nerves		*
of lower floral glume 5 or fower, the side-perves curved,		
Spikelets not thickened at the		
baso	12.	PASPALUM.
Spikelets thickened at base		
•		

TRIBE 2. ANDROPOGONEÆ. Spikelets usually in pairs, one sessile, the other pedicellate, rarely 3-nate or solitary on the axis of a usually spike-like raceme. Invol.-glumes more or less rigid and firmer than the floral glumes, the lower always longer than the florets; floral glumes membranous, often hyaline, that of the upper floret usually awned or reduced to an awn.

	٠
Spikelets all similar.	
Spikelets solitary, secund on a fluform or fluttened	
inniticulate rhachis	
Spikelets in open or contracted princles.	
Receives of spikelets in compound princies,	
Rhachis not fragile,	
Panicle spiciform silky; spikelets 1-flowered 15. Inffnata.	
Rhachis fragile.	
Leaves petiolite; spikelets 2-flowered 16. Spontorogon.	
Lerves not petiolate; spikelets 1-flowered.	
Panicle much branched, open, rilky.	
Spikelets awuless	
Spikelets awned 18. Edianth 8.	
Racemes of spikelets 2-nate, digitate or approximate	
on a short main axis	
Spikelets dissimilar.	
Spikelets of each pair differing in sex and structure or	
(Ophiurus) spikelets solitary not secund.	
Spikelets sunk in pits of an articulate or fragile	
rhachis.	
Sessile spikelets unaccompanied by an upper	
spikelet or the pedicel of one	
Sessilo spikelets accompanied by a dissimilar	
pedicellate spikelet.	
Lower involglume orate or oblong, fint,	
Lower involglume ornte or oblong, fint, smooth	
Lower involglume globose, inflated, pitted 22. Maxisums.	
Spikelets not sunk in nodes of the rinchis.	
Spikelets 3 on a very short uninodal marticulate	
Spikelets 8 on a very short uninodal marticulate rhaches a sessile 2-flowered and 2 pedicellate	
enclosed in a pedanculate spathe 23. Artuba.	
Spikelets many or few on a plurinodal inarticulate	
rincins.	
Spilelets many, 2-nate (rarely solitary), in	
spike-like racemes which are solitary, 2-nate,	
digitate or approximate on a short main axis;	
lower floret of the sessile spikelet male. Margin of lower myol-glume of sessile	
Margin of lower invol-glume of ressile	
spiketet innexed 24. 18ch ench.	
Margin of lower involglume of sessile	
spikelet not inflexed.	
Spikelets 2-awned	ı,
Spikelets 1-awned,	
Pedicellate spikelets floriferous 26. Lornorogov.	
Pedicellate spikelets reduced to	
pedicels often glume-like.	
Spikelets 1-2-flowered; lower	
involglume cuneate-ol-ovate or	
obcordite, villous; lodicules 0, 27. Arocoris.	
Smklet* 1-flowered : lower invol	
glume lanciolite, often muri- culate, lodicules 2. 28. Arthraxos.	
culate, lodicules 2	
Spikelets 2-flowered; lower invol	
glume ovate, beaked, transversely	
rugose, lodicules 2	
Spikelets in compound francles or spike-like	
Spikelets in compound fruncles or spike-like recence, variously disposed, 2-nate (rarely	
3-nate), lower floret of all the spikelets	
empty; upper usually awned or reduced to	
nn nwn.	
Lower involglume furni-hed with oil-	
glands or peniciliste tubercles close to	
the keels; spikelets not as ned but often	
beaked	

when mature, usually 5-nerved, all the nerves or the outer side-nerves often slightly excurrent, parallel, or at least not anastomosing. Spikelets awned or not.

Table 8. ZOYSIEÆ. Mature spikelets falling entire and singly or in clusters. Floret 1. Rhachilla not produced beyond the floret. Glumes equal or the lower much smaller or suppressed. Floral glume small, thinly membranous, 1-3-nerved. Spikelets in slender spiciform panieles or racemes.

Spikelets falling in clusters of 2-4. Spikelets fascicled.

Glumes 3; spikelets with a long awn 49. Pzrotis.

TRIBE 9. SPOROBOLE E. Involueral and floral glumes very similar. Floret 1. Rhachilla not (or rarely) produced beyond the floret. Upper floral glume membranous, acute or obtuse, not changed when ripe, 1- or more or less distinctly 3-nerved, awnless, usually olive-green

or grey; side-nerves, if present, delicate, evanescent above. often free in the delicate pericarp.

Spikelets small 50. Sronobotts.

There 10. ERAGROSTEÆ. Spikelets variously panieled, sometimes spicate or subspicate. Florets usually numerous and far-exserted from the glumes. Involucral and floral glumes somewhat similar in general appearance. Floral glumes membranous or chartaceous, entire or 2-3-cleft, 3-nerved, the nerve evanescent above or excurrent into bristles; side-nerves usually submarginal, glabrous or pubescent or finely ciliate below. Palex often persistent or subpersistent.

Tribe 11. CHLORIDEÆ. Spikelets usually in 2-ranked secund spikes or spike-like racemes, rarely distinctly pedicellate and paniculate. Florets 1 to many. Floral glumes usually membranous, truncate, emarginate or toothed, 3-nerved; nerves distant, subparallel, distinct, percurrent or excurrent, and often ciliate all along, the lateral submarginal (in Eleusine there are sometimes additional side-nerves close to the middle nerve of the glume). Awn, if present, straight, usually from a truncate or toothed tip.

small terminal imperfect ones. Floral glumes subherbacous to sub-corraccous, 5-many-nerved, usually awaless. Lodicules usually 3, Stamens 3-6 or more. Styles 2 or 3.

1. SPINIFEX, Lun.

Directous gregations much-branched rigid littoral bushes; stem and branches woody. Leaves narrow, rigid, involute, spreading and recurved, thickly corinceous. Inflorescence of large terminal globose bracte ite heads, with radiating spike-like ricemes, the mile with many spikelets on each spike, the femile with one only. Mall spikelets 1-2-flowered, districtions, articulate on short pedicels. Glumes 1, chartaceous, acute, strongly nerved; invol.-glumes empty; lower flor if glume pulerte, empty or 3 androus; upper floral glume pulerte, B-androus, the priew of both floral glumes acuminate, as long as the glumes. Anthers linear. Timali spikili is narrower than the male, erect, lanceolate, 1-flowered. Glumes acute or acuminate, strongly nerved, the lower invol.-glume the longest, lower floral glume empty; upper floral glume thm, dorsalls compressed; palea linear-oblong, acummate. Lodicules 2, large, connate below, strongly nerved. Styles long, connute below; stigmas long, penicillate, exserted at the top of the glume. Grun clavate, tipped by the long rigid style, free within the hardened glume and palea, - DISTRIB. Species 4, one in India, three in Australia.

1. Spinifex squarrosus, Linn. Mant. (1771) p. 300. A pilo grey or glaucous squarrose shrub, several feet high and broad, forming an impenetrable thicket; stem as thick as the little finger blow, smooth, solid. Leaves 1-6 in. long, spicading and recurved, smooth, tapering from the base to the tip, concavo-convex, base not dilated, margins scaberulous; sheath 1-1 in. long, smooth, with naked margins; ligule a ridge of stiff hairs. MALY INTIONISCINCL reaching 6-8 in. in diam.; bracts shorter than the spikes, lanceolate, aristately pungent, flat, chartaceous, the midrib very prominent beneath; racemes (male) 1-3 in, long, longer than the stout angular pedancles; rhaches angular. Spikelets 1 in. long, smooth, striw-colored. Glumes 4; lower invol. glume usually shorter than the upper, orate, acute, pungent, conspicuously 7-9-nerved; upper invol.-glume similar but usually longer; floral glumes longer than the invol-glumes, subequal, 5-7-nerved. TI MALE INDORESCENCE reaching 10 in. in diam.; bracts as in the male but smaller; peduncle thickened towards the base. Spikelets !-? in. long, narrowly lanceolate. Glumes 1; lower invol.-glume oblong-Imocolate, many-nerved, scaberulous: upper invol.-glume rather shorter, 7-nerved; lower floral glume empty, the poles 0 or imperfect; upper floral glume oxate-lanceolate, 5-nerved; pilea shorter than the glume.

Decean; common, Dulzell & Gilson; Poona, Jacquement, 107!, Woodraw, Lieba; Lanoli, Lieba; Nasik, Lieba. S. M. Countay: Belgaum, Woodraw. Sinn: Dulzell!—Distata. India (W. Peninsula, Rajputana, Central India). The leaves are used on Mount Abu for making ropes.

2. Pennisetum dichotomum, Delile, Fl. d'Epypte, p. 159, t. 8, fig. 1. Perennial, quite glabrous, bushy; stem distantly dichotomously branched, the branches often fascicled; internodes long, rigid, smooth and polished. Leaves 3-6 by 10-1 in., narrowly linear, tapering to a subulate point, rigid. Racemes 21-5 in. long, cylindric, pale (nearly white); rhachis more or less scaberulous, angular; involucel sessile or nearly so; bristles very numerous, slender, pale, unequal, the longer twice as long as the spikelet, free to the base. Spikelets usually solitary, in. long, lanceolate, acuminate, nearly white. Glumes 4; lower invol.-glume nearly \(\frac{1}{2}\) in. long by \(\frac{1}{1}\), in. broad at the base, lanceolate, acuminate, 1-nerved, hyaline; upper invol.-glume \(\frac{1}{2}\) in. long, lanceolate, acuminate, 5-7-nerved, hyaline; lower floral glume as long as the upper invol.-glume, ovate-lanceolate, cuspidately acuminate, paleate, 5-nerved, the palea nearly as long as the glume, lanceolate, acute; upper floral glume as long as the lower one, ovate-lanceolate, acuminate, cuspidate, 5-nerved; palea I in. long, lanceolate, acuminate. Styles much exserted beyond the spikelets, free nearly to the base, densely plumose in the upper part. Fl. B. I. v. 7, p. 85; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435. Cenchrus ramosissimus, Poir. Eneye. Méthod. v. 6 (1804) p. 51; Dalz. & Gibs. p. 294.—Flowers: Nov.-Dec.

GUJARAT: in hedges, Dalzell & Gibson. SIND: on sand hills, Stocks!, Woodrow; Hyderabad, Cooke!—Distrin. India (Panjáb, N.W. Provinces, W. Peninsula); Afghanistan and westwards to N. Africa.

3. Pennisetum orientale, Rich. in Pers. Syn. v. 1 (1805) p. 72. Perennial, 2-4 ft. high; stem suberect from a stout rootstock, leafy, clothed below with withered sheaths. Leaves 6-12 by 1-3 in., narrowly linear, fluely acuminate, flat, smooth, the margins scaberulous ciliate close to the obtuse or truncate base; sheaths glabrous with ciliate margins; ligule a shortly ciliate line. Racemes reaching as much as 10 in. long; rhachis subterete, pubescent; involucel shortly stipitate, the stipe pubescent; bristles very unequal, the longest about in. long (rarely one may be found 1 in. long), often purplish, scaberulous, the inner ciliate with long hairs below the middle, but naked at the base. Spikelets usually 2-6 (rarely solitary) within the involucel, reaching 1 in. long, on pubescent pedicels. Glumes 4: lower invol.-glume 18-12 in. long, ovate-oblong, obtuse, nerveless, hyaline; upper invol.-glume & in, long, ovate-lanceolate, acuminate; lower floral glume 1 in. long, ovate-lanceolate, 5-nerved, awned, triandrous, the palea 1 in. long, oblong, obtuse, often 2-fid, hyaline; upper floral glume l in. long, membranous, ovate-lanceolate, 5-nerved, awned: palea l in. long, lanceolate, acuminate, with involute margins, sometimes biaristulate at the tip. Fl. B. I. v. 7, p. S6; Trim. Fl. Ceyl. v. 5, p. 171; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 435; Prain, Beng. Pl. p. 1169.—Flowers: July.

Konkan: Stocks !- Distrib. India (W. Himalaya, Panjab, W. Peninsula); N. Africa,

acute. Fl. B. I. v. 7, p. 63; Grah. Cat. p. 240; Trim. Fl. Ceyl. v. 5, p. 174; Woodr. in Journ. Bomb. Nat. v. 13(1901) p. 434; Prain, Beng. Pl. p. 1168; Watt, Dict. Econ. Prod. v. 6, part 3, p. 331.—Flowers: Nov. A valuable sand-binding plant.

KONKAN: Law!; Shrivardhan, Woodrow; sandy shores near Bandra, close to Bombay, Graham. Kanara: Thomson!; Kumpta, Woodrow. Gujarar: near Domas, Cooke!—Distrib. Sandy shores of India; Ceylon, Java, China.

2. PENNISETUM, Pers.

Annual or perennial grasses. Leaves narrow. Inflorescence of spike-like racemes of involucellate clusters of shortly pedicellate spike-lets articulate on a simple rhachis; involucels consisting of unequal scabrid or plumose simple or branched bristles. Spikelets 1-6 in each involucel, persistent on their pedicels, 1-2-flowered, obovoid or lanceolate. Glumes 3 or 4; lower invol.-glume small or 0; upper invol.-glume subequal to the lower floral glume, 5-7-nerved, awned or not, rarely absent; lower floral glume paleate or not, male or empty; upper floral glume sessile, corinceous, 2-sexual or female. Lodicules 2. Stamens 3; anthers linear. Styles long, free or connate below: Grain oblong, free within the hardened glume and palea.—Distrib. Species about 40, in most warm countries.

Bustles of involucel face to the base, slender, not dilated at the base.

Inner bristles of involucel scaberulous, not ciliate.

silky hairs (not villous)

Inner bristles of involuced dilated below, their bases confluent in a coriaceous disk

- 1. P. Alopecuros. 2. P. dichotomum.
- 3. P. orientale.
- 4. P. pedicellatum.
- 5. P. setosum.
- 6. P. cenchroides.

1. Pennisetum Alopecuros, Necs, ex Steud. Syn. Gram. (1855) p. 102. Perennial; stems 2-3 ft. high, stout, erect, densely tufted below, subdistichously branched above; branches strict, erect. Leaves 12-18 by $\frac{1}{10}$ in., corraceous, convolute, glabrous, with usually a tuft of soft hairs at the base; sheaths glabrous or nearly so; lighle a small hairy ring. Racemes spike-like, 5-7 in. long; rhachis flexuous, scaberulous, angular; involuced very shortly pedicellate; bristles very unequal, the longest 2-3 times as long as the spikelet, scaberulous. reaching nearly 3 in. long, lanceolate, acute, solitary. Glumes 4; lower invol.-glume 1 in. long, suborbicular, hyaline; upper invol.glume 1 in. long, lanceolate, acuminate, 3-nerved, hyaline; lower floral glume 1 in. long, lanceolate, acuminate, 7-11-nerved with involute margins; upper floral glume slightly longer than the lower one, lanceolate, acuminate, 5-nerved, with involute margins, 2-sexual; palea lanceolate, as long as the glume. Fl. B. I. v. 7, p. 84; Woodr. in Journ. Bomb. Nat. v 13 (1901) p. 435; Watt, Diet. Econ. Prod. v. 6, part 1, p. 127. Penniseium aureum, Dalz. & Gibs. Bo. Fl. (1861) p. 294.—Flowers: Oct. VERN. Mohl.

Decean: common, Dalzell & Gibson; Poons, Jacquement, 407!, Westrow, Living; Lanoli, Lielwa; Nasik, Liston. S. M. Coentar: Belgaum, Woodrow. Sind: Dalzell! —Distant. India (W. Peninsula, Rajputana, Central India). The leaves are used on Mount Abu for making ropes.

2. Pennisetum dichotomum, Delile, Fl. d'Ejypte, p. 159, t. 8, fig. 1. Perennial, quite glabrous, bushy; stem distantly dichotemously branched, the branches often fascicled; internodes long, rigid, smooth and polished. Leaves 3-6 by $\sqrt{n-1}$ in., narrowly linear, tapering to a subulate point, rigid. Raceines $2\frac{1}{2}-5$ in. long, cylindric, pale (nearly white); rhachis more or less scaberulous, angular; involucel sessile or nearly so; bristles very numerous, slender, pale, unequal, the longer twice as long as the spikelet, free to the base. Spikelets usually solitary, 1 in. long, lanceolate, acuminato, nearly white. Glumes 4; lower invol.-glume nearly \frac{1}{4} in. long by \frac{1}{16} in. broad at the base, lanceolate, acuminate, 1-nerved, hyalino; upper invol.-glumo } in. long, lanceolate, acuminate, 5-7-nerved, hyaline; lower floral glume as long as the upper invol.-glume, ovate-lanceolate, cuspidately acuminate, paleate, 5-nerved, the palea nearly as long as the glume, lanceolate, acute; upper floral glume as long as the lower one, ovate-lanceolate, acuminate, cuspidate, 5-nerved; palea I in. long, lanceolate, acuminate. Styles much exserted beyond the spikelets, free nearly to the base, densely plumose in the upper part. Fl. B. I. v. 7, p. 85; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435. Cenchrus ramosissimus, Poir. Encyc. Méthod. v. 6 (1804) p. 51; Dalz. & Gibs. p. 294.—Flowers: Nov.-Dec.

GUARAT: in hedges, Dalzell & Gib.on. Sind: on sand hills, Stocks!, Woodrow; Hyderabad, Cooke!—Distain. India (Panjab, N.W. Provinces, W. Peninsula); Afghanistan and westwards to N. Africa.

3. Pennisetum orientale, Rich. in Pers. Syn. v. 1 (1805) p. 72. Perennial, 2-4 ft. high; stem subcreet from a stout rootstock, leafy, clothed below with withered sheaths. Leaves 6-12 by 1-3 in., narrowly linear, finely acuminate, that, smooth, the margins scaberulous ciliate close to the obtuse or truncate base; sheaths glabrous with ciliate margins; ligule a shortly ciliate line. Racemes reaching as much as 10 in. long: rhachis subterete, pubescent; involucel shortly stipitate, the stipe pubescent; bristles very unequal, the longest about I in. long (rarely one may be found 1 in. long), often purplish, scaberulous, the inner ciliate with long hairs below the middle, but naked at the base. Spikelets usually 2-6 (rarely solitary) within the involucel, reaching 1 in. long, on pubescent pedicels. Glumes 4: lower invol.-glume 10-12 in. long, ovate-oblong, obtuse, nerveless, hyaline; upper invol.-glume & in. long, ovate-lanceolate, acuminate; lower floral glume } in. long, ovate-lanceolate, 5-nerved, awned, triandrous, the palea 1 in. long, oblong, obtuse, often 2-fid, hyaline; upper floral glume k in. long, membranous, ovate-lanceolate, 5-nerved, awned; palea k in. long, lanceolate, acuminate, with involute margins, sometimes biaristulate at the tip. Fl. B. I. v. 7, p. 86; Trim. Fl. Ceyl. v. 5, p. 171; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 435; Prain, Beng. Pl. p. 1169.—Flowers: July.

Konnan: Stocks!-Distrib. India (W. Himalaya, Panjab, W. Peninsula); N. Africa.

4. Pennisetum pedicellatum, Trin. in Mem. Acad. Pétersb. sér. 6. v. 3, part 2 (1835) p. 184. Annual; stems 1-3 ft. long, branched from the base and above, leafy. Leaves 6-10 by 1-8 in., flat, flaccid, glabrous or sparsely hairy; sheaths glabrous; ligule a shortly ciliate membrane. Racemes cylindric, 2-5 in. long, dense-flowered; rhachis glabrous or nearly so, notched; involucel sessile; outer bristles few. slender, short, about \(\frac{1}{8} \) in. long; inner bristles numerous, the longest reaching & in. long (or more), densely villous below the middle, unequal. usually pale, free to the base. Spikelets 1 in. long, usually solitary within the involucel, shortly pedicellate. Glumes 4; lower invol.glume very small, woolly; upper invol.-glume oblong-lanceolate, apiculate, & in. long, 7-nerved, hyaline; lower floral glume & in. long, oblong, truncate, 3-toothed, 5-nerved, hyaline; upper floral glume ovate-oblong, obtuse, with a fimbriately ciliate tip, rather shorter than the lower floral glume, coriaceous, smooth, shining; palea as long as the glume, lanceolate, toothed. Fl. B. I. v. 7, p. 86; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435; Prain, Beng. Pl. p. 1169. Pennisetum lanuginosum, Hochst. in Flora, v. 25, part 1 (1842), Beibl. i. p. 133; Lisboa, in Journ. Bomb. Nat. v. 5 (1891) p. 339.—Flowers: Oct.

Decan Lisboa Guinrat: Lisboa; Rajkot (Kathiawar), Woodrow,—Distrib. India (Behar, Rajputana, W. Peninsula), Tropical Africa.

5. Pennisetum setosum, Rich. in Pers. Syn. v. 1 (1805) p. 72 (circlud. syn.). Annual; stem erect, often fastignately branched at the nodes, green or purplish. Leaves 6-10 by $\frac{1}{4} - \frac{3}{8}$ in., linear, finely acuminate, glabrous or hairy; sheaths glabrous; ligule a line fringed with rather long soft hairs. Racemes 2-4 in. long, usually purplishbrown; rhachis glabrous, notched; involucel sessile; bristles unequal, the outer not ciliate, short, about $\frac{1}{8}$ in. long, the inner longer, ciliate below the middle with long silky hairs (1 of the inner bristles is often much longer than the others, reaching \ in., the others \frac{1}{2} in. long). Spikelets $\frac{1}{6}$ in. long, solitary within the involucel. Glumes 3 or 4; lower invol.-glume minute or wanting; upper invol.-glume ; in. long, ovate-oblong, gradually or suddenly cuspidate, 5-nerved, hyaline; lower floral glume hin. long, oblong, obtuse, with 2 subobtuse lateral and an acute median tooth at the apex, 5-nerved, paleate, male, the palea $\frac{1}{10}$ in. long, narrowly oblong, hyaline; upper floral glume $\frac{1}{10}$ in. long, ovate-oblong, truncate, fimbriately ciliate at the tip, coriaceous, amooth and shining; palea as long as the glume, oblong, truncate, toothed or ciliate at the tip Anthers nearly 12 in. long. Styles long, reaching in., much exserted beyond the spikelet. Fl. B. I. v. 6, p. 87; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435; Prain, Beng. Pl. p. 1169.—Flowers: Dec.

Sind: Haderabad, Woodrow.—Distrin India (Behar, W. Bengal, Upper Gangetie plain, W. Peninsula); Tropical Africa and America.

6. Pennisetum cenchroides, Rich. in Pors. Syn. v. 1 (1805) p. 72. Perennial; stems tufted, 6-18 in. long, erect, or decumbent and muchbranched from the base, stout or slender, leafy, or ascending from a branched often nodose rootstock. Leaves 4-10 by $\frac{1}{9}-\frac{1}{7}$ in., linear, tapering to a fine point, glabrous or hairy. Racemes cylindric, dense, 1-1 by $\frac{1}{3}-\frac{1}{2}$ in., pale or purplish; rhachis finely scaberulous; involucels

subsessile; outer bristles slender, short, not ciliate; inner bristles about $\frac{2}{5}$ in, long (1 bristle conspicuously longer and stouter than the others, reaching $\frac{1}{2}$ in, long or more), dilated and connate into a ring at the base. Spikelets $\frac{1}{5}$ —in, long, oblong-lanceolate, 3-1 in each involucel. Glumes 4; lower invol.-glume $\frac{1}{10}$ in, long, ovate-lanceolate, acute, faintly 1-nerved, hyaline; upper invol.-glume $\frac{1}{5}$ in, long, ovate, acuminate, 1-nerved, hyaline; lower floral glume $\frac{1}{5}$ —in, long, ovate-lanceolate, cuspidately acuminate, 3-5-nerved, paleate, usually male, the palea narrowly lanceolate, as long as the glume; upper floral glume as long as the lower one, lanceolate, 3-5-nerved; palea lanceolate, as long as the glume. Fl. B. I. v. 7, p. 88; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 435; Watt, Diet. Econ. Prod. v. 6, part 1, p. 127.—Flowers: Dec.

DECCAN: Lishea. Gruanar: Lishea; Rajkot (Kathiawar). Weedrew. Sind: Jemadar ka Landa, near Karachi, Stocks!—Distrib. India (Kashiair, Upper tiangetic plain, W. Peninsula); Sicily, Tropical Africa, and the Canaries.

Pennisctum Typhoideum, Rich. in Pers. Syn. v. 1 (1805) p. 72. An annual plant widely cultivated in India, probably a native of Africa, growing to a height of 5 or 6 ft. with racemes sometimes reaching a

foot long.

In the Bombay Presidency more than four millions of acres are annually grown, and in many parts it forms the staple food of the people. It is so well known by its native name Bojci that description is unnecessary. Fl. B. I. v. 7, p. 82; Woodr, in Johrn. Bomb. Nat. v. 13 (1901) p. 435; Prain, Beng. Pl. p. 1169; Watt, Diet. Econ. Prod. v. 6, part 1, p. 127. Holcus spicatus, Linn. Syst. ed. 10, p. 1305; Grah. Cat. p. 238; Dalz. & Gibs. Suppl. p. 99.

3. CENCHRUS, Linn.

Characters of *Pennisctum*, but involucels composed of subulate hard spines without filiform tips, connate below into a short coriaceous cup which is surrounded by erect or squarrose bristles.—Distrib. Species few, tropical and subtropical.

1. Cenchrus biflorus, Roxb. Fl. Ind. v. 1 (1832) p. 233. Annual?; stem 6-24 in. long, simple. Leaves 3-10 by $\frac{1}{6}$ - $\frac{3}{2}$ in., linear-lanceolate, finely acuminate, glabrous or hairy; sheaths glabrous or nearly so, ciliate near the mouth; ligule a pubescent ring. Racemes 2-4 in. long, solitary, cylindrie; rhachis angular, smooth; involucel usually 2-flowered, rounded at the base; bristles thick, lanceolate-subulate, ercet, dorsally flattened, the outer very short, about $\frac{1}{16}$ - $\frac{1}{10}$ in. long, glabrous, the rinner $\frac{1}{3}$ in. long, glabrous or puberulous. Spikelets $\frac{1}{6}$ in. long, subglobose. Glumes 4; lower invol.-glume $\frac{1}{10}$ in. long, ovate, acuminate, very thin, hyaline, 1 (rarely 3)-nerved; upper invol.-glume $\frac{1}{6}$ in. long, ovate, apiculate, 5-nerved, hyaline; lower floral glume scarcely shorter than the upper invol.-glume, ovate, acute, 5-7-nerved, paleate, the

palea $\frac{1}{5}$ in. long, oblong, obtuse; upper floral glume as long as the lower, ovate, obtuse. Anthers $\frac{1}{10} \cdot \frac{1}{5}$ in. long. Styles free almost to the base. Grain $\frac{1}{12}$ by $\frac{1}{10}$ in., orbicular-oblong, compressed, smooth, shining, pale brown. Fl. B. I. v. 7, p. 89; Grah. Cat. p. 234; Dalz. & Gibs. p. 294; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435.

Gujarat: Abmedabad, Cooke!; Morvi (Kathiawar), Beck ex Woodrow. Sind Kurachi, Woodrow; Jemadar ka Landa near Karachi, Stocks!—Distrib. India (Panjáb, Rajputana, W. Peninsula); Beluchistan, Arabia, Africa.

2. Cenchrus catharticus, Delile, Cat. Hort. Monsp. (1838); Linnea, v. 13 (1839), Litt. p. 103. Quite glabrous; stems tufted, geniculately ascending, branched from the base, leafy. Leaves 1-5 by $\frac{1}{8}$ $\frac{1}{4}$ in., linear-lauceolate, finely acuminate; sheaths glabrous; ligule a bairy ring. Racemes 1-6 in. long, usually more or less enclosed in the uppermost leaf-sheaths; rhachis angular, glabrous, flexuous; involucels with a turbinate base; bristles hard, subulate, sharply pungent, the outermost short, glabrous or nearly so, spreading or reflexed, the inner ciliate at the base, subulate, subcreet or squarrosely spreading, dorsally grooved, reaching & in. long. Spikelets shorter than the inner bristles. Glumes 4; lower invol.-glume ovate-lanceolate, acute, hyaline, 1 in. long; upper invol.-glume rather more than \(\frac{1}{6} \) in. long, 5-nerved, hyaline; lower floral glume ovate, acuminate, as long as the upper invol.-glume, 5-nerved, paleate, hyaline, the palea 1 in. long, narrowly lanceolate, acute, hyaline; upper floral glume as long as the lower one, cuspidately acuminate, 5-nerved, membranous; palea ovate, acuminate, membranous, as long as the glume. Grain 10 in. long, ovoid-oblong, compressed, pale, rugulose. Fl. B. I. v. 7, p. 90; Watt, Dict. Econ. Prod. v. 2, p. 246.

GUJARAT: Perim Island, at the mouth of the Narbada river, Raoji!-Distrib. India (Panjáb, W. Peninsula); Arabia, Tropical Africa.

4. SETARIA, Beauv.

Annual (rarely perennial) grasses of various habit; nodes of stem glabrous or hairy; ligules a ridge of hairs. Spikelets subsessile in contracted, cylindric or pyramidal terminal panicles, articulate on a very short pedicel, subtended by 1 to many persistent scabrid or barbed bristles (modified branchlets) which often form a one-sided involucel, but are sometimes present and absent in the same inflorescence. Glumes 4; lower invol.-glume usually much the smallest, 3-5-nerved, membranous; upper invol.-glume 5-7-nerved; lower floral glume more or less exceeding and resembling the upper invol.-glume, usually paleate; upper floral glume coriaceous or crustaceous, 5-nerved, paleate, the palea about equalling the glume. Lodicules 2, broadly cuneate. Stamens 3. Styles distinct; stigmas laterally exserted. Grain tightly enclosed by the bardened glume and palea, oblong or ellipsoid.—Distrib. Tropical and temperate; species about 40.

1. Setaria plicata, T. Cooke. Perennial; stem 1-8 ft. long, erect or ascending from a woody branching rootstock, stout, leafy; nodes strigillose; internodes 2-6 in. long. Leaves 6-24 by 1-3 in., linearlanceolate, finely acuminate, chartaceous, glabrous or sparsely hairy, plicate between the numerous veins, base narrow; sheaths smooth or hispid, the margins naked, or ciliate near the top only; ligule of long hairs. Panicle 1-2 ft. long, contracted, nodding; rhachis stout, angular, scabrid; branches usually alternate, distant (the lower 3-1 in. long), filiform, subcreet, bearing short capillary few-flowered branchlets and bristle-like flowerless ones. Spikelets 1 in. long, sessile or shortly pedicellate, ovoid, acute or apiculate, glabrous. Glumes 4: lower invol.-glume broadly ovate, obtuse, 5-nerved, membranous, 1 as long as the spikelet; upper invol.-glume rather more than I as long as the upper floral glume, ovate, obtuse, 7-nerved, membranous; lower floral glume slightly longer than the upper, ovate, shortly apiculate, membranous, empty, paleate or not, 5-nerved, the palea when present small, hyaline, narrowly ovate, acute; upper floral glume crustaceous, ovate-oblong, acute or shortly apiculate, slightly transversely striate. pale-yellow, with strongly involute margins; palea ovate, acute, nearly as long as the glume, faintly transversely striate and with incurred membranous margins. Panicam plicatum, Lam. Illustr. v. 1 (1791) p. 171; Hook, f. Fl. B. I. v. 7, p. 55; Trim. Fl. Ceyl, v. 5, p. 157; Jacq. Eelog. Gram. v. 1, t. 1; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1176. P. nepalense, Spreng, Syst. v. 1 (1825) p. 321; Dalz. & Gibs. p. 291.-Flowers: Nov.

Konkan: western side of the Ghâts, Dalzell & Gibson; Parel (Bombay), Liebox. Sometimes cultivated as an ornamental grass in gardens.—Distant. Throughout the moister hilly parts of India; Coylon, Malay Peninsula, China, Malay Islands.

2. Setaria rhachitricha, T. Cooke. Annual; stems tufted, erect. 8-24 in. long, glabrous; nodes softly pubescent. Leaves 3-8 by 4-1 in., oblong-lanceolate, tapering to both ends, finely acuminate, flaccid, glabrous or sparsely hairy, many-veined, plicate between the veins; sheaths with ciliate margins; ligule a tuft of hairs. Paniele 2-6 in. long, pyramidal; rhachis of panicle angular, hairy; branches 1-11 in. long, alternate, spreading, with bristle-like flowerless scabrid branchlets at the base of the spikelets, much longer than the spikelets, 1 (rarely 2) to each pedicel; rhachis of branches angular, sparsely hairy. Spikelets numerous, glabrous, in long, densely or loosely imbricate, orate, subacute, dorsally compressed, pale with green nerves, articulated on short scaberulous pedicels. Glumes 4; lower invol-glume orbicularoblong, Is in long, hyaline, obscurely nerved or nerveless; upper invol.-glumo 10 in. long, broadly ovate, subobtuse, 5-nerved, thinly membranous; lower floral glume about equal to the upper invol.-glume. similar, 5-nerved, epaleate; upper floral glume elliptic-oblong, subscute. coriaccous, white, transversely striate, 1 in. long, with strongly involute margins; palea as long as the glume, elliptic, with involute membranous margins. Panicum rhachitricham, Hochst. in Flora, v. 27 (1841) p. 254;

- Hook, f. Fl. B. I. v. 7, p. 56; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1176.—Flowers: Oct.
- S. M. Country: Londa, Gammio ex Woodrow.—Distrib. India (Subtropical Himalaya, W. Pennisula); Tropical Africa.

I have not seen any specimens from the Bombay Presidency; there are none in Herb. Kew.

3. Setaria glauca, Beauv. Agrost. (1812) p. 51. Stem 1-2 ft. high, erect or ascending, simple or branched; nodes glabrous, the lower rooting. Leaves 4-12 by 3 in., linear, finely acuminate, flat, glabrous or sparsely hairy, with scabrid margins, base usually rounded; sheaths smooth; ligule a ridge of hairs. Inflorescence a cylindric densely flowered spike-like raceme 1-5 in. long; bristles of involucel 6-12, pale or reddish-brown, 1-1 in. long, with very short erect or spreading teeth. Spikelets numerous, closely set along the rhachis of the spike, 1 in. long, ellipsoid, glabrous. Glumes 4; lower invol.-glume less than as long as the spikelet, broadly ovate, often shortly apiculate, 3nerved, hyaline; upper invol.-glume slightly longer than the lower, broadly ovate or suborbicular, hyaline, 5-nerved; lower floral glume thinly membranous, as long as the upper one, 5-nerved, paleate, empty or male, the palea hyaline; upper floral glume coriaceous, broadly elliptic, obtuse, dorsally convex, transversely rugose, pale. Fl. B. I. v. 7, p. 78; Dalz. & Gibs. p. 293; Trim. Fl. Ceyl. v. 5, p. 162; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435; Prain, Beng. Pl. p. 1170; Watt, Dict. Econ. Prod. v. 6, part 2, p. 546.—Flowers: Oct. Vern. Kolára.

Konkan: Stocks!; Thána, Lisboa. Diccin: Mahableshwar common, Dalzell & Gibson, Woodrow, Cooke!; Nasik, Lisboa. Gujarat: Baroda, Cooke!—Distrin. More or less throughout India; Ceylon, most warm temperate and tropical regions.

4. Setaria intermedia, Roem. & Schult. Syst. v. 2 (1817) p. 489. Stem 2-3 ft. long, slender, erect or ascending; nodes glabrous, the lower often rooting. Leaves 2-9 by 1-3 in., linear-lanceolate, finely acuminate, thin, flat, sparsely bairy on both surfaces, with scaberulous margins, base narrow; sheaths long, smooth, the mouth villous, the margins ciliate especially in the upper part. Panicle 4-6 in. long, narrowly pyramidal; rhachis glabrous, grooved; branches short, distant below, rather crowded above, dense-flowered; bristles of involucel 3-6, about 4 in. long, very slender, flexuous, studded with minute creek Spikelets 12 16 in. long, ovoid, subacute. Glumes 4; teeth, pale. lower invol.-glume orbicular-oblong or ovate, about & as long as the spikelet, hyaline, faintly 3-nerved; upper invol.-glume about & as long as the spikelet, broadly ovate, subacute, hyaline, 5-nerved; lower floral glume about equalling the upper, broadly ovate, thinly membranous, 5-nerved, paleate, empty, the palea hyaline; upper floral glume broadly ovate or suborbicular, acute, coriaceous, very concave, transversely rugulose all over, yellowish-brown; palen elliptic, subacute. Fl. B. I. v. 7, p. 79; Trim. Fl. Ceyl. v. 5, p. 163; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435; Prain, Beng. Pl. p. 1170; Watt, Diet. Econ. Prod. v. 6, part 2, p. 546.—Flowers: Aug.-Oct. VERN. Pandar.

Tolerably common throughout the Presidency. Konkan: Law ex Woodrow. Dican: in cultivated fields about Poona, Jacquemont, 355! S. M. Countar: Belgaum, Ritchto, 839!—Distrib. Throughout India; Ceylon, temperate and tropical regions.

5. Setaria verticillata, Beauv. Agrost. (1812) p. 51. Annual: stems erect or ascending, 1-3 ft. long, stout or alender, leafy, more or less branched, glabrous. Leaves 3-10 by \(\frac{1}{4}-\frac{7}{4}\) in., thin, flat, glabrous or sparsely hairy and scaberulous, linear or linear-lanecolate, tapering to a fine point, base usually narrow; sheaths smooth, striate; ligule a fringe of hairs. Paniele 1-5 in. long, erect or curved, spike-like, cylindric or oblong, coarsely bristly; bristles of the involuced 1 or few, 1-1 in. long, 1 in. long, ellipsoid, obtuse, glabr invol.-glume i, in long, ovate, acute, hyaline, faintly 3-nerved; upper invol-glume about as long as the spikelet, ovate, subacute, thinly membranous, 5nerved; lower floral glume similar to the upper invol.-glume, 5-nerved, empty, paleate or not, the palea when present hyaline, very small; upper floral glumo elliptic-oblong, plano-convex, subobtuse, coriaceous, straw-colored, faintly striatulate and with incurved margins; palea as long as the glume, coriaceous, elliptic, faintly striatulate. Fl. B. I. v. 7, p. 80; Dalz. & Gibs. p. 294; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435; Trim. Fl. Coyl. v. 5, p. 163; Prain, Beng. Pl. p. 1170; Watt, Dict. Econ. Prod. v. 6, part 2, p. 549.—Flowers: Dec. Vens. Dangani.

Konkan: Stocks: Gujanar: Baroda, Woodrow; Morvi (Kathiawar), Woodrow, Sind: Stocks, 649!—Distrib. Throughout India; Ceylon, temperate and tropical regions.

Sctaria italica, Beauv. Agrost. (1812) p. 51. Annual; stems 2-5 ft. long, usually branched, tufted, rooting towards the base. Panicle dense, spike-like; bristles few, smooth or barbed. The Italian Millet, extensively cultivated as a food-grain throughout India. According to Watt (Dict. Econ. Prod. v. 6, part 2, p. 548), about 330,000 acres were under cultivation in the Bombay Presidency during the year 1886-87. Fl. B. I. v. 7, p. 78; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435; Prain, Beng. Pl. p. 1170. Panicum italicum, Linn. Sp. Pl. (1753) p. 56; Grab. Cat. p. 237; Dalz. & Gibs. Suppl. p. 98.—Vens. Rala.

5. CHAMÆRAPHIS, Br.

Glabrous marsh or aquatic grasses. Leaves narrowly linear-lanceolate. Spikelets 1-2-flowered, subsessile and subsecund on the branches of a simple panicle which are produced as awn-like bristles beyond the ultimate spikelet, obscurely articulate but persistent on their short obconic pedicels, narrowly lanceolate, terete, green. Glumes 4; lower invol.-glume very small, suborbicular, hyaline, white, nerveless; upper invol.-glume longer than the lower floral glume, membranous, green, narrowly lanceolate, acuminate or narrowed into a rigid awn, 9-11nerved; lower floral glume lanceolate, acute or aristately acuminate, paleate, 7-nerved, male, the palea smaller than the glume, hyaline; upper floral glume much smaller than the lower, stipitate, female, oblong or ovate-oblong, acute, that, thinly coriaceous, nerveless, the palea hyaline, as broad as the glume, acute, nerveless. Lodicules cuneate. Stamens 3; anthers short. Styles free; stigmas laterally exserted. Grain minute, oblong, compressed, free within the subcoriaceous glume and hyaline palea. DISTRIB. Tropical Asia and Australia; species 5 or 6.

1. Chamæraphis spinescens, Poir. Encyc. Method. Suppl. v. 2 (1811) p. 189. Forming floating much-branched masses with leafy ascending stems 1-3 ft. long. Leaves 1-3 by 1 in., flat, acuminato, narrowly linear-lanceolate, smooth or scabrid, base narrowed; sheaths long, loose, with naked margins; ligule a ridge of minute hairs. Panicle 2-4 in. long, shortly pedunculate, more or less contracted; rhachis angular, sulcate; branches filiform, angular, grooved, flexuous, few- or many-flowered, the lower 1-2 in. long, the awn-like tips $\frac{1}{3}$ in. long. Spikelets (including their awn) 1-1 in. long, subsessile. Glumes 4; lower invol.-glume scarcely 10 in. long, orbicular or subquadrate, usually rounded at the apex, hyaline; upper invol.-glume 1-1 in. long (including the awn), lanceolate, setosely scabrid on the sides, membranous, 9-11nerved, with a long scabrid awn which is sometimes as long as the body of the glume; lower floral glume shorter than the upper invol.glume, finely acuminate or awned, 7-nerved, male, paleate, membranous. the palea hyaline, smaller than the glume, linear-oblong, subacute; upper floral glume about Ti in. long, ovate-lanceolate, acute, female, nerveless, the palea hyaline. Fl. B. I. v. 7, p. 62; Trim. Fl. Coyl. v. 5, p. 165; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1171.—Flowers: Sept.

Konkan: Wangni, Woodrow.—Distrib. India (Rajputana, Bengal, W. Peniusula); Ceylon, China, Malaya, Australia.

I have seen no specimens from the Bombay Presidency; there are none from that Presidency in Herb. Kew.

6. ISACHNE, Br.

Perennial grasses. Leaves ovate or linear-lanceolate. Spikelets small or minute, loosely paniculate, not or obscurely articulate with the pedicel, subglobose or obovoid, 1-2-flowered. Glumes 4, the 2 lower often separately deciduous, thinly coriaceous or membranous, strongly nerved; invol.-glumes subequal, convex, empty; the 2 floral glumes both paleate, equal and convex, or the lower larger and flatter; lower floral glume male or neuter; upper floral glume jointed and often stipitate on the very short rachilla, hemispheric, female or hermaphrodite. Lodicules most minute. Stamens usually 3 (rarely 4 or 6). Styles 2, free; stigmas short, plumose, exserted at the top of the spikelet. Grain free within the hardened glume and palea.—Distrib. Species about 25, tropical and subtropical.

1. Isachne Lisboæ, Hook. f. Fl. B. I. v. 7 (1896) p. 22. A low plant 6 in. high; stems creeping, with long wiry roots, then ascending, rather stout, leafy. Leaves 1-2 by $\frac{2}{3}$ in., recurved, thin, oblong-lancolate, acute, ciliate on the margins with long slender hairs, closely and

conspicuously nerved; sheaths glabrous or sparsely hairy; ligule 0. Panicles 1-2 in long; branches of the panicle (spikes) \(\frac{1}{2}\)-\(\frac{1}{2}\) in long, horizontally spreading. Spikelets \(\frac{1}{20-\frac{1}{2}}\) in in diam., secund on the lower side of the branches, hairy with bulbous-based hairs; pedicels short, triquetrous, hairy. Glumes 4; lower and upper invol. glumes equal, broadly ovate or suborbicular, acuminate, conspicuously 5-nerved, longer than the floral glumes, hairy; floral glumes orbicular, equal, smaller than the invol.-glumes, concave, glabrous. Palea with incurved flaps. Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433.—Flowers: Sept.-Oct.

Decean: Panchgani, Raoji!; Mahableshwar, Cooke!, Lisbea.—Distrib. Bombay Presidency, apparently endemic.

2. Isachne elegans, Dalz. in Dalz. & Gibs. Bo. Fl. (1861) p. 291. A small elegant grass 8-12 in. high; stems densely tufted, soft, geniculate below, and with slender fibrous roots. Leaves 2-6 by \(\frac{1}{2}\)-\frac{1}{4} in., linear-lanceolate, acute, striate, with thickened and glabrous or minutely serrulate margins; sheaths bristly at the mouth. Panicle 3-5 in. long, glabrous; branches slender, alternate, undulating, \(\frac{1}{2}\)-1 in. long, smooth; pedicels short, glabrous. Spikelets \(\frac{1}{10}\)-\frac{1}{2} in. in diam., hispid, with 2 perfect flowers. Glumes 4; invol.-glumes equal, similar, inconspicuously many-nerved, broadly ovate or suborbicular, with red margins, hairy; floral glumes as long as the invol.-glumes, hemispheric, puberulous. Anthers \(\frac{1}{2}\) in. long, brownish-yellow. Fl. B. I. v. 7, p. 23; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433.—Flowers: Sept. Vens. Danda.

Konkan: Pen, in inundated land, Daledl! Deccan: margins of rivulets in the Deccan, Daledl & Gibson; Poona, Woodrow; Lanoli, Woodrow, 175!; between Poona and Karli, Jacquemont, 550!—Distain. Bombay Presidency apparently endemic.

3. Isachne australis, R. Br. Prodr. (1810) p. 196. Stem slender, erect or ascending from a creeping rootstock, 8-18 in. high, leafy, smooth, branched below; nodes glabrous. Leaves 1-21 by 1-1 in., linear-lanceolate, acuminate, tlat, multistriate, scaberulous on both surfaces, base rounded; sheaths 1-11 in. long, striate, the margins above the middle densely ciliate; ligule a tuft of long slender erect white Panicle 1-4 in. long; branches alternate, flexuous, erect or spreading, up to 11 in. long, sometimes divided; rhachis angular, smooth. Spikelets 15 77 in. in diam., globose, sessile or pedicellate, green or violet; pedicels sometimes 1 in. long, capillary. Glumes 4; invol.glumes similar, broadly ovate or suborbicular, obtuse, concave, membranous, 7-nerved, glabrous or with a few bristles; floral glumes usually unequal, the lower longer and thinner than the upper, ovate, obtuse, nerveless; upper floral glume hemispheric, coriaceous, ciliolate. Palea glabrous. Anthers 15 in. long, red. Fl. B. I. v. 7, p. 24; Trim. Fl. Cevl. v. 5, p. 128; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433; Prain, Beng. Pl. p. 1172.—Flowers: Oct. VERS, Danca,

DECCAN: Poons, Listen; Mahableshwar, Woodrow; Nasik, Listen.-Gujabat: Listen.-Distrib. Throughout India; Ceylon, Australia, New Zealand.

4. Isachne miliacen, Roth, Nov. Pl. Sp. (1821) p. 58. A slender plant, variable in size, 6-10 in. high; stems very slender, prostrate,

widely creeping and branched below, then ascending. Leaves small. rather distant, $\frac{1}{2}-1\frac{1}{2}$ by $\frac{1}{5}-\frac{1}{3}$ in., ovate, acute, glabrous or sparsely hairy. base rounded. Panicle small, lax-flowered. Spikelets 10 in. in diam., globose, few and distant; pedicels short or long, capillary. Invol.-glumes orbicular-oblong, almost hemispheric, often hispid with long hairs, obscurely 7-nerved; lower floral glume rather longer than the upper, ovate-oblong, membranous, male; upper floral glume smaller. hemispheric, coriaceous, female. Palea glabrous. Fl. B. I. v. 7, p. 25; Trim. Fl. Ceyl. v. 5, p. 128; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433; Prain, Beng. Pl. p. 1172.

Seems to be but a small state of I. australis with shorter leaves, laxer

panicles, and smaller spikelets.

KONKAN: Woodrow. DECCAN: Lanoli, Woodrow!-Distrib. More or less throughout India; Ceylon, China, Malay and Pacific Islands, S. America.

7. TRICHOLÆNA, Schrad.

Erect tufted perennial (rarely annual) grasses. Leaves narrow; ligule a fringe of hairs. Spikelets 1-2-flowered, articulate on their pedicels, paniculate, laterally compressed, clothed with long silky hairs. Glumes 3 or 4; lower invol.-glume somewhat remote from the upper, often reduced to a minute scale or obsolete; upper invol.-glume membranous, emarginate or muticous, or finely mucronate or aristate from the sinus, 5-nerved, usually hairy; lower floral glume like the upper invol.-glume. male or barren, with a hyaline 2-nerved subequal palea; upper floral glume much smaller than the lower, thinly chartaceous, glabrous, shining, obtuse or emarginate, obscurely 5-nerved, 2-sexual. Lodicules 2, small. Stamens 3. Styles free.—Distrin. Species many, chiefly African.

Spikelets up to \(\) in, long; lower invol.-glume minute or obsolete; Spikelets reaching & m. long; lower invol-glume to in. long;

1. Tricolæna Teneriffæ, Parlat. in Webb & Berth. Phyt. Canar. v. 3, part 2 (1848) p. 425. Perennial; stems many from a woody rootstock, geniculate below, slender, rigid. Leaves 11-3 by 10-1 in., narrowly linear-lanceolate, finely acuminate, convolute, rigid, glabrous; sheaths glabrous; ligule a narrow softly hairy ridge. Inflorescence of slender erect panicles 21-41 in. long; branchlets and pedicels capillary. Spikelets up to 1 in. long, clothed with silky hairs. Glumes 3 (rarely 4); lower invol.-glume minute or obsolete; upper invol.-glume 1 in. long, ovate, acute, densely silky; lower floral glume 1 in. long, ovate, acute, apiculate, paleate, the palea narrowly oblong, subobtuse, hyaline; upper floral glume 10 in. long, ovate-oblong, obtuse, coriaceous, shining; palea as long as the glume, oblong-lanceolate, subacute. Anthers $\frac{1}{10}$ in. long, narrowly linear. Stigmas $\frac{1}{10}$ in. long, exserted, sessile or nearly so, plumose. Fl. B. I. v. 7, p. 65; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434,—Flowers: Aug.

Sind: Stocks, 6391; Thano-Bullo-Khan, Woodrow,-Distrain, India (Panjab, W. Peninsula); westward to Sicily and N. Africa.

There is but one specimen (4 very poor one) from Sind in Herb. Kew. collected by

Stocks!

2. Tricholæna Wightii, Necs, ex Steud. Syn. Gram. (1855) p. 93. Stems 6-18 in. high, tufted, stout or slender. Leaves 1-6 by 1-1 in., linear, finely acuminate, flat, glabrous or hairy; sheaths glabrous or hairy with bulbous-based hairs; ligule a hairy line. Inflorescence a narrow paniele 2-5 in. long; branchlets and pedicels capillary, flexuous. Spikelets variable in size, sometimes exceeding 3 in. long (including the awns), silky-hairy. Glumes 4; lower invol.-glume 15 in. long, linear, obtuse, distant from the others, strongly bearded at the base; upper invol.-glume ovate-lanceolate, tumid at the base, obtuse or subacute, silky-hairy, the midnerve produced from the back into a capillary awn nearly & in. long; lower floral glume similar to the upper invol.-glume, with a similar awn, silky-hairy, paleate, male, the palea narrow, hyaline; upper floral glume 10 in. long, elliptic-oblong, obtuse, concave, smooth, thin, 2-sexual; palea as long as the glume. Anthers 10 in. long. Stigmas In in. long, with distinct styles free to the base or nearly so. Fl. B. I. v. 7, p. 65; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434.—Flowers: Sept. VERN. Chota-Kagli.

Deccau: Malbargad, Woedrow; Poona, Weedrow; Malableshwar, Lieber; Panchgani, Lieber. S. M. Corntar: Badami, Weedrow, 23!—Distrin, India (Rajputana, W. Peniusula); Arabia, Capo Verd Islands.

8. AXONOPUS, Beauv.

Annual or perennial grasses of various habit. Leaves subradical; ligules membranous, ciliate or reduced to a ciliate rim. Panicles consisting of digitate or more or less whorled slender or stout often spikelike racemes. Spikelets ovoid or oblong, mucronate or awned, solitary, 2-nate or fasciculate, 2-flowered, articulate on thin pedicels, erect. Glumes 4; lower invol.-glume shorter than the spikelet, hyaline. acuminate or aristate, 3-nerved; upper invol.-glume as long as the upper floral glume, ovate, 5-nerved, the lateral nerves marginal and hairy or villous; floral glumes subequal; lower oblong-ovate, 5-nerved, paleate, male, the palea small, 2-partite; upper floral glume 2-sexual, ovate or oblong, narrowed into a terminal awn, thinly coriaceous; palea Lodicules flabelliform. Stamens 3; anthers linear. oblong-elliptic. Styles free; stigmas linear, laterally exserted, shortly penicillate. Grain oblong, free within the hardened glume and palea. Distrib. Species 3, one from South Africa and the Mascarene Islands to India and Australia, one in the Indo-Malayan region, the third in Tropical Africa.

1. Axonopus cimicinus, Beauv. Agrost. (1812) p. 12. A tufted grass; stems 1-2 ft. long, erect, or decumbent at the base; nodes hairy. Leaves 1-3 by $\frac{2}{3} - \frac{1}{5}$ im, ovate-lanceolate from a broad cordate base, acute, flat, glabrous or hairy, ciliate on the margins with stiff bulbous-based hairs; sheaths glabrous or hairy; ligule of short hairs. Inflorescence in spike-like racemes, 3-10 on the top of a slender smooth glabrous peduncle 2-6 in, long, with sometimes a fascicle of 2 or more lower down on the peduncle; peduncle naked in the lower part; rhachis of raceme angular, scaberulous, slender. Spikelets (including a slender scaberulous awn about $\frac{1}{2}$ in, long) $\frac{1}{4}$ in, long, subsecund, solitary or 2-(rarely 3-)nate, erect, readily disarticulating from the pedicel; pedicels unequal, scaberulous, cupular at the tip. Glumes 4; lower invol.-glume

rather more than $\frac{1}{10}$ in. long, narrowly ovate-lanceolate, aristately acuminate, hyaline, with 3 slender green nerves, of which the 2 lateral arch to join the midrib below the tip; upper invol.-glume $\frac{1}{2}$ in. long, broadly ovate, cuspidately acuminate, thinly membranous, 5-nerved, the 3 central nerves slender, green, the 2 lateral nerves marginal, bristly with long coarse purplish hairs which reach $\frac{1}{10}$ in. long; lower floral glume $\frac{1}{2}$ in. long, ovate-oblong, obtuse, male, paleate, the palea small, 2-partite; upper floral glume $\frac{1}{4}$ in. long (or more), including the awn, which is nearly as long as the glume, ovate, acute, coriaceous, often faintly ciliolate and with slightly incurved margins; palea as long as the glume, coriaceous, elliptic-oblong, subobtuse. Fl. B. I. v. 7, p. 64; Trim. Fl. Ceyl. v. 5, p. 166; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1173. Urochloa cimicina, Kunth, Revis. Gram. (1829) v. 1, p. 31; Dalz. & Gibs. p. 289.—Flowers: Oct.

KONKAN: Stocks! S. M. Country: Dharwar, Woodrow; Badami, Woodrow!

9. OPLISMENUS, Beauv.

Slender leafy weak grasses; stems creeping below; branches ascending. Leaves ovate-lanceolate, acuminate, thin, flat; margins scaberulous. base narrow, auricled on one side; ligule a ridge of long hairs. Spikelets solitary or 2-nate, disarticulating at the base, in small clusters or in spike-like more or less secund racemes along a common axis, subterete. Glumes 4; invol.-glumes similar, more or less subequal. herbaceous to membranous, 3-7-nerved, both usually with straight awns; lower floral glume resembling the upper invol.-glume, 5-9-nerved, empty. muticous or very shortly awned, with or without a hyaline 2-nerved or more or less reduced palea; upper floral glume 2-sexual, as long as or shorter than the lower, chartaceous to corraceous, 5-7-nerved, muticous: palea of similar texture, about equal to the glume, 2-nerved. Lodicules 2, minute, cuneate. Stamens 3. Styles distinct, long; stigmas exserted at the top of the glumo. Grain oblong-ellipsoid, free within the hardened glume and palea .- DISTRIB. Species about 8, in the warmer parts of the world.

1. Oplismenus compositus, Beauv. Agrost. (1812) p. 54. A tall branching grass; stems 1-3 ft. long, slender, branched, and creeping below; branches ascending, leafy, rooting from the lower nodes. Leaves variable, 2-6 by $\frac{1}{2}$ in., ovate to ovate-lanceolate, acuminate, thin, flat, glabrous or hairy, base narrow, auricled on one side; sheaths glabrous or pubescent, with ciliate margins. Panicle 3-10 in. long: peduncle long or short; branches of panicle usually distant, 1-3 in. long; rhachis glabrous or pubescent, an; Spikelets distant, 1 in. long (excluding the awn), green; pedicels very short, often with a tuft of hairs at the base. Glumes 4; lower invol.-glume ovate-lanceolate, acuminate, 10 in. long (without the awn, which is about & in. (or more) long and truncate at the apex, glabrous, often purple), 5-nerved, membranous; upper invol.-glume in, long (including a short mucro or awn), rather broader than the lower invol.-glume, 5-7-nerved, membranous; lower floral glume, in. long, membranous, broadly ovate, subacute, the midrib prolonged behind

into a very short apiculation, 7-9-nerved with a very narrow palea; upper floral glume shorter than the lower, ovate-oblong, acute, coriaccous, smeoth, shining, with incurved margins; palea oblong, acute, with strongly involute margins. Fl. B. I. v. 7, p. 66; Trim. Fl. Ceyl. v. 5, p. 168; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1173. Oplismenus lanceolatus, Kunth, Revis. Gram. (1829) p. 45; Dalz. & Gibs. p. 292.—Flowers: Nov.—Dec.

Konkan: at the foot of the Ghats under the shade of trees, Dalzell & Gilson; Matheran, Weedrow; Thana, Lisbon, Duccan; Lanoli, Lisbon, Kanan; Kadgal (N. Kanara), Woodrow!—Distrib. Throughout India; Ceylon, most tropical regions (except Australia).

2. Oplismenus Burmanni, Beauv. Agrost. (1812) p. 54. A very slender diffusely branched leafy grass; stems 6-18 in. long; nodes glabrous or hairy. Leaves 3-2 by 1-1 in., ovate or ovate-lanceolate, acuminate, sparsely piloso with long slender white hairs; sheaths glabrous or hairy. Panicle 1-21 in. long; pedanele slender (almost filiform), usually very long; branches of panicle spike-like, few, distant, subsessile, 1-7 in. long; rhachis slender, angular, clothed with long slender white hairs nearly as long as the spikelets. Spikelets 1 in. long (excluding the awns), secund, solitary or 2-nate; pedicels short, hairy. Glumes 4; lower invol.-glumo to in, long (excluding the acute scaberulous capillary awn which reaches } in. long), ovate, obtuse, 3-5-nerved, hyaline, silky-hairy and ciliate; upper invol.-glume similar and subequal to the lower, 5-nerved, with an awn reaching \frac{1}{2} in. long; lower floral glume reaching 1, in. long (excluding an awn of about in. long), broadly ovate, subobtuse, concave, hyaline, silky-hairy, and ciliate, 7-9-nerved, empty, epaleato; upper floral glume as long as the lower, ovate, acute, membranous, with incurved margins; palea as long as the glume, membranous, ovate-oblong, acute, with strongly involute margins. Fl. B. I. v. 7, p. 68; Dalz. & Gibs. p. 291; Trim. Fl. Ceyl. v. 5, p. 169; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1173 .- Flowers: Sept.-Oct.

Found usually under the shade of trees throughout the Presidency, Daladla Giben. Konkan: Parel (Bombay), Woodrow. Dr. Can: Panelgani, Woodrow. Grankar: Domas (near Surat), Code!—Distrib. Throughout India; Ceylon, Malay Islands, China, Japan, Tropical Africa.

10. PANICUM, Linn.

Annual or perennial grasses of various habit. Leaves broad or narrow; ligules usually reduced to a ciliate rim or a fringe of hairs (rarely a distinct membrane) or 0. Inflorescence various. Spikelets small, 1-2-flowered, terete or dorsally or laterally compressed, solitary or 2-nate, often secund, evoid or oblong, articulate at the base and deciduous, rarely awned. Glumes 4; invol.-glumes empty; the lower the smallest (sometimes minute) and fewest-nerved; upper invol.-glume usually equal or almost equal to the lower floral glume, sometimes cuspidate, 5-13-nerved; lower floral glume equalling the upper or longer, more or less resembling the upper invol.-glume, usually neuter, paleate or not; upper floral glume coriaceous to crustaceous, sometimes shortly stipitate, convex, 2-sexual, paleate, the palea usually as long as and of the same texture as the glume. Lodicules 2, cuneate. Stamens 3. Styles distinct; stigmas laterally exserted near the top of the spikelet.

Grain free but tightly enclosed by the hardened glume and palea, oblong, ellipsoid or lanceolate.—DISTRIB. Species 200-250, chiefly in the warm regions of the world.

ogions of one works.	
Spikelets dorsally compressed or subterete. Inflorescence racemose, of simple (rarely branched) spikes or racemes bearing secund spikelets. Rhachis of spikes broad, flattened.	
Spikelots 2-seriate. Spikes shorter than the internedes Spikes longer than the internedes.	1. P. flavidum.
Upper floral glume granulate Upper floral glume smooth Spikelets 3-5-seriate; lower floral glume cuspidate	2. P. punctatum. 3. P. fluitans.
or award. Stems stout, reaching 5 ft. long; lower floral glume award Stems slender, decumbent, 1-2 ft. long; lower	4. P. stagninum.
Stems slender, decumbent, 1-2 ft. long; lower floral glume cuspidate, not awned Rhachis of spikes narrow and filiform, tereto or	5. P. colonum.
angular, Lower involglume minute, not ‡ as long as the upper floral glume, norveless. Loaf-base rounded; lower involglume	C. D. Carlan
triangular Leaf-base cordate-amplexicaul; lower	6. P. Isachne.
Lower involglume from \(\frac{1}{2}\) as long as the	7. P. prostratum.
upper floral glume, 3-5-nerved. Upper floral glume apiculate or awned. Upper floral glume only apiculate. Lower involglume ovate, acute, ½ as long as the upper floral glume	8. P. ramosum.
Lower involglume orbicular, about	
das long as the upper floral glume. Upper floral glume abruptly awned; lower involglume rather less than described the lower floral glume	9. P. setigerum. 10. P. javanicum.
Lower involglume very minute; spikelets	11 70 14
Lower involglumo \(\frac{1}{2} \) as long as the upper; spikelets	11, P, interruptum
globosely ovoid	12. P. myosuroides.
Panicles broad, effuse. Lower involglume as long as the lower floral glume or nearly so	13. P. turgidum.
Annuals. Leaves # in. broad; paniele 15 in. long	14. P. obscurans.
Leaves 3-1 in. broad; panicle 4-10 in. long.	15. P. trypheron.
Perennials. Lower involglumes very minute, 1 or rarely	
both often obsolete	16. P. subeglume.
Lower invol-glumes distinctly evident. Spikelets laxly clustered on the branches Spikelets solitary (rarely 2-nate).	17. P. antidotale.
Lower involglume not \{\} the length of the upper, orbicular or reniform	18. P. proliferum var. paludosum
Lower involglume \(\frac{1}{2}\) the length of the upper, ovate, subacute	19. P. montanum, 20. P. patens.

1. Panicum flavidum, Retz. Obs. fase, 4 (1786) p. 15. Stems I Aft. long, slender, a-cending from a short decumbent base; nedes glabrous. Leaves sub-bifarious, 3-5 by 1-1 in., parrowly linear, acuminate, thinly corinceous, glabrous or the margins slightly scaherulous; sheaths compressed, glabrous, the margins not ciliate; ligulo a ridge of long hairs. Spikes few or many, distant, erect, 1-1 in, long, shorter than the internodes, secund, sessile; rhachis flattened, glabrous. Spikelets fa in. long, gibbously globose, sessile or nearly so, 2-seriate, closely imbricate, glabrous. Glumes 4, pale-green or nearly white, the 3 lower with green nerves; lower invol.-glume about) as long as the spikelet, orbicular, concave, 3-nerved; upper invol.-glume broadly ovate, concave, shorter than the upper floral glume, 7-nerved; lower floral glume shorter than the upper, orbicular, 5-nerved, paleate, empty; upper floral glume broadly ovate or almost orbicular, often mucronate, very convex, striolate-punctate, white. Palea with the sides infolded nearly to the middle, striolate. Fl. B. I. v. 7, p. 28; Trim. Fl. Cevl. v. 5, p. 133; Woodr, in Journ. Bomb. Nat. v. 13 (1961) p. 433; Prain, Beng. Pl. p. 1174; Watt, Diet. Econ. Prod. v. 6, part 1, p. 8. Panicum brizales, Jacq. Eclog. Gram. (1813) p. 2; Dalz. & Gibs. p. 290.—Flowers: Oct.

KONKAN: N. & S. Konkan, Law! Directs: Khandala, W. drew. Gudart: near Surat, Dalzell & Gibon; Morvi (Kathiawar), W. drow, Porkander (Kathiawar), Woodrow,—Distrib. Plains of Indix; Ceylon, Trop. Asia and Africa.

2. Panicum punctatum, Buem, Fl. Ind. (1768) p. 26. Percunial, quite glabrous; stem prostrate at the often floating base, 2-4 ft. long, rooting at the lower stout spongy nodes. Leaves 4-8 by 1-2 in., linear, acute or acuminate, base narrow; lower sheaths inflated; lignle a ridge of hairs. Spikes many, 1-1 in, long, distant, sessile, longer than the internodes, appressed to the glabrous rhachis, very pale. 15-1 in. long, imbricate, sessile, 2-servate, ovoid-oblong on a flattened undulate rhachis which is produced beyond the spike into an acicular tip which is as long as or longer than the terminal spikelet. Glumes 4; lower invol.-glume small, about It in, long, orbicular, rounded or slightly retuse at the apex, thinly membranous; upper invol.-gluma about 1 as long as the floral glumes, membranous, 3-5 nerved, orbicular, with truncate or rounded tip; lower floral glume ovate, acute, 3-5-nerved, membranous, neuter; upper floral glume about as long as the lower, cuspidately acuminate, thinly coriaceous, granulate, white. Palea coriaceous, with inflexed membranous sides. Anthers -17 in. long. Fl. B. I. v. 7, p. 29; Trim. Fl. Ceyl. v. 5, p. 134; Woodr. in Journ. Bomb, Nat. v. 13 (1901) p. 433; Prain, Beng, Pl. p. 1174. Panicum fluitans, Retz. Obs. fasc. 3 (1783) p. 5 (not fasc. 5, p. 18); Grah. Cat. p. 237; Dalz. & Gibs. p. 290.—Flowers: Nov. Vens. Petnar.

DECAN: Poona, Weo irox, List a; Ahmednagar, Woolrow,—Distrib. Throughout India in marshes; Ceylon, Malaya, Mauritius, Trop, and N. Africa.

3. Panicum fluitans, Retz. Obs. fasc. 5 (1789) p. 18.—Perennial: stem 1-4 ft. long from a stout creeping lase, often as thick as a swan's quill, smooth, soft, striate; lower nodes 2-5 in. long, quite glabrous. Leaves 4-8 by \(\frac{1}{16}\) in., linear, finely assuminate, glabrous, the margins smooth or nearly so, often incurved, tase narrow; sheaths large, loose, glabrous, the margins not ciliate; lighted a ridge of hairs. Panielo 8-12 in. long; rhachis erect, angular, glabrous or nearly so. Suiles you, 11.

many, ½-1½ in. long, sessile, longer than the internodes, often appressed to the rhachis; rhachis of spikes flattened. Spikelets ½-½ in. long, ovoid, acute, glabrous, 2-seriate, imbricate. Glumes 4; lower involglume ½ in. long, broader than long, thinly membranous, without nerves, white; upper invol.-glume ovate, acute, concave, thinly membranous, with 5-7 green nerves, slightly shorter than the upper floral glume; lower floral glume subcoriaceous, 5-7-nerved, paleate, empty or male; upper floral glume broadly ovate, mucronate, thinly coriaceous, smooth or nearly so; palea with infloxed membranous margins. Trim. Fl. Ceyl. v. 5, p. 135; Prain, Beng. Pl. p. 1174. Panicum paspaloides (paspalodes), Pers. Syn. v. 1 (1805) p. 81; Hook, f. Fl. B. I. v. 7, p. 30; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433.

Dalzell without locality in Herb. Kew.! Sinn: Stocks!; Manchar Lake, Stocks!, Woodrow.—Distrib. More or less throughout India; Ceylon, Afghanistan, Arabia, Tropical Africa and America.

4. Panicum stagninum, Retz. Obs. fasc. 5 (1789) p. 17. Annual or perennial; root-fibres many, long, wiry, with numerous filiform rootlets; stem erect from a geniculate or prostrate base, reaching 5 ft. (or more) long, sometimes rooting from the lower nodes. Leaves 6-18 by $\frac{1}{6}-\frac{1}{5}$ in., linear, tapering to a fine point; sheaths striate, smooth. glabrous; ligule a fringe of stiff hairs. Panicle 4-8 in. long; rhachi slender, more or less flexuous, angular, grooved, scabrid on the ridges and with scattered bristles; branches few or many, distant or close, alternate, usually subcreet, 1-2 in, long, sessile or nearly so with a tuft of hairs at the base; rhachis of the branches angular, grooved, clothed sparingly with bulbous-based hairs. Spikelets crowded, ovoid-lanceolate, 1-1 in, long (excluding the awn), hairy with bulbous-based hairs, pale; pedicels very short with enlarged tips. Glumes 4; lower invol.-glume in. long (half as long as the spikelet), broadly ovate or suborbicular, cuspidate, 3-nerved, hairy and ciliate, thinly membranous; upper invol,gluine k in. long (including the mucro), broadly ovate, concave, hairy and ciliate with bulbous-based hairs, thinly membranous, 7-nerved in the upper part with green nerves, acuminate or produced into a short compressed scabrid awn; lower floral glume like the upper invol.-glume with an awn varying from 1-1 in. long, paleate, male, the palea hyaline, as long as the glume; upper floral glume & in long, ovate-lanceolate, mucronate, straw-colored, shining, faintly striolate, with involute margins, coriaceous: palea as long as the glume, elliptic-oblong, acute, striolate, with inflexed margins. Roxb. Fl. Ind. v. 1 (1832) p. 295; Grah. Cat. p. 237 (misspelt staginum); Stapf, in Dyer, Fl. Capen. v. 7 (1899) p. 394. Panicum Crus-galli var. stagninum, Trim. ex Hook. f. in Trim. Fl. Ceyl. v. 5, p. 136; Prain, Beng. Pl. p. 1174. P. Crusgalli, Woodr, in Journ, Bomb, Nat. v. 13 (1901) p. 433 (not of Linn.). Oplismenus stagninus, Kunth, Rev. Gram. v. 1 (1827) p. 44; Dalz. & Gibs. p. 292.—Flowers: Oct.

Throughout the Presidency in wet places, especially in cultivated ground and in ditches.—Distrib. More or less throughout India; Coylon, most warm countries.

I do not believe that the true P. Crus-galli of Limmus occurs anywhere in the Bombay Presidency, P. stagnium, which has been restored to specific rank by Stapf (Fl. Capen. 1. c.), having been mistaken for it. Dalzell's Oplismenus Crus-galli, which has been cited in the 'Flora of British India' (v. 7, p. 31) as a synonym for P. Crus-yalli, is undoubtedly Panicum Isachne. P. stagnium is a tall plant which

grows in water-holes and places where water has lodged; it has a conspicuous ligale of a fringe of lairs, as noticed by Dr. Stapf in his classes on p. 351 in the Flora Capensis, while P. Crus-galls has no ligale.

Van. frumentacea, Trim. Cat. Ceyl. Pl. (1885) p. 104. Tall, robust; panicle often nodding; spikes thickened, often incurved, sometimes branched and corymbosely panicled, lower floral glume cuspidate but not awned. Fl. B. I. v. 7, p. 31; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433; Prain, Beng. Pl. p. 1174. Panicum frumentaceum, Roxb. Fl. Ind. v. 1 (1832) p. 304; Grah. Cat. p. 237; Watt, Diet. Econ. Prod. v. 6, part 1, p. 9. Optimenus frumentaceus, Dalz. & Gibs. Suppl. p. 98.—Vers. Shamula.

Cultivated in and near the Ghat districts. The quickest growing of all the millets and in some localities can be harvested within six weeks after being sown (Watt).

5. Panicum colonum, Linn. Syst. ed. 10 (1759) p. 870. Annual; stem 1-2 ft. long, slender, decumbent or shortly creeping below; nodes glabrous or puberulous. Leaves 4-8 by 1-1 m., narrowly lanceolate or linear, acaminate, flat, glabrous, with scaberulous margins; sheaths up to 6 in. long; ligule 0. Spikes 8-20, suberect, usually distant, 1-1 in. long; rhachis stout, angular, scaberulous on the angles. Spikelets 12-10 in. long, globosely ovoid, acute or subcuspidate, more or less hispidly pubescent, secund, sessile, 3-5-serute. lower invol.-glume about I as long as the lower floral glume, broadly ovate or suborbicular, membranous, 3-nerved, eiholate; upper invol.glume about equal to the lower floral glume, broadly evate, cuspidate, concave, 5-7-nerved, hairy; lower floral glume similar, empty, with a byaline palea; upper floral glume coriaceous, broadly ovate, turgid, acute, finely striolate, polished, yellowish white, with a coriaceous palea. Very similar to P. frumentaceum, Roxb., but a more slender plant with smaller spikelets. Fl. B. I. v. 7, p. 32; Grah. Cat. p. 237; Trim. Fl. Ceyl. v. 5, p. 136; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 433; Prain, Beng. Pl. p. 1174; Watt, Diet. Econ. Prod. v. 6, part 1, p. 7. Oplismenus colonus, H. B. & K. Nov. Gen. & Sp. v. 1 (1815) p. 108; Dalz. & Gibs. p. 291.-Flowers: Oct. VERN. Bovur; Samu.

KONKAN: Stockst S. M. Counter: Londa, Woodrow, Greaker: Morvi (Kathiawar), Woodrow, Sind; Stocks, 650!, Woodrow, Shikarpar, Woodrow, Distain, Throughout the plains of India; Ceylon, most warm countries.

6. Panicum Isachne, Roth, Nov. Pl. Sp. (1821) p. 54. Annual; stems many, 1-2 ft. long, ascending from a decumbent or creeping and rooting base, geniculate, very slender, with villous nodes, otherwise glabrous, much branched below, simple above. Leaves 1-2 by \(\frac{1}{2}-\frac{1}{2}\) in., linear-lanceolate from a rounded base, acute, subpungent, glabrous or sparsely hairy with scaberulous margins; sheaths glabrous or hairy, ciliate on the upper part; ligule a fringe of hairs. Inflorescence 2-3 in. long, erect, consisting of 6-12 secund or subsecund racemosely arranged spikes \(\frac{1}{2}-1\) in. long, longer than the internodes, sessile or shortly pedunculate, usually appressed to the triquetrous slender hairy rhachis. Spikelets \(\frac{1}{12}-\frac{1}{1}\), in. long, secund, closely imbricate in 2 series, oblong, subacute or obtuse, softly hairy; rhachis of spikes triquetrous, hairy, about \(\frac{1}{3}\) in, in diam; pedicels very short. Glumes 4; lower invol.-glume minute, triangular, membranous, glabrous; upper invol.-

7. Panicum prostratum, Lamk Illustr. v. 1 (1791) p. 171. A slender annual grass; stem 4-15 m long, ascending from a long creeping base, often branched below; nodes pubescent; internodes 1-3 in long Leaves 1-2 by 1-5 in., ovate-lanceolite from a cordate amplexical base, acuminate, thin, that, nearly glabious or quite glabrous above, often clothed with long han's beneath, sometimes nearly glabrous, sheaths shinder, with ciliate margins; ligule a tuft of white hans or 0. Racemes 5-8, alternate, second, 1-1 in. long, sessile or shortly pedunculate, districtionally spreading; thachis of racemes slender, angular. Spikelets 1, -1 in. long, solitary or binate, secund, ellipsoid, somewhat turged, subscute, glabrous or hairy, pedicels very short, with long slender hairs at the tip below the spikelet. Glumes 4; lower invol.-glume minute, semilunate, hyaline, nerveless; upper invol-glume about equilling the lower floral glume, membranous, broudly ovate, acute, pubescent, 7-nerved; lower floral glume 5-nerved, empty, with hyaline palea; upper floral glume elliptic, dorsally rounded, thinly corraceous, finely striolite, nearly white, with subcorraceous paler. Anthers 1 in. long Fl. B. I. v. 7, p. 33; Dale & Gibs. p. 290; Tim Fl Cevl. v. 5, p. 138, Woodr. in Jouin. Bomb. Nat. v. 13 (1901) p. 433, Pram, Beng Pl. p. 1175; Watt, Dict. Econ. 8. Panicum ramosum, Linn. Mantiss. (1767) p. 29. Annual; stem 1-3 it. long, erect or ascending from a shortly creeping base, slender or rather stout, much branched from the base upwards, usually glabious, leaty; nodes pubescent. Leaves 2-5 by 1-1 m., linearlanceolate, finely acuminate, thin, flat, smooth, glibrous or pubescent beneath, with scaberulous margins, base rounded; sheaths glabrous or pubescent, chate or not towards the mouth; ligule a finge of short hairs. Panicle 2-6 in. long, subpyramidal, with a long peduncle; rhachis angular; branches of panicle 5-10, distant, 1-2 in. long, alternate or the lower opposite, elect or spreading, shorter upward rhachis of racemes'slender, angular, puberulous. Spikelets alterry 10-8 in. long, close or distant, often in pans (a sessile and a pedicina one), ovoid, acute, pubescent, tuigid, pale green or yellowish; pe by with a few long hans near the tip. Glumes 4; lower invol.-glum th, long as the lower floral glume, ovate, acute, hyalme, upper invol-flor about equalling the lower floral glume, ovate, acute, cuspidate, 5-nexch lower floral glume similar but slightly broader, with membranous par

empty; upper floral glume coriaceous, ovoid-oblong, acute, rugulose, with coriaceous palea. Fl. B. I. v. 7, p. 36; Trim. Fl. Ceyl. v. 5, p. 140; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433; Prain, Beng. Pl. p. 1175. Panicum Helopus, Watt, Dict. Econ. Prod. v. 6, part I, p. 10 (partly). P. umbrosum, Retz. Obs. fasc. 4 (1786) p. 16; Roxb. Fl. Ind. v. 1 (1832) p. 297.—Flowers: Aug.—Nov.

DECCAN: Poona, Woodrow, Lisboa. S. M. COUNTRY: Badami, Woodrow.—DISTRIB. Throughout India; Ceylon, Afghanistan.

9. Panicum setigerum, Retz. Obs. fasc. 4 (1786) p. 15. 2-3 ft. long, prostrate and widely straggling below, branched, slender, firm; nodes bearded, the lower rooting; internodes 1-2 in. long. Leaves 3-5 by $\frac{3}{8} - \frac{7}{8}$ in., ovate-lanceolate from a cordate, amplexicall, more or less ciliate base, finely acuminate, flat, thin, with slender midrib, 5-6 pairs of nerves and scabrid margins; sheaths glabrous except at the back beneath the leaf-blade, with ciliate margins; ligule a tuft of long woolly hairs. Inflorescence of 3-10 racemes 1-2 in. long, the lower very distant, alternate; rhachis of racemes angular, glabrous or pubescent, villous at the base. Spikelets $\frac{1}{10}$ in. long, loosely imbricate, 2-seriate (one often pedicellate, the other sessile), secund, ovoid, acute or acuminate, glabrous or pubescent; pedicels pubescent and with long spreading slender hairs on or below the pedicel. Glumes 4; lower invol.-glume about \(\frac{1}{3} \) as long as the upper, orbicular, thinly membranous; upper invol.-glume broadly ovate, acute or acuminate, 7-nerved, membranous; lower floral glume about equal to the upper invol.-glume, 5-nerved, paleate, neuter, the palea membranous, as long as the glume, subacute; upper floral glume elliptic, obtuse, shortly apiculate, coriaceous, granulate, with narrowly incurved margins, the palea coriaceous, elliptic-oblong, obtuse. Fl. B. I. v. 7, p. 36; Trim. Fl. Ceyl. v. 5, p. 141; Woodr. in Journ. Bomb. Nat. v. 13 (1901) v. 433: Prain. Beng. Pl. n. 1175.—Flowers: Sent.—Dec.

VAR. tomentosa, Hook. f. Fl. B. I. v. 7 (1896) p. 37. Margins of leaves and sheaths with long white hairs; spikelets larger, $\frac{1}{6}$ in. long, tomentose; awn longer.

GUJARAT: Rajkot (Kathiawar), Woodrow, 45!

10. Panicum javanicum, Poir. Encyl. Suppl. v. 4 (1816) p. 274. Annual; stem 1-2 ft. long, decumbent and rooting below, geniculately ascending, branching upwards; nodes pubescent. Leaves 1-5 by 1-1 in., ovate-lanceolate, from a rounded, cordate, or amplexical base, acuminate, softly hairy on both sides, with scaberulous margins; sheaths loose, softly hairy, the mouth villous; ligule a beard. Panicle erect; branches 6-12, rather distant; rhachis of racemes compressed, Spikelets $\frac{1}{8} - \frac{1}{6}$ in. long, secund, 2-seriate, glabrous or pubescent. 2-loosely imbricate, subsessile or very shortly pedicellate, ovoid, arraute, pubescent, tomentose, or villous; pedicels pubescent and shorth a few long hairs near the tip. Glumes 4; lower invol.-glume rhackte, acute or obtuse, not 1 as long as the upper invol.-glume, 3-nerved oblonderveless; upper invol.-glume as long as and similar to the lower hairy at glume, ovate, acute, 7-nerved; lower floral glume similar, 5-nerved, involuty or male, with membranous palea; upper floral glume crustaceous, broadly ovate-oblong, rugulose, the tip rounded, abruptly cuspidate with a long mucro, concealed by the lower glumes, and with a crustaceous palea. Fl. B. I. v. 7, p. 35; Trim. Fl. Ceyl. v. 5, p. 142; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433; Prain, Beng. Pl. p. 1175. Panicum Helopus, Watt, Dict. Econ. Prod. v. 6, part 1, p. 10 (partly). Country: Badami, Woodrow. Gujarat: Baroda, Cooke!—Distrib. Plains of India; Ceylon, Tropics generally. A good fodder grass for horses and cattle.

11. Panicum interruptum, Willd. Sp. Pl. v. 1 (1797) p. 341. A large peronnial grass, quite glabrous; stem reaching 5-6 ft. long, ascending from a stout creeping and rooting or floating rootstock; lower nodes emitting fascicles of long stout roots clothed with root-hairs; upper internodes very long, slender. Leaves 6-12 by \(\frac{1}{4}-\frac{1}{2}\) in, linear, finely acuminate, soft, flat, glabrous, with smooth or scaberulous margins, base rounded or subcordate; sheaths 2-4 in. long, with smooth margins; ligule short, broad, membranous. Inflorescence a spike-like panicle 6-12 by $\frac{1}{4}-\frac{1}{3}$ in., cylindric, interrupted below; rhachis stout, strict, channelled. Spikelets $\frac{1}{6}-\frac{1}{5}$ in. long, densely crowded in small fascicles, subsessile or shortly pedicellate, spreading, ovoid-lanceolate, acute, green. Glumes 4; lower invol.-glume scarcely 1_6 in. long, broadly ovate, obtuse, hyaline, 3-5-nerved; upper invol.-glume ovate, acute, herbaceous, membranous, prominently 9-nerved; lower floral glume about equalling the upper invol.-glume, ovate, acute, 7-nerved, paleate, male or barren, the palea hyaline; upper floral glume shorter than the lower, ovateoblong, subacute, thinly coriaceous, white, polished, dorsally convex, the palea thinly coriaceous, as large as the glume. Anthers purple, much exserted. Grain obovoid, apiculate. Fl. B. I. v. 7, p. 40; Dalz. & Gibs. p. 316; Trim. Fl. Ceyl. v. 5, p. 147; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433; Prain, Beng. Pl. p. 1175.—Flowers: Oct.-Feb.

Korkan: Stocks!, Law!; Panvel, Woodrow; Vingorla, Woodrow; margins of tanks throughout the Konkan, Dalzell & Gibson. S. M. Countan: Londa, Woodrow! Sind: Woodrow.—Distrib. Throughout India in swamps; Ceylon, Malaya, Trop. and S. Africa.

12. Panicum myosuroides, R. Br. Prodr. (1810) p. 189. Stem 2-3 ft. long, erect, or shortly creeping below, rather stout, leafy; internodes 3-5 in. long. Leaves 6-8 by $\frac{1}{10}$ in., narrowly linear, finely acuminate, margins smooth, base narrow; sheaths 2-4 in. long, with naked margins; ligule 0. Inflorescence a spike-like panicle $\frac{1}{2}$ -8 by $\frac{1}{6}$ in., cylindric, erect or curved; rhachis grooved, glabrous. Spike-lets innumerable, $\frac{1}{12}$ in. long or less, densely crowded in small fascicles, very shortly pedicellate, globosely ovoid, obtuse, glabrous or pubescent, green or purplish. Glumes 4; lower invol.-glume about $\frac{1}{2}$ as long as the upper, ovate, subacute, 3-nerved; upper invol.-glume ovate, obtuse, conspicuously 5-9-nerved, glabrous or pubescent; lower floral glume about equalling the upper invol.-glume, but broader, ovate, obtuse, very concave, 5-9-nerved, glabrous or pubescent, paleate, empty; upper floral

glume much smaller than the lower, ovate-oblong, acute, quite smooth, white, dorsally convex with involute margins, thinly coriaceous; palea as long as the glume. Fl. B. I. v. 7, p. 42; Trim. Fl. Ceyl. v. 5, p. 148; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1175.

Konkan: Sávantvádi, Woodrow; Alibag, Lisboa.—Distrib. Throughout the hotter parts of India; Ceylon, Malay Peninsula, China, Australia, Trop. Africa.

13. Panicum turgidum, Forsk. Fl. Ægypt.-Arab. (1775) p. 18. Perennial, glabrous, glaucous; rootstock sometimes as thick as the little finger; root-fibres thick, velvety; stem hard (bamboo-like), solid, smooth and polished, $\frac{1}{10-8}$ in. in diam. about the middle, emitting from the nodes fascicles of branches in tufts from a swollen base. Leaves few, those at the base of the stem and branches 1-3 in. long, flat, coriaceous, linear-lanceolate, acuminate, smooth, those of the upper nodes often reduced to open chartaceous sheaths with a setiform blade. Panicle terminal, subpyramidal, 12-4 in. long; branches at first erect, then more or less spreading, ½-1½ in. long; rhachis angular, grooved, glabrous. Spikelets 1-1 in. long, solitary, or rarely 2-nate, subsecund, ovoid, turgid, glabrous, white; pedicels short or long, with a cupular tip, scaberulous. Glumes 4, subcoriaceous; lower invol.-glume scarcely shorter than the upper, and about equalling the lower floral glume, broadly ovate, acute, concave, 5-7-nerved; upper invol.-glume broadly ovate, acute, 7-nerved; lower floral glume ovate, acuminate, 9-nerved, paleate, male; upper floral glume much smaller than the lower, ovate-oblong, acute, smooth, polished. Anthers purple. Styles short; stigmas short, pale purple. Fl. B. I. v. 7, p. 44; Delile, Fl. d'Egypte, p. 19, t. 9, fig. 2; Duthie, Fodd. Grass. N. Ind. p. 13; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434.—Flowers: Nov. The plant grows on arid or desert plains.

Gujarat: Rajkot (Kathiawar), Woodrow. Sind: Duthic.—Distrib. Beluchistan, Egypt, Arabia, Trop. Africa.

14. Panicum obscurans, Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434. Annual; stems tufted, erect or ascending, 1-2 ft. (or more) high (in specimens raised from seed by Woodrow at Poona, in the College of Science Botanical Garden, the stem is simple and about 3 ft. high); nodes glabrous. Leaves $3\frac{1}{2}-5$ by $\frac{3}{8}$ in. at the widest part, lanceolate, acute, with a few scattered hairs above, hispid with bulbous-. based hairs below; sheaths closely striate, hispid with short bulbousbased hairs, the margins naked; ligule a tuft of hairs. Panicle large, 15 by 12 in., pyramidal, lax; branches of the panicle widely spreading, laxly racemosely or subpaniculately branched, each branchlet 1-3-flowered at the apex, naked below; rhachis angular, grooved, scaberulous on the Spikelets distant, solitary, $\frac{1}{6}$ in. long, pedicellate, narrowly uninate. Glumes 4, the 3 lower strongly nerved with green ovoid, acuminate. nerves; lower invol.-glume 1/8 in. long, ovate, acuminate, shorter than the upper, membranous, 5-nerved, the nerves scaberulous; upper invol.glume 1 in. long, ovate, acuminate, 7-nerved; lower floral glume rather less than \(\frac{1}{6} \) in. long, ovate, acuminate, empty, paleate, the palea \(\frac{1}{2} \) as long as the glume, elliptic-oblong, hyaline, shortly 2-dentate; upper floral glume 1 in. long, crustaceous, hard, smooth, concave, elliptic,

obtuse, with incurved margins, yellowish-white, very faintly 5-7-nerved; the palea crustaceous, elliptic, obtuse, with incurved margins, as long as the glume. *Isachne obscurans*, Woodr. in Gard. Chron. v. 23, ser. 3 (1898) p. 161.—Flowers: Nov.—Dec. Vern. *Tán-sawa*. The whole inflorescence breaks off and is driven about by the wind (*Woodrow*).

Dr.ccan: Jeur near Sholapur. Woodrow! Specimens in Herb. Kew. also grown from seed in the Botanic Garden of the College of Science at Poona.

The grain is used as a fast-day food and cooked like rice (Woodrow).

15. Panicum trypheron, Schult. Mantiss. v. 2 (1824) p. 244. Annual; stems 1-3 ft. high, tufted, erect, or geniculate below, stout or slender, leafy at the base; nodes glabrous; internodes 2-5 in. long. Leaves 3-10 by 1-1 in., usually flat, thin, linear, acuminate, more or less hairy on both surfaces, margins often ciliate, base narrow; sheaths long, glabrous or hairy, the margins often ciliate towards the top; ligule short, fimbriate. Panicle 4-10 in. long, often as broad as long, effuse; rhachis filiform, slightly scaberulous; branches up to 4 in. long, Spikelets 10 18 in. long, very distant, ovoid, acuminate, sometimes with a purple tinge, glabrous; pedicels long or short, filiform. Glumes 4: lower invol.-glume about 3 as long as the lower floral glume, broadly ovate, acuminate, membranous, 5-nerved; upper invol.-glume slightly longer than the lower floral glume, ovate, acuminate, 7-9-nerved; lower floral glume similar but shorter, 7-nerved, empty, paleate, the palea oblong, obtuse, 2-toothed at the apex, smaller than the glume, hyalme; upper floral glume elliptic, obtuse, dorsally convex, smooth, shining, yellowish-white, coriaceous, faintly 5-nerved, the margin very slightly incurved, the palea elliptic, as long as the glume, coriaceous. F. B. I. v. 7, p. 47; Trim. Fl. Ceyl. v. 5, p. 152; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1176.—Flowers: Vern. Bhatur. Sept.

Panicum maximum, Jacq. Icon. Pl. Rar. v. 1 (1781) p. 2, t. 13. A tall perennial reaching 8-10 ft. high the first year, but after being cut two or three times it does not grow so high but grows thicker. The Guinca Grass, a native of Africa, cultivated as a fodder crop chiefly in Gujarat and Sind. Fl. B. I. v. 7, p. 49; Trim. Fl. Ceyl. v. 5, p. 153; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1176. Panicum altissimum, Brouss. Elench. Hort. Monsp. (1805) p. 42; Dalz. & Gibs. Suppl. p. 98. P. jumentorum, Pers. Syn. v. 1 (1805) p. 83; Duthie, Fodd. Grass. N. Ind. (1888) p. 9; Watt, Dict. Econ. Prod. v. 6, part 1, p. 10.

Panicum miliaceum, Linn. Sp. Pl. (1753) p. 58. An annual hairy grass 2-4 ft. high with leafy erect stem and a much-branched panicle, a native of Egypt and Arabia, is cultivated in many places in Gujarat and on the Ghâts for its grain which is eaten and a preparation of which constitutes a favorite food at marriage ceremonies. Fl. B. I. v. 7, p. 45; Grah. Cat. p. 237; Dalz. & Gibs. Suppl. p. 98; Duthie, Fodd. Grass. N. Ind. (1888) p. 9; Trim. Fl. Ceyl. v. 5, p. 150; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1176; Watt, Dict. Econ. Prod. v. 6, part 1, p. 12.—Vern. Varai; Ghoti-sáva.

Panicum miliare, Lamk. Illust. v. 1 (1791) p. 173. Annual; stems many, 1-3 ft. high, erect, leafy; leaves smooth, linear, finely acuminate, glabrous or nearly so. Cultivated occasionally but not largely, in Gujarat and other parts of the Bombay Presidency. The grain, which becomes dark brown when ripe, is eaten by the poorer classes. Fl. B. I. v. 7, p. 46; Grah. Cat. p. 237; Duthie, Fodd. Grass. N. Ind. (1888) p. 10; Trim. Fl. Ceyl. v. 5, p. 150; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1176; Watt, Dict. Econ. Prod. v. 6, part 1, p. 13. Panicum psilopodium, Trin. Gram. Pan. Diss. 2 (1826) p. 217; Hook. f. Fl. B. I. v. 7, p. 46; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434.—Vern. Sáva.

Panicum muticum, Forsk. Fl. Ægypt.-Arab. (1775) p. 20. A tall grass; stem 6-8 ft. high with bearded nodes; leaves 6-10 by $\frac{1}{2}$ - $\frac{2}{3}$ in. with subcordate base; panicle 3-8 in. long. The Water-Grass and Mauritius Grass of Ceylon, a native of S. America, has been occasionally cultivated according to Woodrow at Kirkee and Surat. It is a valuable fodder grass and has been largely grown in Ceylon. Fl. B. I. v. 7, p. 34; Trim. Fl. Ceyl. v. 5, p. 140; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433; Prain, Beng. Pl. p. 1175.

EXCLUDED SPECIES.

PANICUM AURITUM, P. INDICUM, P. NODOSUM, and P. TRIGONUM are given in Woodrow's list (Journ. Bomb. Nat. v. 13) as occurring in the Bombay Presidency, but no localities have been assigned as their habitat. There are no specimens of these from the Bombay Presidency in Herb. Kew. and there is not at present any evidence to show that they exist in that Presidency.

II. DICLLARIA, Rich.

arctic regions. World; I species widely spread as a weed all over the globe except the the palea. Distrats, Species about 50, mostly in warm parts of the Old compressed, free, but tightly enclosed between the hardened glume and exserted near the apex of the floret. Grain oblong, slightly dorally Stamens 3. Styles distinct; stigmas plumose, laterally the glume, and of same texture, 2-nerved. Lodicules 2, minute, broadly or subchartaceous, usually 3-nerved. Palea of upper floret subequal to nerves close, parallel, straight, prominent; upper floral glume chartaceous equal, the lower like the upper invol-glume, nsually 7-9-nerved, the glume membranous, 1-5-nerved or nerveless; floral glumes equal or subsometimes absent or present in the same species; the upper invol.very dissimilar, normally 4; the lower invol-glume usually hyaline, glume and a very minute palea; upper floret hermaphrodite. Glumes but not thickened at the base; lower floret barren, reduced to the floral usually 2-3-nate, in digitate or racemose spikes, jointed on the pedicel Annual or perennial grasses. Leaves linear or lanceolate.

6. D. Royleana.	Spikelets with clavellate hairs
5. D. longillora.	Spikelets subsliky with slender (not clarellate) bairs
	Rhachis narrowly winged.
4. D. pedicellaris.	evonogirt, Traffiges eidsedA
	Spikelets less than 15 in, long.
3. D. pennula.	Spikolets aubsilky; apikes many
rar, elliaris,	
2. D. sanguinalis	Spikelets bearded; spikes few
	Hairs on the spikelets not clarate.
1. D. lernala.	Spikelets with charace hairs
•	Spikelets 1, in, long or longer,

I. Digitaria ternata, Supj, in Dyer, Fl. Capen. v. 7 (1898) p. 376. Annual; stems tuited, erect from a geniculate base, slender, 6–18 in. long, glabrous or nearly so. Leaves 2–6 by 4 in., linear-lanceolate, acute, glabrous; sheaths glabrous, striate, the mouth ciliate; ligules short, truncate, membranous. Spikes 2–3 (or more), subdigitate, erect or spreading, silvery-white; rhachis marrowly winged. Spikelets 2–3-nate, 4 in. long, elliptic, subacute, closely appressed to the rhachis, pale; pedicels unequal, up to 1/4 in. long, shortly hairy towards the tips. Lower invol.-glume usually obsolete; upper invol.-glume tender, 3-lower invol.-glume usually obsolete; upper invol.-glume tender, 3-lower prominently 5-nerved, densely and appressedly silky-villous with clavate hairs, the upper chartaceous, ovate-oblong, subacute, dark brown (nearly black). Paspulum ternatum, Hook, f. Fl. B. I. v. 7 (1896) p. 17; (nearly black). Paspulum ternatum, Hook, f. Fl. B. I. v. 7 (1896) p. 17; (nearly black). Inspulum ternatum, Hook, f. Fl. B. I. v. 7 (1896) p. 17; (nearly black).

S. M. Coustry. Belgana, Ruche! - Distain, India (Khasia Hills); Abyssinia.

2. Digitaria sanguinalia, Scop. Pl. Cara. ed. 2, v. I (1772) p. 52. Var. ciliaria, Prain, Beng. Pl. p. 1181. Annual; stems tall, reaching 3 ft. long or more, slender, ascending from a geniculate or prostrate branched base, glabrous. Leaves 2-6 by 4-4 in., linear or linear-branched base, glabrous. Leaves 2-6 by 4-5 in., linear or linear-branched base, glabrous, and scabrous anargins, glabrous or more or less sparsely harry; sheaths long, loose, glabrous, or rarely hairy except sparsely harry; sheaths long, loose, glabrous, or rarely hairy except mear the mouth. Spikes fow (3-8), 3-6 in. long; thatchis slender,

triquetrous, narrowly winged. Spikelets oblong, acute, $\frac{1}{10} - \frac{1}{10}$ in. long, bearded; pedicels twin, one short, the other much longer, triquetrous with scabrid margins. Glumes 4; the lower invol.-glume a minute scale; the upper invol.-glume about $\frac{1}{2}$ as long as the lower floral glume, membranous; the lower floral glume ovate-oblong, acute, membranous, 3-5-nerved; the upper floral glume as long, subchartaceous. Paspalum sanguinale var. ciliaris, Hook. f. Fl. B. I. v. 7, p. 15. Paspalum ciliare, DC. Fl. Fr. ed. 3, v. 6 (1815) p. 250. Panicum ciliare, Retz. Obs. fasc. 4 (1786) p. 16; Grab. Cat. p. 237. Panicum sanguinale var. ciliaris, Watt, Dict. Econ. Prod. v. 6, part 1, p. 15.—Flowers: Oct. Vern. Roega; Dinohi.

Throughout the Presidency, common.—DISTRIB. Most warm countries.

3. Digitaria pennata, Hook. f. Fl. B. I. v. 7 (1896) p. 16 (Paspalum). Stems 2 ft. long, tufted, leafy. Leaves 1-6 by \(\frac{1}{8} - \frac{1}{4} \) in., linear or linear-lanceolate, finely acuminate, glabrous or sparsely hairy, distantly ciliate with long, fine, bulbous-based hairs; sheaths long, striate, glabrous or with a few scattered hairs; ligule long, oblong, membranous. Spikes several, radiating, 3-6 in. long; rhachis very slender, trigonous, with numerous long cilia. Spikelets erect, solitary or 2-nate, \(\frac{1}{8} \) in. long, narrowly lanceolate, acute, subsilky. Glumes normally 4; lower invol.-glume minute, ovate, acute (rarely absent); upper invol.-glume lanceolate, acute, membranous; lower floral glume similar to the upper invol.-glume, 3-5-nerved; upper floral glume chartaceous, lanceolate, acuminate, nearly equal to the lower. Paspalum pennatum, Hook. f. l. c.; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433.—Flowers: Oct.

Gujarat: Morvi (Kathiawar), Beck ex Woodrow. Sind: Jemadar ka Landa near Karachi, Stocks, 1183!—Distrib. Beluchistan, Abyssinia.

4. Digitaria pedicellaris, Prain, Beng. Pl. (1903) p. 1181. Stems tufted, 6-18 in. long, leafy. Leaves 2-6 by $\frac{1}{10}$ - $\frac{1}{6}$ in., linear-lanceolate, finely acuminate. Spikes 3-10, alternate, racemosely arranged on a very slender peduncle, suberect or spreading, 1-4 in. long; rhachis capillary, trigonous; pedicels $\frac{1}{24}$ - $\frac{1}{8}$ in. long, those of the upper spikelet longer than the spikelet. Spikelets 2-5-nate, $\frac{1}{20}$ - $\frac{1}{16}$ in. long, elliptic, acute. Lower invol.-glume obsolete; upper invol.-glume elliptic, acute, very slightly hairy, 5-nerved, thinly membranous (almost hyaline); lower floral glume similar; upper floral glume elliptic, acuminate, thickly membranous, pale. Paspalum pedicellare, Trin. ex Steud. Nom. ed. 2 (1841) p. 272; Hook. f. Fl. B. I. v. 7 (1896) p. 19; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433.

Konkan: Stocks!-Distrib. Throughout India.

5. Digitaria longiflora, Pers. Syn. v. 1 (1805) p. 85 (not of Trin.). Annual or perennial; stems many, tufted, slender, creeping and rooting, or ascending or suberect, 6-18 in. long, glabrous, with many nodes, often branched, leafy. Leaves ½-4 in. long, linear-lanceolate, acute, spreading, flat, or, in short-leaved states, stiff and pungent, glabrous (rarely hairy); sheaths smooth or hairy; ligule very short, membranous. Spikes 2-5, terminal, very slender, 1-4 in. long, erect or spreading; rhachis narrowly winged, glabrous; pedicels 2 (rarely 3)-nate, unequal,

short. Spikelets $\frac{1}{26-16}$ in. long, appressed to the rhachis, elliptic, obtuse, acute or subacute, pale or purplish, glabrous, or subsilky with wrinkled hairs. Lower invol.-glume 0 or rudimentary; upper invol.-glume 3-7-nerved; lower floral glume similar and subequal to the upper invol.-glume, 3-5-nerved; upper floral glume subchartaceous, ovate-oblong, slightly shorter than the lower, pale brown, smooth; palea with inflexed (not auricled) flaps. Prain, Beng. Pl. p. 1181. Digitaria tenuiflora, Benuv. Agrost. (1812) p. 51. Paspalum longiflorum, Retz. Obs. fasc. 4 (1786) p. 15; Hook. f. Fl. B. I. v. 7, p. 17; Trim. Fl. Ceyl. v. 5, p. 124; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433.

Throughout the Presidency, but not common.—Distrib. Throughout India; Coylon, tropical and subtropical regions of the Old World.

6. Digitaria Royleana, Prain, Beng. Pl. (1903) p. 1181. nial; stems 1-2 ft. long, tufted, slender, erect, lenfy. Leaves 4-9 by 1-1 in., erect, linear, acuminate, flat, glabrous or sparsely ciliate towards the base; sheaths glabrous or with a few scattered hairs; ligule short, rounded, membranous. Spikes 3-15, erect, subdigitate or alternate, 3-6 in. long, on the top of a slender peduncle, very slender; rhachis filiform, very narrowly winged, glabrous; pedicels often much longer than the spikelets, usually setulose with long hairs. Spikelets secund, in. long, broadly elliptic, tomentose with minute clavellate hairs. Lower invol.-glume 0 or reduced to a tuft of hairs; upper invol.-glume usually much smaller than the floral glumes or reduced to hairs; lower floral glume thinly membranous, broadly elliptic, strongly 5-nerved, as long as and broader than the upper floral glume; upper floral glume thinly coriaceous, ovate, acute, striolate, polished and shining, dark brown or nearly black; palea with inflexed flaps. Paspalum Royleanum, Nees, ex Thw. Enum. (1864) p. 358; Hook. f. Fl. B. I. v. 7, p. 18; Trim. Fl. Cevl. v. 5, p. 125; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 433.—Flowers: Dec.

Western Ghats (Suvneni Ghat), Weodrow!—Distrib. Hilly districts throughout Indin; Ceylon, Trop. Africa.

12. PASPALUM, Linn.

Annual or perennial grasses. Leaves lauceolate or ovate-lauceolate. Spikelets orbicular to oblong, obtuse, 1-flowered, awiless, falling off entire from the very short or obscure pedicels, secund and generally 2-ranked on the flattened or triquetrous rhachis of spikes, plano-couvex; lower floret barren, reduced to the floral glume; upper floret hermaphrodite. Glumes 3; lower invol.-glume 0; upper invol.-glume membranous, as long as the floral glume (rarely shorter or obsolete). Floral glumes equal or subequal; the lower resembling the upper invol.-glume; the upper chartaceous to subcoriaceous. Palea subequal to and of the same texture as the upper floral glume. Lodicules 2, connate. Stamens 3. Styles distinct, slender; stigmas plumose, exserted from near the top of the spikelet. Grain tightly enclosed in the hardened floral glume and palea, dorsally subcompressed.—Distrib. Species about 150, chiefly natives of the New World.

Annual.

1. Paspalum scrobiculatum, Linn. Manties. (1767) p. 29. Annual; stems 2-3 ft. long, tusted on a very short rhizome, erect (rarely ascending), leafy from the base upwards, glabrous. Leaves bifarious, erect or subcrect, 6-18 by $\frac{1}{12-8}$ in., finely acuminate, glabrous or sometimes softly hairy; sheaths 4-8 in. long, compressed, loose, the mouth hairy, with very short membranous ligules. Spikes 2-6, sessile, usually distant and spreading, 1-6 in. long; rhachis herbaceous, 1-1 in, broad with ciliate margins. Spikelets usually 2-ranked, $\frac{1}{12}$ in, in diam., sessile or shortly pedicellate, broadly elliptic or suborbicular. imbricate. Glumes 3; lower invol.-glume 0; the upper convex, 3-7nerved, membranous; lower floral glume flat, membranous, like the upper invol.-glume; upper floral glume thickly coriaceous, brownish, shining, striolate; palea orbicular, tumid, thickly coriaceous like the upper floral glume, dorsally convex, ventrally strongly inflexed below the middle and forming 2 broad membranous auricles that embrace the grain. Fl. B. I. v. 7, p. 10; Grah. Cat. p. 234; Dalz. & Gibs. Suppl. p. 97; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433; Prain, Beng. Pl. p. 1182; Watt, Diet. Econ. Prod. v. 6, part 1, p. 111. Paspalum Kora, Willd. Sp. Pl. v. 1 (1797) p. 332; Grah. Cat. p. 234.—Flowers: VERN. Harik.

Throughout the Presidency, cultivated.—Distrib. Tropics of the Old World.

The grain is eaten by the poorer natives, but its use requires care and considerable preparation, as in some cases the grain is poisonous and produces unconsciousness or delirium with violent tremors of the voluntary muscles. See Watt, Dict. Econ. Prod. 1. c.

2. Paspalum compactum, Roth, Nov. Pl. Sp. (1821) p. 36. Plant 6-12 in. high; roots stiff, wiry; stems terete, decumbent and branched below, leafy, hairy. Leaves 1-3 by \frac{1}{3}-\frac{1}{2} in., elliptic-lanceolate, acute, sparsely hairy on both sides, eiliate; sheaths densely hairy with fine bulbous-based hairs; ligule very short. Spikes numerous, shorter upwards, spreading (often nearly horizontally), glabrous or nearly so, forming a pyramidal raceme 2-4 in. long; rhachis slender, triquetrous. Spikelets \frac{1}{20-170} in. in diam., hemispheric, rather turgid, close-set but not imbricate, pendulous by short filiform pedicels. Lower invol.-glume 0; upper invol.-glume broadly elliptic or suborbicular; lower floral glume narrower; upper floral glume subcoriaceous, concave, orbicular, rounded at the tip, white; palea not or obscurely auricled. Fl. B. I. v. 7, p. 12; Steud. Syn. Gram. (1855) p. 31; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433.—Flowers: Sept. Vern. Kuri.

Konkan: Stocks! Decean: Lanoli, Lisboa, Woodrow; Mahableshwar, Cooke!, Woodrow. Kanara: Woodrow.—Distrib. India (W. Peninsula).

3. Paspalum distichum, Linn. Amæn. Acad. v. 5 (1760) p. 391. Perennial; stem many-noded, sheathed throughout, ascending from a creeping, rooting, often very long and branched base. Leaves numerous, distichous, 2-4 by $\frac{1}{20}$ - $\frac{1}{6}$ in., linear-lanceolate, acuminate, involute or flat, spreading, membranous, or, in short-leaved states, stiff and pungent, glabrous or nearly so; sheaths thin, glabrous except the usually bearded mouth; ligules very short, truncate. Spikes 2-nate, shortly pedunculate and articulate on the top of the stem; rhachis herbaceous, $\frac{1}{20}$ in. broad. Spikelets sub-essile, solitary or 2-nate, elliptic-oblong, $\frac{1}{12}$ in. long, acute, dorsally flattened, imbricate and appressed to the rhachis,

glabrous, pale. Lower invol.-glume 0; upper invol.-glume membranous, with a scarcely evident midnerve; lower floral glume like the upper invol.-glume with a distinct midnerve; upper floral glume shorter, elliptic, concave, acuminate, subcoriaceous, smooth, nearly white; palea not or obscurely auricled. Anthers $\frac{1}{20}$ $\frac{1}{16}$ in. long. Fl. B. I. v. 7, p. 12; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 433; Prain, Beng. Pl. p. 1182. Paspalum longiflorum, Beauv. Fl. d'Owar. v. 2 (1809) p. 46, t. 85 (not of Retz.); Grah. Cat. p. 234.—Flowers: Oct.

Konkan: Sea-shore, Bombay, Woodrow; Malwan, Woodrow.—Distrib. India (Sundribans, W. Peninsula, Andamans); Malacca.

13. **ERIOCHLOA,** H. B. & K.

Annual or perennial grasses. Leaves flat, lanceolate or ovate-lanceolate. Spikelets 1-flowered, aristulate, secund on the spiciform branches of a raceme or panicle, the base thickened and articulate on the thickened apex of the short pedicel. Glumes 3; lower invol.-glume (of Panicum &c.) absent; upper invol.-glume subequal to the lower floral glume; upper floral glume paleate, rather shorter than the lower, apiculate, hardening in fruit. Lodicules truncate. Stamens 3; anthers linear. Styles 2, free; stigmas plumose, subapically exserted. Grain oblong, free between the hardened glume and the palea.—Distrib. Species few, tropical.

1. Eriochloa polystachya, H. B. & K. Nov. Gen. & Sp. v. 1 (1815) p. 95, f. 31. Perennial, densely tufted, 2-5 ft. high; rootstock short, creeping; stems leafy, ascending from a creeping base, stout or slender, simple or branched, glabrous except the nodes. Leaves 3-8 by $\frac{1}{6}$ in., ·linear or linear-lanceclate, acuminate, glabrous; sheaths glabrous, ligule a villous ridge. Panicles 2-5 in. long; peduncles long or short; rhachis slender, angular, smooth; branches of panicle (spikes) alternate, 1-2 in. long, subcreet, angular. Spikelets silvery, $\frac{1}{8} - \frac{1}{6}$ in. long, loosely imbricate, shortly pedicellate, distichous, solitary or 2-nate, ellipticlanceslate, acuminate. Lower invol.-glume 0; upper invol.-glume oblong-landcolate, acuminate, obscurely 3-nerved, silky-hairy, membranous; lower florar glume similar to the upper invol.-glume; upper floral glume much shorter than the lower, elliptic-oblong, obtuse. apiculate, thinly coriaceous, pale, shiring; palea oblong with incurved margins. Anthers linear. Grain oblong, free within the hardened glume and palea. Fl. B. I. v. 7, p. 20; Trim. Fl. Ceyl. v. 5, p. 126; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 433; Prain, Beng. Pl. p. 1183. Eriochloa annulata, Kunth, Revis. Gram. v. 1 (1829) p. 30; Watt, Diet. Econ. Prod. v. 3, p. 257.—Flowers: Oct.

Konkan: Bombay near Mahim, Woodrow, Li. boa. Kanara, Lishoa.— Distrib. Throughout India; Ceylon, most hot countries.

14. DIMERIA, R. Br.

Erect slender, annual or perennial grasses. Leaves narrow. Inflorescence of solitary or 2-nate or digitate slender racemes bearing many spikelets; rhachis of racemes inarticulate, terete, angular or flattened. Spikelets 1-flowered, articulate, subsessile or on very short pedicels, laterally much compressed, solitary, secund, bifarious, 2-sexual.

Glumes 4; invol.-glumes usually divaricate in flower, empty; lower invol.-glume coriaceous, linear, with complicate sides, dorsally rounded; upper invol.-glume as long as or longer than the lower one, chartaceous, oblong, with hyaline margins and complicate sides, dorsally keeled, the keel sometimes winged; lower floral glume shorter than the upper invol.-glume, linear or oblanceolate, empty, epaleate; upper floral glume hyaline, complicate, oblong, 2-fid, awned in the sinus, the awn capillary with a short column; palea minute or 0. Lodicules 0 or very minute. Stamens 2; anthers long or short. Styles short; stigmas short, laterally exserted. Grain linear, compressed.—Distrib. Tropical Asia and Australia; species 18.

1. Dimeria ornithopoda, Tria. Fund. Agrost. (1820) p. 167, t. 14. A slender annual tufted leafy grass 6-20 in, high. Leaves 1-3 by $\frac{1}{10}$ - $\frac{1}{8}$ in., erect, linear, finely acuminate; sheaths usually glabrous. Racemes 2 (rarely 3), very slender, 1-2 in, long; rhachis flexuous, stout, angular. Spikelets about $\frac{1}{10}$ in, long, sessile or subsessile, linear, acuminate; callus villous with short white hairs. Glumes 4; lower invol.-glume slender, linear, acute, $\frac{1}{10}$ in, long, slightly pubescent or nearly glabrous; upper invol.-glume slightly longer than the lower one, linear, acuminate, with hyaline margins, pubescent on the back; lower floral glume $\frac{1}{10}$ in, long, linear, acute; upper floral glume $\frac{1}{10}$ in, long, hyaline; awn nearly $\frac{1}{10}$ in, long, the column $\frac{1}{10}$ in, long, brown, the upper part white, capillary. Fl. B. I. v. 7, p. 104; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 436; Prain, Beng. Pl. p. 1187. Psilostachys filiformis, Dalz, in Dalz, & Gibs. Bo. Fl. (1861) p. 305.—Flowers: Oct. Vern. Khalp-kurdi.

Konkur: Mahableshwar, Palzell & Gibson, Liebea; Panchgani, Woodrow; Khandala, Westrew; Lanoli, Liebea, Kanua; Jagabet (N. Kanara), Talbet, 1565!
—Distrum, Throughout India; Malay Islands, Japan, Tropical Australia.

2. Dimeria Woodrowii, Stapf, in Hook. Icon. Pl. v. 24 (1895) 1. 2312. Annual, 3-6 in. high; stem slender, leafy, more or less branched; nodes pubescent; upper internode (or peduncle) with its leaf abruptly deflexed after flowering. Leaves 12-3 by 15, 16 in., linear, finely acuminate, 3-nerved, with a strong midnerve, glabrous or nearly so; sheaths glabrous; ligule very short, hyaline. Racemes 3-1 in. long, geminate, at first erect, then circinately incurved, glabrous; rhachis trigonous, subundulate; internodes shorter than the spikelets; pedicels distinct, about 10 in. long. Spikelets 1 in. long, sublinear, few, rather distant, subcreet, diverging as the rhachis incurves; callus bearded. Glumes 4; lower invol.-glume rather more than 1 in. long, linear, acute, folded, 1-nerved, glabrous or sparsely hairy; upper invol.-glume slightly longer than the lower one, broader, neute, marrowly keeled and thickened at the back, the margins hyaline; lower floral glume narrowly linear, hyaline, sometimes mucronulate; upper floral glume rather more than 10 in. long, 2-lid, awned at the sinus, hyaline, the awn about & in. long. Grain linear-lanceolate, compressed.

Fl. B. I. v. 7, p. 104; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436.—Flowers: Oct.

Konkan: Ratnagiri, Woodrow!; Marmagão, Talbot, 2557!—Distrib. India (W. Peninsula).

3. Dimeria gracilis, Nees, ex Steud. Syn. Gram. (1855) p. 413. Perennial; stems densely tufted, 1-3 ft. high, leafy, stout or slender, rarely branched. Leaves 6-10 by $\frac{1}{8} - \frac{1}{6}$ in., erect, rigid, narrowly linear, finely acuminate, glabrous or pilose, base narrowed into the sheath; sheaths terete, not auricled at the mouth; ligule short, broad, membranous, ciliolate. Racemes 3-10, very slender, 3-5 in. long, pale brown, lax-flowered, flexuous; rhachis filiform, obtusely trigonous or subterete, glabrous. Spikelets 1-1/4 in. long; pedicels long or short; callus very short; densely bearded. Glumes 4; lower invol.-glume in. long, linear, acute, plicate, more or less scaberulous; upper invol.glume 1 in. long, linear, acute, aristate, with hyaline ciliolate margins; lower floral glume obovate-oblong, ciliolate above the middle; upper floral glume $\frac{1}{10}$ in. long, linear-oblong, acutely 2-fid; awn $\frac{3}{8}$ in. long (or more), the lower third brown, the upper two-thirds white; palea minute, narrow, ciliate. Lodicules large, broadly cuneate. Fl. B. I. v. 7, p. 105; Trim. Fl. Ceyl. v. 5, p. 199; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436.—Flowers: Dec.

Konkan: Law!, Stocks! Duccan: Woodrow, 172!; Lanoli, Woodrow.—Distrib. India (W. Peninsula); Ceylon.

15. IMPERATA, Cyrill.

Erect perennial grasses; stem leafy; internoles solid. Leaves narrow. Spikelets 1-flowered, in spike-like subcylindric silvery-silky panicles, with very short filiform inarticulate branches and rhachises, all alike and 2-sexual, narrow, terete, hidden among very long hairs arising from a small callus and from outer glumes, 2-nate, a sessile and a pedicellate one, articulate at the base, fugacious. Glumes 4; involute, as subequal, membranous, dorsally rounded or the upper obscurely glumes energy at the base; lower involuglume ovate-lanceolate keeled. 3-5-nerven the base; lower involuglume accuminate; floral with a byaline obtuse tip; differ involuglume accuminate; floral glumes short, often erose; palea minute, hyaline. Lodicules 6. Stamens 1 or 2. Styles connate below; stigmas very long, narrow, exserted at the top of the spikelets. Grain small, oblong.—Distrib. Species 5, tropical, chiefly American; 2 Asiatic, one also European.

1. Imperata arundinacea, Cyrill, Pl. Rar. Neap. fasc. 2 (1792) p. 26, t. 11. Rootstock stoloniferous, often creeping; stem 1-3 ft. high, stout or slender; nodes naked or bearded. Leaves 6-18 by 16-15 in., linear, flat, tapering from the middle to a finely acuminate point, smooth above, scaberulous beneath and on the margins; sheaths loose, glabrous; ligule of long soft hairs. Paniele 3-8 in. long, narrow, spikelike, subcylindric, silvery-white; branches short, crowded, appressed. Spikelets \(\frac{1}{5}\) in. long, lanceolate: pedicels \(\frac{1}{25}\)-\(\frac{1}{5}\) in. long; hairs of callus twice as long as the spikelet. Glumes 4: invol.-glumes ovate-lanceolate, subcqual in length, obtuse or subobtuse, with ciliate tips, 3-7-nerved; lower floral glume less than \(\frac{1}{2}\) as long as the invol.-glumes, oblong, obtuse, denticulate, ciliate, nerveless; upper floral glume ovate, glabrous, nerveless or with 1 faint nerve. Anthers \(\frac{1}{10}\) in. long, orange. Stigmas

1-1 in. long, purple. Fl. B. I. v. 7, p. 106: Trim. Fl. Ceyl. v. 5, p. 200; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436; Prain, Beng. Pl. p. 1188: Watt, Dict. Econ. Prod. v. 4, p. 336. Saccharum cylindricum, Lam. Encyc. Méthod. v. 1 (1783) p. 594; Grah. Cat. p. 239.

KANARA: Law! GUJARAT: Law ex Graham. SIND: Stocks!—DISTRIB. Throughout the hotter parts of India; Ceylon, most warm countries.

16. SPODIOPOGON, Trin.

Tall grasses. Leaves often with long petioles. Spikelets 1-2-flowered, paniculate, laterally compressed or subterete, 2-3-nate; lower sessile, male; upper 2-sexual; rhachis jointed. Glumes 4; invol.-glumes subequal; lower invol.-glume lanceolate, 5-9-nerved, with an acuminate or toothed tip; upper invol.-glume membranous, lanceolate, 3-7-nerved; lower floral glume hyaline, paleate or not, triandrous or empty; upper floral glume 2-fid or 2-partite, with a very slender exserted awn in the sinus; palea shorter than the glume. Lodicules cuneate. Anthers linear. Stigmas linear. Grain free, narrowly fusiform.—Distrib. Species about 5, Asiatic.

1. Spodiopogon albidus, Benth. in Journ. Linn. Soc. v. 19 (1881) p. 66. A weak straggling tufted annual grass 2-4 ft. high; stem slender, much-branched, leafy. Leaves 6-10 by \(\frac{1}{4}-\frac{3}{4}\) in., oblong-lanceolate, acuminate, 1-nerved, usually suddenly narrowed into a slender petiole 1-3 in. long; sheaths \(\frac{5}{6}\) in. long; ligule oblong, glabrous. Panicle at first enclosed in a long narrow spathaceous leaf-sheath; rhachis compressed, ciliate. Spikelets reaching \(\frac{1}{4}\) in. long, lanceolate, silky-villous, one pedicellate, the other sessile; pedicels \(\frac{1}{10}\) in. long, spathulate, flattened, ciliate. Glumes 4; invol.-glumes equal, ovate-lanceolate, finely mucronate, silky-hairy, 7-nerved; lower floral glume truncate, with erose tip, hyaline; upper floral glume \(\frac{1}{6}\) in. long, deeply divided at the apex into 2 very acute lobes; awn reaching \(\frac{1}{2}\) in. long, slender. Fl. B. I. v. 7, p. 108; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436. Andropogon petiolatus, Dalz. Bo. Fl. (1861) p. 303.— Flowers: Oct.

Dalzell without locality in Herb. Kew.! Korkin: W. Gháts, Woodrow, 157!; Matheran, Cooke!; Salsette, Jacquemont, 708! Decean: Lanoli, Woodrow; Mahableshwar, Cooke! Kanara: N. Kanara, Talbot, 279!—Distrib. India (Central Provinces, Rajputana, W. Peninsula).

17. SACCHARUM, Linn.

Perennial often very tall grasses. Leaves narrow, flat. Spikelets minute, awnless, 1-flowered, all similar, usually 2-nate (1 sessile, the other pedicellate), 2-sexual, articulate at the base, disposed in large silky much and densely branched panicles with spreading, at length erect, articulate capillary, usually fragile branches; sessile spikelets deciduous with the contiguous joint of the rhachis and pedicel; callus bearded with very long hairs. Glumes 4; lower invol.-glume about equal to the upper, oblong or lanceolate, dorsally flat or convex, with incurved or inflexed margins, 1-2-nerved at each flexure, keels not winged nor scaberulous; upper invol.-glume concave, dorsally rounded or obscurely keeled, 1-5-nerved; lower floral glumes hyaline, oblong; upper floral

glume smaller or 0, awnless; palea small, hyaline, nerveless or 0, Lodicules 2, cuneate or irregular. Stamens 3. Stigmas laterally exserted. Grain oblong or subglobose.—Distrib. Species about 12, tropical, chiefly Asiatic.

1. Saccharum spontaneum, Linn. Mant. (1771) p. 183. erect grass reaching sometimes 20 ft. high; stem erect from a stout rootstock, solid, smooth, polished, silky beneath the panicle. 1-21 ft. by 1-1 in., narrowly linear, finely acuminate, rigid, coriaceous, usually glabrous, often with convolute margins; sheaths smooth, with fimbriate mouth; ligule ovate, membranous. Panicle 8-24 in. long, lanceolate, silky-hairy; rhachis slender; branches 3-5-nate, 2-4 in. long; rhachis of racemes almost capillary, fragile. Spikelets ! in. long, lanceolate; callus minute, bearded with spreading silky hairs & in. long. Glumes 4; lower invol.-glume lanceolate-subulate, acuminate: upper invol.-glume equal to the lower, lanceolate, obscurely keeled, 1-nerved; lower floral glume ovate-lanceolate, subacute, ciliate, hyaline, nerveless; upper floral glume very slender, ciliate; palea minute, ciliate. Fl. B. I. v. 7, p. 118; Dalz. & Gibs. p. 304; Trim. Fl. Ceyl. v. 5, p. 201; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 436; Prain, Beng. Pl. p. 1188; Watt, Diet. Econ. Prod. v. 6, part 2, p. 11.—Flowers: Nov. ${
m V_{DRN}},\; {\it Bagberi}\,;\; {\it Kamis}\,;\; {\it Khair}.$

KONKAN: Stocks!; Karjat, Woodrow. Deccan: Poona (river-bank), Woodrow! S. M. Country: Belgaum, Ritchie. Gujarat: Baroda, Cooke!; Domas (near Surat), Dalzell & Gibson. Sind: Stocks, 545!; Shikarpur, Woodrom.—Distrib. Throughout India; Ceylon, S. Europe and warm regions of the Old World, East Australia.

ndi ngari demandipak ari ya kiri den Angah Yumbur ya 20 sacrat mbi ili samuniphih yandi distri Pengasiri kadiniya kiriba
Saccharum arundinacum, Retz. Obs. fasc. 4 (1786) p. 14. A tall strikingly handsome grass reaching, under favorable conditions, nearly 20 ft. high, with leaves 3-5 ft. by 1-3 in. with a conspicuous midrib. Fanicle T=2 ft. long, cream-colored, brown or purplish. Spikelets about long, clothed with soft creamy or purplish woolly hairs. Fl. B. I. v. 7, p. 119; Trim. Fl. Ceyl. v. 5, p. 202; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436; Prain, Beng. Pl. p. 1188; Watt, Dict. Econ. Prod. v. 6, part 2, p. 1. Saccharum exaltatum, Roxb. Fl. Ind. v. 1 (1832) p. 245; Grah. Cat. p. 239.

I cannot find any evidence that this plant is indigenous in the Bombay Presidency. The only specimens from Bombay in Herb. Kew, were collected by Woodrow from a Bombay garden, and Lisboa (Journ. Bomb. Nat. v. 6 (1891) p. 190) remarks that it has been seen only in cultivation in Bombay gardens, while Woodrow (l.c.) gives no habitat, merely noting it as "planted."

Saccharum officinarum, Linn. Sp. Pl. (1753) p. 54. The Sugar Cane, extensively cultivated in the Bombay Presidency and throughout the hotter parts of India. For a full account of the cultivation of the plant and the mode of extraction and refining of its sugar, see Watt, Dict. Econ. Prod. v. 6, part 2, pp. 3-380.—Venn. Us.

18. ERIANTHUS, Michx.

Tall perennial grasses. Leaves flat, narrow. Spikelets all similar, 2-nate (one sessile, the other pedicellate, very rarely both unequally pedicellate), 1-flowered, 2-sexual, on the articulate and usually fragile

rhachis of paniculate racemes (the sessile spikelets deciduous with the internode and pedicel); callus bearded with long hairs. Glumes 4; invol.-glumes subequal; lower invol.-glume oblong-lanceolate, dorsally flattened, more or less distinctly 2-keeled; upper invol.-glume 1-3-nerved, keeled; lower floral glume hyaline, oblong, muticous or mucronate; upper floral glume shortest, generally awned; palea small, hyaline, nerveless. Lodicules 2, cuneate. Stamens 2-3. Stigmas usually laterally exserted. Grain oblong or subglobose.—Distrib. Species about 20, mainly tropical.

Racemes panicled; leaves 2-3 ft. by 1-1½ in., scaberulous; sheaths hairy; callus with long silky hairs.

Racemes subdigitate; leaves 1-2 ft. by ½-¼ in., smooth; sheaths glabrous; hairs of callus short

1. E. Ravennæ.

2. E. fastigiatus.

1. Erianthus Ravennæ, Beauv. Agrost. (1812) p. 14. Stem 6-10 ft. high; nodes glabrous. Leaves 2-3 ft. by $1-1\frac{1}{2}$ in., linear, scaberulous on both surfaces, flat, margins scabrid, midrib broad; sheaths hairy; ligule a narrow silky-hairy band. Panicles oblong, 1-3 ft. long, erect or inclined, clothed with silky hairs; branches many from the rhachis. Spikelets pale, in. long (excluding awn), linear-lanceolate; pedicels with 2 opposite rows of very long silky hairs; callus short, with long silky hairs which are as long as or longer than the spikelet. Glumes 4; lower invol.-glume 1 in. long, membranous, lanceolate, aristately acuminate, with slightly scaberulous margins; upper invol.-glume slightly longer than the lower, lanceolate, aristately acuminate, obscurely 3-nerved; lower floral glume rather more than $\frac{1}{5}$ in. long, narrowly lanceolate, very acute, with incurved margins, hyaline; upper floral glume $\frac{1}{10}$ in. long, ovate-lanceolate, tapering into a whitish awn of Fl. B. I. v. 7, p. 121; Woodr. in Journ. Bomb. variable length. Nat. v. 13 (1901) p. 436.—Flowers: Dec.

Sind: Larkhana, Cooke!; Karachi, Cooke!, Woodrow.—Distrib. India (W. Himalaya, Panjab, Upper Gangelic plain, W. Peninsula); westward to the Mediterraneau.

2. Erianthus fastigiatus, Nees, ex Steud. Syn. Gram. (1855) p. 409. Stem 2-8 ft. high, stout or slender, silky-hairy below the panicle. Leaves 1-2 by 1-1 in., linear from a narrow base, rigid, flat, smooth, with scabrid margins; sheaths glabrous, with fimbriate mouth; ligule a narrow membrane. Panicle oblong or fan-shaped; racemes crowded, subdigitately fascicled; rhachis angular, silky-hairy. Spikelets in. long, lanceolate, dark brown below, paler above; callus with white hairs which are much shorter than the spikelet; pedicels as long as the spikelets, with 2 opposite rows of silky hairs. Glumes 4; lower invol.-glume 1 in. long, chartaceous, brown, shining, ovate-lanceolate, acute, the margins near the base clothed with long silky hairs; upper invol.-glume chartaceous, lanceolate, acuminate, brown below, paler above, equalling the lower invol.-glume; lower floral glume $\frac{1}{6}$ in. long, narrowly lanceolate, acute, base membranous, colored, the upper part hyaline; upper floral glume 10 in. long, lanceolate, 2-toothed, hyaline, with a slender awn 4 in. long or longer. Fl. B. I. v. 7, p. 125; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436; Prain, Beng. Pl. p. 1189.

S. M. Country: Belgaum, Ritchie, 792!—Distrib. India (Sikkim, Khasia, Assam, Bengal, W. Peninsula).

19. POLLINIA, Trin.

Annual or perennial grasses of various habit. Leaves usually narrow. Spikelets all alike or nearly so, 3-nate (one sessile, the other pedicellate, rarely both pedicellate) on the articulate and usually fragile rhachis of 2-nate, digitate or fascicled spike-like racemes; callus short, bearded. Glumes 4; lower invol.-glume membranous, dorsally flattened or concave, more or less 2-keeled, with inflexed margins; upper invol.-glume membranous, keeled, 1-3-nerved, with inflexed margins; lower floral glume hyaline, paleate or not, sometimes suppressed; upper floral glume short, hyaline, 2-lobed or entire, generally awned; palea small or 0. Lodicules 2, small, cuneate. Stamens 3 (rarely 2). Styles short; stigmas linear, laterally exserted. Grain oblong.—Distrib. Species about 32, in tropical and subtropical regions of the Old World.

Racemes many, 6-12; perennial 1. P. argentea.
Racemes few, 2-4; annual 2. P. fimbriata.

1. Pollinia argentea, Trin. in Bull. Sc. Acad. Pétersb. v. 1 (1836) p. 71. Perennial; stems tufted, 13-4 ft. high, stout or slender, erect, simple or branched, smooth, shining, leafy at the base and upwards; nodes glabrous. Leaves 6-18 by $\frac{1}{20}$ - $\frac{1}{3}$ in., erect, narrowly linear, rigid, often filiform, glabrous, striate, tips capillary; sheaths long, slender, coriaceous, not anricled at the mouth, the sides bearded with long hairs; ligule a short membrane fringed with long hairs. Racemes 6-12, narrow, 1-6 in. long, lax-flowered; rhachis firm, flexuous, compressed; pedicels of spikelets flattened, slightly dilated at the apex, densely silkyvillous on the edges. Spikelets 1 in long (excluding the long awn). Glumes 4; lower invol.-glume linear-oblong, crustaceous below, membranous above with a hyaline tip, silky villous on the back, the margins narrowly incurved, villous with long silky hairs; upper invol.glume oblong, 1-nerved, tip erose, margins incurved, ciliate; lower floral glume in in. long, narrowly oblong, hyaline, flat, nerveless; upper floral glume shorter than the upper invol.-glume, linear-oblong, cleft into 2 subulate lobes; palea 0; awn reaching 3 in. long, not or scarcely ciliate, the lower half brown, twisted, the upper half white, straight. Fl. B. 1. v. 7, p. 111; Trim. Fl. Cevl. v. 5, p. 204; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436; Prain, Beng. Pl. p. 1190,—Flowers: Oct.-Dec.

Konran Ratusgiri, Wowdrow. Drucan: Mawal, Woodrow, 1:; Lanoli, Woodrow, Lishoa.—Distrib. Throughout India: Ceylon, Malaya, Australia.

2. Pollinia fimbriata, Huck. Monogr. Androp. in DC. Monog. Phan. v. 6 (1889) p. 164. Annual; stem 1-2 ft. long; internodes much longer than the sheaths; nodes glabrous. Leaves 6-10 by & in., flaccid, sparsely hairy above; sheaths glabrous; ligule a ciliolate ridge. Racemes 2-4, villous with white hairs, 1-3 in. long, flexuous, pale, with long peduncles; rhachis slender, silky-hairy; pedicels of spikelets with 2 opposite rows of dense silky hairs. Spikelets & in. long; callus very short, silky-villous with long white hairs. Glumes 4; lower involglume elliptic-lanceolate, with villous keels above, 2-toothed; upper invol.-glume as long as the lower, elliptic, obtuse, with incurved ciliate margins; lower floral glume & in. long, narrowly oblong, obtuse, hyaline, ciliolate; upper floral glume & in. long, hyaline, deeply 2-fid into 2

acute lobes; awn $\frac{1}{2}$ - $\frac{3}{1}$ in. long, ciliate, the lower half brown, twisted, the upper half white; palea minute or 0. .Fl. B. 1. v. 7, p. 112; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436.—Flowers: Oct.

Konkan: Law!, Stocks! Decean: Lanoli, Woodrow, 173!—Distrib. India (W. Himalaya, W. Peninsula, Pegu).

20. OPHIURUS, Gærtn.

Annual or perennial tall grasses; stems solid, branching upwards, leafy. Leaves linear-lanceolate. Spikes solitary or fasciculate, terete, fragile; joints excavate, with concave tops. Spikelets 2-flowered, solitary and sessile in the joints, with no trace of an upper spikelet and no awn. Glumes 4; lower invol.-glume thickly coriaceous, convex, obtuse; upper invol.-glume membranous, concave, keeled; lower floral glume elliptic, obtuse, hyaline, faintly 2-nerved, the margins infolded, paleate, male; upper floral glume as long as the lower, oblong, obtuse, 2-sexual; palea narrow. Lodicules 2, cuneate. Stamens 3; anthers linear. Styles and stigmas small, not exserted. Grain oblong, free.—Distrib. Tropical Asia and Africa; species 1 or 2.

1. Ophiurus corymbosus, Gartn. f. Fruct. v. 3 (1805) p. 4, t. 181, fig. 3 a (Ophiuros). Perennial; stems erect from a tuberous base, 3-6 ft. high, reed-like, as thick as a goose-quill below, solid, branching upwards, leafy throughout; nodes glabrous. Leaves 6-24 by 3-1 in., flat (convolute in vernation), linear-lanceolate from a rounded base, finely acuminate, hairy above with bulbous-based hairs, glabrous beneath, the margins spinulose; sheaths short, terete, the upper leafless; ligule Spikes 2-5 by \sqrt{z} in., corymbosely fasciculate, erect, often very short. in very dense fascicles, frequently tinged with purple; peduncles short; joints as long and as broad as the spikelets, the tip obliquely truncate. Spikelets 1 in. long. Glumes 4; lower invol.-glume thickly coriaceous or cartilaginous, oblong, obtuse, convex, more or less seriately foveolate on the back, glabrous, at length recurved; upper invol.-glume membranous, as long as the lower, faintly 3-nerved; lower floral glume. equalling the lower invol.-glume, elliptic, obtuse, hyaline, paleate, male; upper floral glume as long as the lower, elliptic-oblong, obtuse. Anthers 15 in. long. Fl. B. I. v. 7, p. 160; Dalz. & Gibs. p. 300; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 437; Prain, Beng. Pl. p. 1191. Rottboellia corymbosa, Linn. f. Suppl. (1781) p. 114; Grah. Cat. p. 233.— Flowers: Dec. Vern. Hutia.

DECCAN: pastures, Dalzell & Gibson; Poona, Cooke!, Woodrow; Jeur (Ahmednagar districts), Woodrow. S. M. Country: Bulgaum, Ritchie, 807! Gujarat: Dalzell & Gibson, Woodrow.—Distrib. India (Himalaya and Khasia Hills, N. Bengal, W. Peninsula); Tonkin, Australia.

21. ROTTBOELLIA, Linn. f.

Annual or perennial grasses of various habit; stems leafy. Leaves narrow, flat. Racemes solitary or subpaniculate; rhachis articulate; internodes terete or compressed, each bearing a pair of usually dissimilar awnless spikelets, the lower 1-2-flowered, usually 2-sexual, the upper pedicellate, male or neuter, sometimes rudimentary, the pedicel free or adnate to the side of the internode. Glumes 4; lower invol.-glume

coriaceous, dorsally flattened or subconvex, ovate or oblong, usually obtuse; upper invol.-glume chartaceous to membranous, muticous; lower floral glume hyaline, paleate or not; upper floral glume paleate, 2-sexual. Lodicules 2, quadrate or cuneate. Stamens 3. Stigmas generally laterally exserted. Grain broadly oblong.—Distrib. Species about 30, temperate and tropical.

Rhachis of raceme not fragile; lower invol.-glume not winged; a perennial grass Rhachis of raceme fragile; lower invol.-glume winged (scarcely winged in R. exaltata). Annual; stems less than 30 in. long; lower invol.-glume broadly winged. Lower invol.-glume 2-aristate Lower invol.-glume with a simple awn or acuminate. Pedicel of upper spikelet adnate to the joint of the rhachis. Lower invol.-glume broadly ovate, acuminate (not awned)..... Lower invol.-glume lanceolate with a slender scabrid awn Pedicel of upper spikelet wholly free from the of the rhachis; lower invol. glume Perennial; stems 6-10 ft. long; lower invol-glume scarcely winged

1. R. compressa.

2. R. divergens.

3. R. acuminata.

4. R. Talbeti.

5. R. Clarkei,

6. R. exaltata.

1. Rottboellia compressa, Linn. f. Suppl. (1781) p. 114. Perennial: stems erect from a decumbent rooting base, 2-5 ft. long (according to Roxburgh scandent and reaching 20 ft. long), branched, compressed, glabrous, striate, leafy. Leaves 1-5 by 1-3 in., linear, acuminate, flat, glabrous, base rounded, margins scabrid; sheaths shorter than the internodes, compressed, loose, glabrous; ligule short, membranous, ciliate. Racemes few or many, often fascicled, 2-5 in. long. erect, straight or curved, herbaceous, dark green; rhachis almost inarticulate; internodes broad, striate, glabrous, nearly as long as the glabrous spikelets. Sessile spikelets 1-1 in. long; callus small, naked. Glumes 4; lower invol.-glume coriaceous, bluntly acuminate, the tip often shortly membranous, 7-9-nerved; upper invol.-glume as long as the lower, linear-oblong, acutely acuminate, membranous, 3-nerved, adhering to the cavity of the internode; floral glumes subequal, & in. long, lauceolate, acute, nerveless, hyaline; palea linear, 1 in. long. Pedicellate spikelets rather longer and narrower than the sessile; lower invol.-glume acutely acuminate; upper invol.-glume chartaceous, 5-7nerved; floral glumes as in the sessile spikelets. Fl. B. I. v. 7, p. 153; Grah. Cat. p. 233; Roxb. Fl. Ind. v. 1, p. 354; Trim. Fl. Ceyl. v. 5, p. 206: Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 437; Prain, Beng. Pl. p. 1192.—Flowers: Nov. VERN. Baika.

GUARAT: Godra, Cooke! Sind: Woo Irow; Shikarpur, Woodrow.—Distrib. Throughout the hotter parts of India, generally in wet places; Ceylou, most warm climates.

2. Rottboellia divergens, Hack. Monog. Andropog. in DC. Monog. Phan. v. 6 (1889) p. 292. Annual; stems 4-9 in. high, erect or ascending, slender; nodes 2-3, all with usually 2-nate flowering branches. Leaves 2-4 by 10^{-1} in., linear, acuminate, complicate, rising

without constriction from the sheath, hairy; sheaths 1-1½ in. long. shorter than the internodes, loose, hairy; ligule $\frac{1}{12}$ in. long, membranous, rounded. Raceme 1-12 in. long, pale yellow, simple, solitary; peduncle filiform, sheathed; joints of the rhachis shorter than the spikelets, subclavate, excised. Sessile spikelets \(\frac{1}{4} \) in. long (excluding the awns), nearly 1 in. long when the awns are included, 2-aristate; callus short. Glumes 4; lower invol.-glume coriaceous, with 5-7 transverse echinulate ridges below the middle, the tips of the echinæ curved upwards, the central portion of the glume above the echinate base ovate-lanceolate, acute, cleft at the apex, with 2 nearly semicircular equal membranous wings with thickened flattened green margins on the inner edge, which margins are prolonged into slender slightly divergent awas; upper invol.-glume much shorter, about 1 in. long, thinly membranous, oblong, acute, 1-nerved; lower floral glume about $\frac{1}{10}$ in. long, broadly ovate, nerveless, empty; upper floral glume slightly shorter than the lower. *Pedicellate spikelets* as long as the sessile; pedicels about $\frac{1}{10}$ in. long; lower invol.-glume chartaceous without a muricate base, winged on one side only and with 1 awn from the thickened margin of the wing, about 7-nerved; upper invol.-glume with a large membranous wing on the back at the apex and an awn about 1 in. long. Fl. B. I. v. 7, p. 155: Lisbon, in Journ. Bomb. Nat. v. 6 (1891) p. 195; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 437.—Flowers: Sept. Vern. Marcl.

DECAN: Khandala, Woodrow; Sattara, Lisboa!; Mahableshwar, Lisboa! S. M. COUNTRY: Belgaum, Ritchie, SOS! and S27!—DISTRIB. India (W. Peninsula).

The specimens from the Bombay Presidency in Herb. Kew, are much larger in all their parts than the specimens collected by Huegel from which Hackel described the

species originally, and to which no precise locality has been assigned.

3. Rottboellia acuminata, Hack. Monoy. Andropog. in DC. Monog. Phan. v. 6 (1889) p. 201. Annual, quite glabrous except the sheaths; stems 3-12 in. high, erect or ascending, compressed, densely leafy. Leaves flaccid, the lower 2-3 by $\frac{1}{16}$ - $\frac{1}{6}$ in., linear-lanceolate, acuminate from a narrow base, the upper shorter, spreading and recurved; sheaths turgid, compressed, keeled, the mouth hairy; ligule short, truncate, membranous, glabrous. Racemes 1-2 in. long, sheathed at the base, straight or slightly curved, usually pale brown; joints subclavate, much shorter than the sessile spikelets, the base not excised. Sessile spikelets up to \(\frac{1}{3}\) in. long; callus scarcely distinct. Glumes 4; lower invol. glume \(\frac{1}{3}\) in. long, ovate, coriaceous, winged above the middle, with 3-6 dorsal transverse echinulate or warted ridges below the wings, longitudinally striate between the ridges, 5-nerved in the narrow coriaceous part between the wings, with a long ciliate acumen, the cilia pointing upwards; upper invol.-glume 1 in. long (equalling lower minus the acumen), elliptic-lanceolate, membranous, subacute, scarcely keeled, 3-nerved; lower floral glume equalling the upper invol.-glume, elliptic, paleate, male; upper floral glume in. long, oblong, obtuse, nerveless; palea small, Pedicellate spikelets 1 in. long, oblong; lower 2-lobed, nerveless. invol.-glume lanceolate, 5-nerved, with a membranous ciliolate wing on one side; upper invol.-glume shortly winged on the back below the apex, elliptic, concave, 3-nerved; lower floral glume empty; upper floral glume male; pedicel 10 in. long, dumbell-shaped, flattened.

Fl. B. I. v. 7, p. 155; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 437.—Flowers: Oct.

Konran: Stocks!; Malwan, Woodrow; Marmagão, Talbot, 1291! Kanara: Karwar, Lisboa!, Talbot, 2539!—Distrib. India (W. Peninsula).

4. Rottboellia Talboti, Hook, f. Fl. B. I. v. 7 (1896) p. 155. Annual; stems 6-8 in. high. slender, erect, or geniculate at the base. Leaves 2-3 by $\frac{1}{10}$ $\frac{1}{8}$ in., linear, smooth; sheaths glabrous; ligule short, membranous. Raceme 3-11 by 1 in., solitary, green; joints very short, tumid, excavate opposite the spikelet, the top broad, with a very large cavity and thick hispidulous margins. Sessile spikelets & in. long (or more) including the awn, closely imbricating; callus annular, ciliolate Glumes 4; lower invol.-glume ; in. long (not including the awn), coriaceous, lanceolate, narrowed into a slender scabrid awn, with 2-3 transverse ridges at the base, the uppermost ridge extending right across the glume, the others only in its centre, broadly winged at each side above the base; upper invol.-glume 1 in. long, thinly membranous, ovate-oblong acute, 1-nerved; lower floral glume broadly oblong, faintly 3-nerved, male; upper floral glume small, oblong, obtuse, nerveless; palea as long, nerveless. Pedicellate spikelets as long as the sessile; lower invol.-glume very irregularly winged, dorsally smooth, awnless, as in the sessile; pedicel wholly adnate to the joint of the rhachis. Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 437.—Flowers: Oct.

Goa, Talbet, 2572!

There is but one sheet in Herb. Kew., the specimens on which were collected at Goa by Mr Talbot.

The species is allied to R. divergens, from which it differs in the lower involgiume of the sessile spikelets, which in that species is 2- in this 1-awned, and in the tunid joints of the rhachis.

5. Rottboellia Clarkei, Hack, in Estr. Bot. Zeitschr. v. 41 (1891) p. 8. Annual: stem 8-24 in. high, erect, striate, compressed; nodes with a small ring of hairs. Leaves 4-6 by 1-1 in., linear-lanceolate, acuminate, narrowed to the subcordate base, scabrous and more or less hairs, the hairs with minutely tubercular bases; midrib prominent; sheaths compressed, ciliate; ligule a hairy membrane. Raceme solitary, 2-1 in. long. pale yellow, supported by a spathe; rhachis very fragile; joints pyriform, shorter than the spikelets, ciliolate and with a broad cavity at the tip, the sides not hollowed. Sessile spikelets 10-1 in. long, obtuse, closely imbricating; callus short and broad, cylindric. Glumes 4: lower invol. glume with an ovate coriaceous 3-5-nerved disk and hyaline wings which are ciliate at the tip, dorsally gibbous, scabrid and hairy below the middle; upper invol.-glume To in, long, ovate-oblong, subacute, membranous, 1-nerved, glabrous; lower floral glume shorter than the upper invol.-glume, ovate-oblong, subobtuse, hyalme, nerveless; upper floral glume rather smaller than the lower, oblong, obtuse, hyaline, nerveless, the margins incurved; palea like the glume, nerveless. Pedicellate spikelets imperfect, consisting usually of a solitary empty glume about $\frac{1}{20}$ in, long; pedicel quite free from the rhaches, pythorm, flattened, about 18 in. long. Fl. B. I. v. 7, p. 156; Woodr, in Journ, Bomb, Nat. v. 13 (1901) p. 437; Prain,

membranous, densely ciliate. Racemes $\frac{1}{d}-1$ in. long, resembling a string of minute beads, solitary or seemingly fascicled in the axils of the leaves, but individually from shortened axillary branches. Sessile spikelets 1 16 12 in. long, subglobose; callus tumid, glabrous. Glumes 4; lower invol.-glume irregularly foveolate on the back; upper invol.-glume closing the cavity of the lower floral glume, elliptic-oblong, obtuse, 1-nerved; lower floral glume hyaline, shorter than the upper invol.glume; upper floral glume about equalling the lower, broadly ovate, obtuse; palea similar but a little shorter. Pedicellate spikelets equal in length to the sessile or longer, of 2 equal green glumes about 10 in. long; lower invol.-glume broadly ovate or suborbicular, obtuse or subacute, 5-7-nerved, one margin narrowly folded, the other with a hyaline wing; upper invol.-glume boat-shaped, laterally compressed, the keel with a dorsal hyaline ciliolate wing. Fl. B. I. v. 7, p. 159; Grah. Cat. p. 234; Dalz. & Gibs. p. 300; Trim. Fl. Ceyl. v. 5, p. 209; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 437; Prain, Beng. Pl. p. 1191; Watt, Dict. Econ. Prod. v. 5, p. 164.—Flowers: Oct.

Common throughout the Presidency on barren land. Deccan: Paona, Cooke!; Khandala, Woodrow. S. M. Country: Dharwar, Woodrow.—Distrib. Throughout the hotter parts of India; Ceylon, most tropical countries.

23. APLUDA, Linn.

A tall slender perennial leafy grass; stems erect or subscandent, branching. Leaves narrow, flat, more or less petiolate. Inflorescence paniculate, leafy, of small spikes each in a spathiform bract. Spikes deformed, base rounded, often utricular, bearing in front a sessile 2-sexual spikelet, prolonged above the base into 2 flat linear truncate parallel arms, one terminated by a solitary minute glume, the other by the upper spikelet. Glumes of both spikelets 4, the invol.-glumes empty, the floral glumes delicately membranous. Lower spikelets: lower invol.-glume longest, anticous, linear-oblong, coriaceous, rigid; upper invol.-glume thinner, tumid, beaked, dorsally gibbous, 7-nerved; lower floral glume oblong, acute, 3-nerved, triandrous or neuter, with a linear 2-nerved palea; upper floral glume short, quadrate, deeply 2-fid, awned in the sinus, female or 2-sexual, with a minute ovate palea. Styles short, free: stigmas short, penicillate. Upper spikelets dorsally compressed; lower invol.-glume oblong, acute, many-nerved, herbaceous, the margins narrowly incurved; upper invol.-glume chartaceous, ovatelanceolate, acuminate, 3-nerved; lower floral glume oblong, 1-nerved, triandrous; upper floral glume oblong, 1-nerved, female or imperfectly 2-sexual; paleas of both floral glumes as in the lower spikelets. Lodicules of all flowers 2, cuneate. Authors linear. Grain oblong, subcompressed.—Distruin. India, China, Pacific Islands; species 1.

1. Apluda varia, Hack. Monog. Andropog. in DC. Monog. Phan. v. 6 (1889) p. 196. Stems densely tufted, geniculately ascending, 1-6 ft. high, erect or the branches rambling among bushes, stout or slender, sometimes as thick as a goose-quill below, smooth and polished; internodes very long, solid. Leaves 4-18 by $\sqrt{3}$ in., narrowed from the middle to a filiform tip and usually below it into a long or short

slender petiole, flat, scaberulous on both surfaces with scabrid margins; sheaths long, smooth, the mouth not auricled; ligule chartaceous, oblong, lacerate. Inflorescence very variable, of spikelets clustered on short peduncles, the clusters solitary or few or very numerous and arranged in clongate bracteate very contracted interrupted leafy panicles; rhachis of inflorescence slender, glabrous or slightly scabrid; bracts of spikelets \(\frac{1}{3}\)—\(\frac{1}{3}\) in. long, sessile or pedicellate, cymbiform, green, striate, with aristulate tip. Spikes longer or shorter than the bracts, with rounded base. Sessile spikelets \(\frac{1}{5}\)—\(\frac{1}{3}\) in. long; lower invol.-glume spreading, strict or recurved, bicuspidate, with hyaline margins; upper floral glume 3-5-nerved below the sinus, the lateral nerves arching and meeting the midnerve at the insertion of the awn. Fl. B. I. v. 7, p. 150; Trim. Fl. Ceyl. v. 5, p. 226; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 437; Prain, Beng. Pl. p. 1194.—Flowers: Oct.—Dec. Vern. Ghayara.

Konkan: Law!, Woodrow. Decean: Woodrow, 115! S. M. Country: Belgaum, Ritchie, 824! Gujarat: Surat, Cooke!; Ahmedabad, Cooke!—Distrib. Throughout India; Ceylon, E. Trop. Asia, Malaya, Australia, Pacific Islands.

Hackel divides the forms of this variable plant into 2 subspecies—one mutica, which is rarely awned; the other aristata, the spikelets of which are always awned. Of aristata Hackel has 4 varieties, to the first of which, aristata proper, most of the Bombay specimens are referable.

24. ISCHÆMUM, Linn.

Annual or perennial grasses. Leaves narrow. Racemes solitary, digitate or fascicled, articulate, fragile; internodes of rhachis and the pedicels of the upper spikelets trigonous, hollowed ventrally. Spikelets 2-nate, one sessile and one pedicellate, the pedicellate spikelet often dissimilar from the sessile. Sessile spikelets: glumes 4; invol.-glumes subequal, coriaceous or chartaceous, awnless or the upper sometimes awned; lower invol.-glume ovate-oblong or oblong-lanceolate, convex, more or less marginally winged above the middle; upper invol.-glume lanceolate, acuminate, concave; lower floral glume hyaline, paleate, triandrous, with a narrow lanceolate acuminate 2-nerved palea; upper floral glume hyaline, usually deeply 2-cleft, awned, the awn geniculate with a brown twisted column. Lodicules cuneate or quadrate. Stamens 3; anthers linear. Styles long; stigmas short. Pedicellate spikelets with pedicel half as long as the sessile spikelet or shorter; upper floral glume rarely awned.—Distrib. Species about 40, chiefly tropical.

Racemes 2-3 (rarely more); lower invol.-glume dorsally flat, not channelled or depressed along the median line. Margins of lower invol.-glume of sessile spikelets nar-

rowly inflexed or incurved from base to apex.

Leaves rounded at the base (slightly cordate in L. molle), sessile on the sheath.

Pedicel of upper spikelet less than I the length of the lower spikelet.

ridged nor with nodulose margins

2. I. rugosum.

1. I. aristatum,

3. I. molle.

Pedicel of upper spikelet & the length of the lower spikelet or more. Stems woolly at the base 4. I. angustifolium. Stems not woolly at the base, Upper invol.-glume of sessile spikelets 2-fid, 3-nerved; lateral nerves pectinately ciliate at the apex б. I. diplopogon, Upper invol.-glume of sessile spikelets acuminate, 5-nerved; lateral nerves anastomosing, not pectinately ciliate. 6. I. pilosum. Leaves hastate or deeply cordate at the base, petin-7. I. semisagittatum. Margins of lower invol.-glume of sessile spikelets broadly incurved below the middle. Sessile spikelets ! in. long; callus large, glabrous; 8. I. Lishne. I. ciliare. deeply channelled or depressed along the median line. Racemes enclosed in long narrow spathes 10. I. spothistorum. Racemes not enclosed in spathes. Lower invol.-glume of sessile spikelets 6-nerved; upper invol.-glume of pedicellate spikelets shortly awned. 11. I. laxum. Lower invol.-glume of sessile spikelets 2-nerved; upper

invol.-glume of pedicellate spikelets not awne 1 12. I. sulcatum.

1. Ischæmum aristatum, Linn. Sp. Pl. (1753) p. 1049. Perennial; stems 1-4 ft. high, stout, erect or decumbent at the base, simple or branched above, leafy, glabrous, thickened at the top below the spikes. Leaves 4 10 by 4-1 in., linear-lanceolate, finely acuminate, glabrous or sparsely hairy, glaucous beneath, narrowed to the acute or subcordate base, with scabrid margins; sheaths loose, glabrous, the mouth naked, nuricled: ligule membranous. Racemes 1 or 2, stout or slender, 1-4 in. Spikelets reaching 1 in. long, a sessile and a pedicellate closely pressed together; callus of sessile spikelets broad, thick, in long. Sessile spikelets: lower invol.-glume 1 in. long, broadly oblong, cartilaginous and often purplish below the middle, with 2-4 marginal nodules on each edge transversely connected by shallow ridges, thinner above the middle, with green anastomosing veius, tip obtuse or 2-dentate, margins narrowly incurved, ciliolate; upper invol.-glume lanceolate, acuminate, 1-nerved, with smooth rounded keel; lower floral glume ovate lanceolate, acuminate, 1-nerved, membranous, male or 2-sexual, with an oblong palea; upper floral glume female, cleft to or below the middle into lanceolate asyminate lobes, with a brownish-red awn & in. or more long at the sinus, twisted below, straight above; palea linearoblong. Pedicellate spikelets as long as the sessile, inarticulate on the very thick amorphous pedicel, which is densely silky-hairy at the base; lower invol.-glume gibbons or scimitar-shaped, acute, corinceous, tinged with purple, with a ciliolate semicircular wing; upper invol.-glume and lower floral glume as in the sessile spikelets: upper floral glume hyaline, with a mucro or very short awn. Fl. B. I. v. 7, p. 126; Grab. Cat. p. 239; Dalz. & Gibs. p. 306; Trim. Fl. Ceyl. v. 5, p. 211; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436; Prain, Beng. Pl. p. 1195 .-Flowers: Oct.-Dec. VERN. Bherda; Guj.

2. Ischæmum rugosum, Salisb. Ic. Stirp. Rar. (1791) p. 1, t. 1. Annual; stems 1-2 ft. long, erect or ascending, slightly thickened beneath the inflorescence, leafy, compressed; nodes glabrous or bearded. Leaves 4-6 by $\frac{1}{6}$ in., linear-lanceolate, acuminate, flat, glabrous or sparsely hairy, the margins scabrid, the uppermost leaves often reduced to spathiform lanceolate sheaths which partially enclose the racemes; sheaths compressed, loose, glabrous, the mouth auricled, the auricles membranous, confluent with the truncate ligules. Racemes usually 2, erect, pale yellow, glabrous, 1-3 in. long, fragile; rhachis trigonous, ciliate on the dorsal angle. Spikelets reaching 1 in. long or more, linearoblong, the sessile and pedicellate closely pressed together; pedicel of the latter very short and thick, clavate, angular, confluent with the bristly thick callus of the sessile spikelet. Sessile spikelets: lower invol.glume cartilaginous for 3 of its length from the base, the cartilaginous portion pale yellow, shining, concave, crossed by 3-6 deep smooth ridges, the upper third flattened, thinner, membranous, obtuse, with green veins, the margins narrowly incurved, the outer margin winged; upper invol.glume oblong-lanceolate, acuminate, keeled, the keel with a narrow ciliolate wing below the tip; lower floral glume ovate-lanceolate, acuminate, hyaline, male or empty, paleate, the palea hyaline, narrow; upper floral glume & in. long, deeply cleft into 2 acute lanceolate lobes; palea linear-lanceolate; awn reaching 5 in long or more. Pedicellate spikelets variable, rather shorter than the sessile; lower invol.-glume like that of the sessile or with fewer or sometimes more or less obscure transverse ridges, the upper half of the glume broader and more oblique; upper invol.-glume not keeled, otherwise as in the sessile spikelet; lower floral glume as in the sessile; upper floral glume oblong, obtuse, not awned. Fl. B. I. v. 7, p. 127; Grah. Cat. p. 239; Dalz. & Gibs. p. 305; Trim. Fl. Ceyl. v. 5, p. 212; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436; Prain, Beng. Pl. p. 1195; Watt, Diet. Econ. Prod. v. 4, p. 531. Flowers: Oct.

DECCAN; Poona, Woodrow.—Distrib. Throughout India; Ceylon, China, Malaya.

3. Ischæmum molle, Hook. f. Fl. B. I. v. 7 (1896) p. 128. Stem 3-4 ft. long, solid, smooth, stout, leafy. Leaves 6-10 by $\frac{1}{4}$ - $\frac{1}{3}$ in., linear, finely acuminate, sparsely hairy, base rounded, cordate; sheaths 4-6 in. long, smooth, glabrous or sparsely hairy above, the mouth villous. Racemes 1-2, axillary and terminal, 3-5 in. long, densely villous with soft white hairs. Spikelets reaching \(\frac{1}{2} \) in. long; callus of sessile spikelets very short and broad. Sessile spikelets: lower invol.-glume thinly coriaceous, broadly ovate, obtuse, dorsally villous all over, many-nerved; upper invol.-glume chartaceous, obtuse, silky, keeled, the keel with a narrow ciliolate wing from the middle upwards; lower floral glume ovate, obtuse, hyaline, 3-nerved, ciliolate, paleate, the palea as long as the glume, narrow, obtuse; upper floral glume shorter than the lower one, cleft to the middle into 2 lanceolate acuminate ciliolate lobes; palea small; narrow; awn nearly 3 in. long, the lower half dark brown, the upper half yellowish-white. Pedicellate spikelets rather smaller than the sessile, with similar glumes but awnless. Woodr. in Journ. Bomb. v. 13 (1901) p. 436.—Flowers: Oct.-Dec.

DICCAN: Lanoli, Woodrow.

There is but one sheet from the Bombay Presidency in Herb. Kew. from Dalzell's Herbarium, but no locality is given for the plant. There is one other small specimen of the plant in the Kew Herbarium, collected in the Chanda district, Central Provinces, by Mr. Duthic.

4. Ischæmum angustifolium, Hack. Monog. Andropog. in DC. Monog. Phan. v. 6 (1889) p. 241. Perennial; stems tufted, woolly at the base, 2-3 ft. high, erect, slender, sparingly branched, grooved on one side, glabrous. Leaves 1-2 ft. by $\frac{1}{10}$ $\frac{1}{6}$ in., tapering into a subpungent acumen, concave or convolute, base obtuse, fimbriate, margins scaberulous; sheaths glabrous; ligule a tuft of short hairs. Racemes 2-4, on axillary and terminal filiform peduncles, 1-2 in. long, close or distant, erect, golden or rusty-villous; joints and pedicels $\frac{1}{2}$ as long as the lower spikelet, slender, shortly ciliate, the pedicels bearded at the base. Sessile spikelets & in. long, lanceolate; callus short, hairy. Glumes 4; lower invol.-glume in in. long, elliptic-oblong, chartaceous, 2-3-toothed, 5-nerved, the lower part of the glume ciliate with long rufous hairs and also with a tuft of hairs at the middle of the lower part of the back; upper invol.-glume of in. long, membranous, ovate-lanceolate, 2-dentate, often mucronate between the teeth, 3-5-nerved; lower floral glume equalling the lower invol.-glume, oblong, obtuse, irregularly 2-dentate, hyaline, nerveless, paleate, the palea a little shorter than the glume, linear, 2-dentate; upper floral glume 1 in. long, linear, hyaline, usually 2-dentate, but sometimes only acute at the apex; palea shorter than the glume; awn reaching 3 in. long. Pedicellate spikelets like the sessile. Fl. B. I. v. 7, p. 120; Woodr, in Journ, Bomb. Nat. v. 13 (1901) p. 436; Prain, Beng. Pl. p. 1195; Watt, Diet. Econ. Prod. v. 4, p. 526.—Flowers: Dec.-Feb. VERN. Sabai.

Decean: cultivated at Poona, Woodrow. Gujanar: Rajkot (Kathiawar), Woodrow. —Distrin. India (Lower Himalaya, Panjab, Rajputana, Behar, Central India);

Afghanistan, China, Philippines.

The grass was cultivated at Poons for paper-making by the Decean Paper Mills. It was found suitable for the lower grades of paper, but for the higher grades was not satisfactory. The nodes are hard, and if boiled long enough to soften them the remaining parts are overboiled and useless.

5. Ischæmum diplopogon, Hook. f. Fl. B. J. v. 7 (1896) p. 129. Annual; stem 12-20 in. long, branched from the base and upwards; nodes glabrous; internodes long. Leaves 3-6 by $\frac{1}{4}$ - $\frac{5}{8}$ in., linear-lanceolate from a narrow base, acuminate, with many slender nerves, dark green and shining above; sheaths glabrous, those of the upper leaves open, spathiform; ligule an oblong glabrous membrane. Pedancles many from the upper spathe-like sheaths, solitary, filiform, the spathes 1-3 in. long, lanceolate. Racemes usually 2, compressed, 1-13 in. long; joints and pedicels ! the length of the lower spikelets or longer, subclavate, dorsally rounded, ventrally concave. Sessile spikelets: callus nearly in long, thick. Spikelets reaching 1 in long. Glumes 4; lower invol.-glume 1 in. long, oblong, shortly 2-cuspidate, obscurely nerved and with shortly incurved margins; upper invol.-glume \(\frac{1}{2}\) in. long, ovate, subacute, shortly 2-fid, 3-nerved, the lateral nerves pectinately ciliate near the apex with long erect hairs and furnished with a slender whitish awn 1 in. long; lower floral glume linear-oblong, hyaline, 1-nerved; upper floral glume 1 in. long, 2-fid at the apex into acute lobes, hyaline;

palea small, oblong; awn reaching $\frac{5}{8}$ in. long, the lower half brown, the upper yellowish white. *Pedicellate spikelets* often imperfect, not awned. Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 436.

6. Ischæmum pilosum, Hack. Monog. Andropog. in DC. Mon Phan. v. 6 (1889) p. 240. Rhizome giving out densely scaly long stolons stems erect, 2-3 ft. long, slender, terete, glabrous; nodes glabrous. Leaves 6-12 by $\frac{1}{5}$ - $\frac{1}{3}$ in., linear, finely acuminate, glabrous; sheaths glabrous; ligule rounded, $\frac{1}{12} - \frac{1}{8}$ in. long, membranous, glabrous. Racemes 2-6, fascicled, 1-4 in. long, yellow or brownish, pilose; rhachis hairy; joints and pedicels slender, compressed, subclavate, shorter than the sessile spikelets, sparsely ciliate; pedicel about \(\frac{1}{2} \) as long as its spikelet. Sessile spikelets narrowly lanceolate, reaching \frac{1}{4} in. long; callus minute, bearded with long hairs. Glumes 4; lower invol.-glume chartaceous, narrowed from the middle upwards, dorsally hairy, the margins incurved throughout their whole length, the nerves anastomosing; upper invol.-glume rather longer than the lower, chartaceous, ovate-lanceolate, acuminate, laterally compressed, 5-nerved, the lateral nerves anastomosing; lower floral glume a little shorter than the upper invol.-glume, linear-oblong, obtuse. ciliate above, paleate, male, the palea acute, membranous, nerveless, glabrous; upper floral glume equalling the lower one, cleft almost to the middle into acute ciliolate lobes; palea a little shorter, lanceolatesubulate, nerveless; awn $\frac{1}{4} - \frac{3}{8}$ in. long. Pedicellate spikelets $\frac{1}{6} - \frac{1}{5}$ in. long, like the sessile but usually with a shorter awn, sometimes imperfect or reduced to a single glume. Fl. B. I. v. 7, p. 130; Grah. Cat. p. 239; Dalz. & Gibs. p. 305; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436; Watt, Dict. Econ. Prod. v. 4, p. 531.—Flowers: Oct.-Mar. VERN. Kunda: Nuth.

KONKAN: Stocks!, Woodrow. KANARA: Divimana, Woodrow.

8. Ischæmum Lisboæ, Hook. f. Fl. B. I. v. 7 (1896) p. 133. Stem creeping below, very stout, rooting at the thickened nodes; branches ascending, 8-14 in. long, glabrous. Leaves on the creeping stem 1-2 by $\frac{1}{4}$ - $\frac{3}{8}$ in., oblong, acute, closely imbricating in 2 series, the blades reflexed at right angles to the erect short open sheaths, softly tomentose on both surfaces; lower sheaths 1-1 in. long, villous; ligule short, bearded with very long hairs. Racemes 2, softly tomentose, 2 in. long; joints and pedicels about 1 as long as the spikelets, stout, shortly villous, concavo-convex, truncate. Sessile spikelets \(\frac{1}{8}\) in. long; callus large, glabrous. Glumes 4; lower invol.-glume thickly coriaceous, dorsally convex, 2-fid, ciliate above the middle, margins broadly incurved below the middle, keels with broad auricular ciliate wings; upper invol.glume 1 in. long, rather longer than the lower, rigid, the keel winged above the middle, the back of the glume rounded below the wing, shortly awned; lower floral glume ovate-oblong, obtuse, with ciliate margins, paleate, male, the palea chartaceous, obovate, with broad hyaline wings above the middle; upper floral glume about $\int_{\mathbb{R}^2}^1$ in. long, 3-nerved below the middle, obtusely 2-lobed; palea lanceolate; awn about 1 in. long. Woodr, in Journ. Bomb. Nat, v. 13 (1901) p. 436.

KANNA: North Kanara, Lisboa. There is but one sheet in Herb. Kew., the specimens on which were collected in Kanara by Dr. Lisboa. I have seen no others.

9. Ischæmum ciliare, Retz. Obs. fasc. 6 (1791) p. 36. Stems tufted, up to 2 ft. long, erect or ascending, sometimes decumbent below and rooting at the nodes, slender; nodes glabrous or bearded. Leaves 2-6 by $\frac{1}{6}-\frac{1}{2}$ in., linear or linear-lanceolate, acuminate, flat, sessile, glabrous, pubescent or villous, narrowed towards the acute or rounded base, margins scabrid; sheaths glabrous or hirsute, compressed, loose, with ciliate rounded auricles; ligule short, obtuse, membranous, ciliate. Racemes 2, rather short, $1\frac{1}{2}-2$ in. long; rhachis fragile; internodes and pedicels of upper spikelets subequal, erect, compressed, trigonous, bearded dorsally and on the angles. Sessile spikelets $\frac{1}{6}-\frac{1}{6}$ in, long, oblong

or ovoid; callus very short, oblong, bearded. Glumes 4; lower invol.glume 2-cuspidate, coriaceous, convex, smooth or pitted, hirsute below, flatter and veined above the middle, with lateral ciliolate broad or narrow equal wings, the margins narrowly incurved above, broadly so below; upper invol.-glume as long as or longer than the lower, chartaceous, lanceolate, acuminate or shortly awned, 3-5-nerved, keel narrowly winged towards the tip; lower floral glume ovate-lanceolate, acuminate, ciliate near the tip, triandrous, paleate, the palea lanceolate, acuminate, opaque, with broad hyaline ciliolate wings; upper floral glume cleft to the middle into oblong obtuse glabrous or ciliate lobes, female; palea lanceolate, acuminate, 2-nerved, not ciliolate; awn $\frac{3}{8} - \frac{1}{2}$ in, long. Anthers $\frac{1}{8}$ in. long. Styles and stigmas short. Pedicellate spikelets like the sessile, the upper floral glume usually awned. Fl. B. I. v. 7, p. 133; Trim. Fl. Ceyl. v. 5, p. 216; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 437; Prain, Beng. Pl. p. 1195; Watt, Dict. Econ. Prod. v. 4, p. 530. VERN. Putena. -Flowers: Oct.

Konkan: Salsette, Jacquemont, 710!; Parel (Bombay), Woodrow. Kanana: Dalzell!; Kakti (N. Kanara), Young ex Woodrow.—Distrib. More or less throughout India; Ceylon, China, Malaya, Australia.

10. Ischæmum spathiflorum, Hook. f. Fl. B. I. v. 7 (1896) A tall grass reaching 3-4 ft. high, much branched above; branches erect. Stem as thick as a goose-quill below, leafy above; nodes glabrous. Leaves $1-1\frac{1}{2}$ ft. by $\frac{3}{4}$ in., linear-lanceolate, finely acuminate, narrowed from the middle, often tinged with purple, almost petiolate, thin, sparsely hairy, margins smooth; midrib stout, nerves obscure; sheaths of lower leaves 6 in. long and upwards, terete, quite glabrous, the sheaths of the upper leaves passing into compressed lanceolate flowering spathes 3-4 in. long; ligule short, scarious. about 2 in. long, more or less exserted from the spathes, very slender, pale straw-colored; joints and pedicels more than $\frac{1}{2}$ as long as the sessile spikelets, compressed, one angle ciliate. Sessile spikelets $\frac{3}{8}$ in. long, narrowly linear-lanceolate; callus very short, hairy; lower invol.-glume $\frac{3}{8}$ in. long, thinly coriaceous, nerveless, white with dense silky hairs to above the middle, dorsal furrow very deep, causing a thick ridge on the inside of the glume, margins equally incurved, the tip 2-dentate; upper invol.-glume chartaceous, dorsally convex, nerveless, but with a nervelike fold towards the ciliate margin, keel with long cilia above the middle, scabrid towards the emarginate tip; lower floral glume shorter, hyaline, oblong-lanceolate, obtuse, 3-nerved, paleate, the palea lanceolate, the anthers imperfect; upper floral gluine as long as the lower, linear, 3-nerved; palea 0; awn $1\frac{1}{2}$ in. long, the column twisted, brown, the upper portion slender, usually purple. Pedicellate spikelets longer than the sessile; lower invol.-glume \frac{1}{2} in. long, dorsally convex, not furrowed lanceolate, narrowed into a bisetose often purplish awn, sparsely silky, 7-9-nerved; upper invol.-glume lanceolate, acute, glabrous; lower floral glume as in the sessile spikelet; upper floral glume awnless. Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 437.—Flowers: Sept.

· Konkan: Island of Salsette in hilly stony places, Jacquemont, 797! Deccan: Khandala, Woodrow!; Palasdari on the Bhore Ghát (G. I. P. Railway), Woodrow.—Distrib. India (W. Peninsula), apparently endemic.

3 R 2

11. Ischæmum laxum, Br. Prodr. (1810) p. 205. Perennial; stems 2-3 ft. high, tufted on a short rootstock, simple, slender, erect, glabrous, leafy; nodes glabrous. Leaves 6-12 by 10-6 in. erect, linear, narrowed to long capillary tips, flat, smooth, striate, glaucous, with minutely scaberulous margins, base not contracted; sheaths shorter than the internodes, glabrous or sparsely hairy, not auricled at the mouth; ligule a tuft of silky hairs. Raceme solitary, 2-4 in. long, subcreet, pale, fragile; internodes and pedicels of upper spikelets about as long as the spikelets, concavo-convex, the sides ciliate with long silky hairs. Sessile spikelets a in. long, linear-oblong, acuminate, pale green; callus short, obtuse, shortly bearded. Glumes 4: lower invol.glume oblong-lanceolate, acuminate, with a broad depression in the middle instead of a midnerve, the tip 2-dentate, the feeth ending in short capillary awns, margins inflexed, nerves 6, very conspicuous on the back, the 2 lateral nerves very strong, running into the apical teeth, the 4 intermediate nerves diverging from the base in pairs, afterwards more or less converging; upper invol.-glume rather shorter than the lower, membranous, ovate-oblong, acuminate, concave, terminating in a slender awn reaching 1 in, long, the margins ciliate near the spex, nerves 3, very slender; lower floral glume lanceolate, acuminate, hyaline, nerveless, triandrous, paleate, the palea linear-oblong, obtuse; upper floral glume in, long, linear, hyaline, deeply cleft into 2 lanceolate-subulate lobes, female; palea linear-oblong, equalling the glume; awn up to 13 in. long, the lower 1 in. brown, the upper 3 in. white. Pedicellate spikelets as long as the sessile; lower invol.-glume 2 in. long, ovate-oblong, bicuspidate, 7-nerved, the nerves very conspicuous on the back; upper invol-glume 1-nerved, shortly awned; lower floral glume as in the sessile spikelet; upper floral glume triandrous, not awned. Fl. B. I. v. 7, p. 136; Trim. Fl. Ceyl. v. 5, p. 219; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 437; Prain, Beng. Pl. p. 1196; Watt, Diet. Econ. Prod. v. 4, p. 531.—Flowers: Sept. Vinn. Sheda: Pannat.

Common throughout the Presidency. Dream: Khandesh (used for thatching), Lisbon; Poona, Woodrow; Poona to Karli, Jacquemont, 550 !—Distain. India (Bengal. Behar, Central Provinces, W. Peninsula); Ceylon, Australia, Cape de Verd Islands.

12. Ischemum sulcatum, Hack. Monog. Andropog. in DC. Monog. Phan. v. 6 (1889) p. 248. Stems geniculate, ascending, reaching 20 in. long or more, weak, terete, glabrous, not ribbed, much branched from the base; nodes glabrous. Leaves 4-8 by 1 in., linear or lanceolate, setaceously acuminate, many-nerved, glaucous, glabrous; sheaths lax, glabrous, constricted at the mouth; ligule a narrow ciliate membrane. Raceme solitary, 2-3 in. long; joints and pedicels shorter than the sessile spikelet, slender, ciliate. Sessile spikelets & in. long; callus about 16 in. long, shortly hairy at the base, cuneate; lower invol.-glume 3 in. long, subchartaceous, bicuspidate, lanceolate, scabro-punctate, the margins incurved in the upper, open in the lower part, with a furrow in the middle in the place of the midnerve and 2 nerves one at each side of and close to the furrow; upper invol.-glume rather shorter than the lower, chartaceous, 3-5-nerved, shortly 2-dentate, ciliate in the upper part and with a capillary awn 3 in. long from the sinus; lower floral glume 1 in. long, linear, subacute, with incurved margins, hyaline, paleate, the palea as long, oblong, slightly emarginate; upper floral

glume \(\frac{1}{4} \) in. long, divided into 2 acute lobes; palea as long as the glume; awa \(\frac{3}{4} - 1 \frac{1}{2} \) in. long, the column brown, twisted, geniculate above the column, the upper part pale, scaberulous. Pedicellate spikelets smaller than the sessile, awaless; lower invol.-glume lanceolate, bicuspidate, not furrowed, the margins recurved throughout, 7-nerved, the midrib slender, the lateral nerves green, approximate, close to the margin; upper invol.-glume not awared; lower floral glume as in the sessile spikelets; upper floral glume acute, not awared. Fl. B. I. v. 7, p. 137; Woodrow, in Journ. Bomb. Nat. v. 13 (1901) p. 437.—Flowers: Oct.

DECCAN: Sattara, Lishoa; Malsiras (Sholapur taluka), Lishoa,—Distrib. India-(Central Provinces, W. Poninsula).

25. POGONATHERUM, Beauv.

Delicate perennial grasses; stems leafy upwards, branching. Leaves narrow, suberect. Racemes solitary on long flexuous peduncles, plumose from the slender awns; rhachis at length fragile; internodes short. Spikelets very small, subterete, 2-nate, 1-2-flowered, a sessile 2-sexual, and a pedicellate male or neuter (rarely 2-sexual); callus bearded with fine hairs. Glumes 3 or 4, all membranous and hyaline, obscurely nerved or nerveless; lower invol.-glume oblong, truncate, dorsally rounded; upper invol.-glume longer, ovate, keeled, 2-fid and awned in the sinus, the awn much longer than the spikelet, slightly twisted; lower floral glume nearly as long as the upper invol.-glume, not awned, usually absent from the pedicellate spikelet; upper floral glume about 1 as long as the upper invol.-glume, 2-fid and awned in the sinus like the upper invol.-glume; palea broadly oblong, not keeled. Lodicules obsolete. Stamens 1 or 2; anthers long. Ovary narrow; styles short, free; stigmas very long, exserted at the top of the spikelet. Grain narrow, oblong, free.—Distrib. India, Afghanistan, China, Malaya, New Hebrides.

1. Pogonatherum crinitum, Kunth, Enum. Pl. v. 1 (1833) p. 478. Stems 6-12 in. long, densely tufted. Leaves 1-3 by $\frac{1}{10}$ in., linearlanceolate, acuminate, more or less hairy; sheaths lax, glabrous with a hairy mouth; ligule of long hairs. Racemes terminating the branches of the stem, 3-1 in. long; rhachis slender; internodes short, ciliate; tips thickened, truncate. Spikelets $\frac{1}{12}$ in. long, usually monandrous; hairs of callus longer than the spikelets. Glumes nerveless, hyaline; lower invol.-glume oblong, dorsally rounded, ciliate at the rounded or retuse tip; upper invol.-glume longer than the lower, ovate, keeled. 2-fid, the lobes ciliolate, awned in the sinus with a long capillary awn in. long or more; lower floral glume linear, nearly as long as the upper invol.-glume, not awned, sometimes absent; upper floral glume cleft to the middle into 2 ciliolate lobes; awn straight or recurved, 3 in. long. Fl. B. I. v. 7, p. 141; Trim. Fl. Ceyl. v. 5, p. 222; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 437; Prain, Beng. Pl. p. 1197. Payonatherum succharoideum var. a. genuinum, Hack. Monog. Andropog. in DC. Monog. Phan. v. 6 (1889) p. 193 .- Flowers: July.

KANARA: Sampkand (N. Kanara), Woodrow.—Distrib. More or less throughout India; Afghanistan, China, Malaya, New Hebrides.

Pogonatherum saccharoideum, Benuv. Agrost. (1812), Expl. des Pl. p. 9, t. 11, fig. 7. The Bamboo Grass sometimes grown in gardens, scarcely distinct from P. crinitum, which Hackel makes a variety of P. saccharoideum. Fl. B. I. v. 7, p. 141; Trim. Fl. Ceyl. v. 5, p. 222; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 437; Prain, Beng. Pl. p. 1197.

26. LOPHOPOGON, Hack.

Small perennial densely tufted grasses. Leaves very narrow. Spikes short, solitary, 2-nate or fasciculate at the ends of capillary branches, fragile. Spikelets usually 2-nate at each node of the rhachis; the upper shortly or very shortly pedicellate, 1-2-flowered, aristate from the upper floral glume; the lower spikelet sessile, 2-flowered, not awned from the upper floral glume; lower invol.-glume of both spikelets 3-4-dentate, 5-7-nerved; upper invol.-glume of same 2-dentate, aristate between the teeth; lower floral glume narrow, hyaline, empty or male; upper floral glume hyaline or membranous, that of the upper spikelet with a long awn, that of the lower spikelet awnless. Lodicules 0. Stamens 2. Styles very short; stigmas exserted from the apex of the spikelet.—Distrib. India and Australia; species 3.

1. Lophopogon tridentatus, Hack. in Engl. & Prantl, Pflanzenfam. v. 2, part 2 (1887) p. 26. Perennial; stems tufted, 4-8 in. high, erect, slender, terete, glabrous. Leaves 2-4 by $\frac{1}{25-16}$ in., linear, acuminate, rigid, erect, green; sheaths close, quite glabrous, striate, shorter than the internodes, the upper ventricose; ligule very small, truncate, hyaline, ciliate. Heads of racemes erect; sheaths ovoid, flattened, membranous, caudate-acuminate. Racemes usually 2, closely appressed together, appearing like one, $\frac{1}{2}$ - $\frac{3}{4}$ in, long, erect, pilose with golden or ferruginous hairs, the peduncle shortly exserted or more or less enclosed in the upper sheath; joints of rhachis very short, slender, glabrous. Spikelets densely imbricate. Lower spikelets reaching \frac{1}{5} in. long, brown when dry, obovate-oblong; callus \frac{1}{36} in. long, obtuse, with a small tuft of ferruginous hairs at the very tip. Glumes 4; lower invol.-glume chartaceous, cuneate-oblong, truncate, with 2 long lateral teeth and 1 or 2 shorter ones between, glabrous on the back, 5-nerved; upper invol.glume 1 in. long, membranous, lanceolate, acute, 3-nerved, hirsute near the apex with ferruginous hairs, and sending out an awn as long as the glume: lower floral glume & in. long, narrowly linear, subacute, hyaline, nerveless, glabrous, epaleate; upper floral glume 1 in. long, lanceolate, entire or 2-fid, hyaline, not awned. Upper spikelets very shortly pedicellate; lower invol.-glume membranous, 3-toothed, clothed with tufts of long bristles below the middle; upper floral glume with a long awn 3 in. long, geniculate about the middle, the column brown, twisted. Fl. B. I. v. 7. p. 149; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 437.—Flowers: Oct.-Dec.

Dalzell without locality in Herb. Kew.! Konkan: Law!, Stocks! Deccan: Woodrow, 56!; Poons, Jacquemont, 541!, Woodrow, Lishoa; Sholapur, Stead ex Hackel, Lishoa. S. M. Country: Belgaum, Ritchie, 882!, Woodrow.—Distrib. India (Contral Provinces, W. Peninsula).

27. APOCOPIS, Nees.

Annual or perennial grasses; stems slender. Leaves narrow, flat. Racemes solitary or 2-3-nate, compressed; rhachis firm, not readily disarticulating; internodes very short, slender, villous. Spikelets secund closely imbricating in 2 series, solitary, sessile, 1-2-flowered, the lowest 2-4 in each raceme imperfect, neuter; callus very short, acute, bearing the long capillary ciliate pedicel of an obsolete upper spikelet. Glumes 4; lower invol.-glume very large, cuneately obovate or obcordate, chartaceous below, membranous above, more or less villous with pale brown or yellow hairs, 7-9-nerved below the apex, margins incurved at the base only; upper invol.-glume as long as the lower, much narrower, membranous, oblong-ovate, truncate, 3-nerved, the sides broadly incurved; lower floral glume and its hyaline palea oblong, the tips broadly truncate and ciliolate, male or empty; upper floral glume 2-sexual, linear, 2-dentate, 1-nerved, hyaline, paleate, awned; palea half as long as the glume, quadrately oblong, nerveless, truncate with ciliolate tip; awn short, very slender, twisted. Lodicules 0. Stamens 2 or 3; anthers linear. Ovary narrow; stigmas slender, exserted at the top of the spikelet. Grain small, narrowly oblong.—Distrib. Eastern Asia; species 3 or 4.

1. Apocopis vaginatus, Huck. in Estr. Bot. Zeitschr. v. 41 (1891). p. 8. A low decumbent annual; stems much branched from the base, 3-8 in. long. Leaves $\frac{3}{4}$ - $\frac{13}{4}$ by $\frac{1}{13}$ - $\frac{1}{8}$ in., linear, acute, shorter upwards, hairy from tubercular bases; sheaths lax, longer than the internodes, hairy at the mouth; ligule a small membrane. Racemes 2-nate, $\frac{3}{4} - \frac{7}{4}$ in. long, closely appressed together, partly or almost entirely enclosed during flowering in the sheaths of the upper leaves, supported by a short common peduncle, more or less hairy with yellowish-brown hairs; joints much shorter than the spikelets, ciliate. Spikelets oblong, 1 in. long, brown, nearly uniform in color; callus very short, hairy with long brown hairs. Glumes 4; lower invol.-glume 1 in. long, membranous, obovate, truncate or emarginate at the ciliate hyaline apex, densely brown hairy in the lower half, 7-9-nerved, the nerves abruptly ceasing below the apex; upper invol.-glume as long as the lower, quadrateoblong, truncate at the hyaline margin, hairy in the lower half, 3-nerved, finely ciliolate at the apex; lower floral glume & in. long, hyaline, linearoblong, obtuse, ciliolate at the apex, nerveless; upper floral glume $\frac{1}{4}$ in. long, conspicuously exceeding the other glumes, linear, membranous, truncate and shortly 2-dentate at the apex, awned; awn perfect, $\frac{7}{8}-1\frac{1}{4}$ in. Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 437. A. Wightis var. vaqinata, Hook. f. Fl. B. I. v. 7 (1896) p. 143.

Konkin: Kalyan, Woodrow. Kanari: N. Kanara, Talbot ex Woodrow.—Distrib. India (Hazaribagh (Bengal), C. B. Clarke).

I have not seen any specimens from the Bombay Presidency.

28. ARTHRAXON, Beauv.

Annual or perennial slender grasses; stems decumbent, creeping and brauching below. Leaves short, broad, cordate at the base; sheaths shorter than the internodes. Racemes 2-nate, digitate or fasciculate; rhachis very slender, articulate, fragile. Spikelets 1-flowered, secund, sessile, solutary or with an imperfect pedicellate spikelet, laterally com-

pressed, deciduous at the internodes; callus bearded. Glumes 4; lower invol.-glume lanceolate or linear-lanceolate, acute, thin or subcoriaceous, more or less muriculate or aculeate, margins hardly incurved; upper invol.-glume narrower, lanceolate, acuminate, chartaceous, keeled; lower floral glume hyaline, paleate, empty; upper floral glume hyaline, awned or mucronate, bisexual; palea minute or 0. Lodicules 2, cuneate or quadrate. Stamens 1-3. Styles short; stigmas laterally exserted. Grain linear or narrowly fusiform.—Distrib. Tropics of the Old World; species 8.

Awn of spikelets less than 1 m. long; joints of rhachis of racemes rectangularly truncate. Stamens 3; anthers nearly as long as the upper floral Spikelets all sessile (not pedicellate) 1. A. inermis. Spikelets se sile and pedicellate. Tall, reaching 3 ft. high; joints of rhachis sparsely hairy, lower invol.-glume acuminate 2. A. lanceolatus. A weak grass reaching I ft. high; joints of rhachis densely clothed with silvery bairs, lower invol. glume 2-fid 3. A. Mecboldii. Stamens 2 or 3; anthers not & the length of the upper floral glume. Lower invol -glumo 2-fid. 4. A. microphyllus. Lower myol -glume entire 5. A. ciliaris. Awn of spikelets 6 in. or more long; joints of rhachis of

6. A. jubatus.

1. Arthraxon inermis, Hook. f. Fl. Bl. I. v. 7 (1896) p. 145. Stems very slonder, much geniculately branched, glabrous; nodes pubescent. Leaves 1-1½ by §-§ in., ovate, broadly amplexicaul, caudate-acuminate with setaceous tips, glabrous or sparsely bairy on both sides, ciliate near the base. Spikes often 3, short, green; peduncle slender, naked. Spikelets oblong-lanceolate, all sessile (none pedicellate), rather distant. Glumes 3 or 4; lower invol.-glume dorsally convex, obtuse, oblong-lanceolate, strongly 7-9-nerved, the margins not incurved and as well as the nerves scabrid; upper invol.-glume as long as the lower, obovate-oblong (when spread out), obtuse, emarginate, apiculate, 3-nerved, hardly keeled, nearly smooth; lower floral glume 0 (or palea of upper floral glume) shorter than the upper invol.-glume, lanceolate; awn basal, twice as long as the spikelets. Anthers very large. Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 437.—Flowers: Oct. Venn. Vanguarin.

racemes obliquely truncate

KONKIN: Matheran, Woodrow. Diccan: Woodrow, 189!; Mahableshwar, Woodrow. — Distrain. India (W. Peninsula).

There is a single and not very good specimen in Herb. Kew. collected by Woodrow and ticketed "Decean." I have seen no other. The grass seems to be procurable at Matheran and Mahableshwar, both places of easy access, and a few specimens would be highly acceptable at Kew.

2. Arthraxon lanceolatus, Hachst. in Flora, v. 29 (1856) p. 188. A tall much-branched suberect or subscandent grass 1-3 ft. high; stems slender, quite glabrous or scaberulous below the nodes; floriferous branches usually elongate, solitary or twin. Leaves glaucous, very variable, from broadly ovate and ½-3 by ½-1; to narrowly lanceolate and 1-4 by ½-½ in., caudate-acuminate, flaceid or rigid, glabrous or hairy, the margins ciliate with stiff hairs, the nerves slender, obscure; sheaths close; ligule ½-½-½ in. long, rounded, membranous. Ravemes 2-5-nate,

1-2 in. long, pale green or suffused with violet; rhachis sparsely harry; joints about \(\frac{1}{2} \) as long as the spikelets. Sessile spikelets \(\frac{1}{4} \) in. long (not including the awn), linear-lanceolate; callus very short, not bearded. Glumes \(4; \) lower invol.-glume \(\frac{1}{4} \) in. long, lanceolate, acuminate, corraceous, often purplish with a hyaline tip, the keels serrately bristly with strong curved teeth, the back convex, glabrous or muriculate, 5-7-nerved, with incurved margins; upper invol.-glume similar, lanceolate, acuminate or mucionulate, 3-nerved, with incurved margins; lower floral glume \(\frac{1}{6} \) in. long, acute, glabrous, membranous: upper floral glume hyaline; awn \(\frac{1}{2} - \frac{2}{6} \) in. long, ba-al, the column equalling the subulate portion. Antheis more than \(\frac{1}{6} \) in. long. Pedicellate spikelets \(\frac{1}{2} \) in. long, linear-lanceolate. Stamens perfect. Fl. B. I. v. 7, p. 143; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 437; Prain, Beng. Pl. p. 1198.—Flowers. Oct. Vern. Harjala; Govinder.

Decens Landi, Woodrow. Gujarat, Morvi (Kathiawar), Woodrow Sind: Stocks, 642'-Distrib More or less throughout India, Abyssinia, Tonkin, China

3. Arthraxon Meeboldii, Stapf, MS. Annual; stems 2-3 from the base, shortly prostrate, ascending, 6-12 in. long, slender, terete, quite glabrous, often tinged with purple; nodes pubescent. Leaves $\frac{1}{4}$ -2 by $\frac{1}{4}$ - $\frac{3}{4}$ in , ovate lanceolate, finely acuminate, very spaisely hairy with slender bulbous-based hairs, given above, glaucous beneath, ciliate on the margins with bulbous-based hairs, base cordate, amplexicaul; sheiths of the lower leaves loose, the others close or the upper more or less tumid, at first enclosing the panicles, glabious or with a few scattered hairs and more or less ciliate margins; ligule about 🗓 in. long, quadrate, hyaline, shortly ciliate at the apex. Inflorescence of paniculate racemes at the apex of the stems; branches 2-4, reaching 2 m. long; joints of the rhachis about & m. long, densely clothed with long silvery hairs; pedicels $\frac{1}{8}$ in. long, broad. Sessile spikelets $\frac{1}{4}-\frac{3}{8}$ in. long, narrowly linear-lanceolate; callus minute, bearded. Glumes 4: lower invol.-glume when young sometimes silky all over with a deciduous tomentum, linear-lanceolate, chartaceous, with a purphsh 2-fid acumen with very narrow teeth and with incurved margins, keels seriately muricate from the base up to I of their length, the munications passing into tubercles which, in the upper third of the glume, are ciliate with fine eject silky hairs; upper invol.-glume oblong-lanceolate, setosely acuminate, membranous, equalling the lower one, 3-nerved, with hyaline margins; lower floral glume empty, elliptic-oblong, subobtuse, 1 in. long, nerveless; upper floral glume linear-lanceolate, acute, rather more than 1 in. long, hyaline, aristate from near the bise, the awn 1 in. long or more. Pedicellate spikelets closely appressed to the sessile ones, lanceolate, acute, chartaceous, shorter than the sessile spikelets; lower invol-glume with rigidly chate keels, otherwise glabrous, 9-nerved; upper invol.-glume lanceolate, acute, 3-nerved; lower floral glume empty, ovate-oblong, hyaline, in. long; upper floral glume ovate, 2-dentate, equalling the lower, mucronulate between the teeth, hyaline, male. Anthers 1 in. long, bright yellow.-Flowers: Sept.

The long silky silvery hairs on the racemes are a good distinctive

mark of the species.

Decear : Khundal I, Meebold, 9132; Mahableshwar, Cooke!-Distrib India (W. Pennsula).

4. Arthraxon microphyllus, Hochst. in Flora, v. 29 (1856) p. 188. Annual; stem and branches filiform, 6-12 in, long, straggling, glabrous or more or less obscurely pubescent below the spikes. Leaves 3-11 by 1-1 in., ovate or elliptic, acuminate, membranous, very sparingly hairy or nearly glabrous, base slightly auricled, margins naked or sparsely ciliate especially towards the base; sheaths short, glabrous; ligule small, hyaline. Panicle of 3-5 slender branches; rhachis capillary; internodes shorter than the slender spikelets, usually ciliate with long erect hairs (rarely glabrous). Spikelets solitary (rarely with a pedicellate one), in long, narrowly lanceolate; callus nearly glabrous, Glumes 4; lower invol.-glume thinly membranous, lanceolate, 2-cuspidate, 5-7-nerved above the middle, the nerves usually scabrid; upper invol.-glume as long as the lower, narrowly lanceolate, narrowing out into a very fine awn-like point $\frac{1}{30-30}$ in, long; lower floral glume much shorter than the upper invol.-glume, lanceolate, acuminate, epaleate; upper floral glume 20 in. long, ovate-lanceolate, subacute, hyaline, with an awn about 3 in. long from near the base, the column of the awn brown, much shorter than the usually purplish capillary subulate Fl. B. I. v. 7, p. 147; Trim. Fl. Ceyl. v. 5, p. 224; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 437; Prain, Beng. Pl. p. 1199 .-Flowers: Sept.

Konkan: Salsette, Jacquemont, 7131; Parel (Bombay), Woodrow. Gujaust: Surat, Cooke!—Distrib. More or less throughout India; Coylon, Tonkin, Tropical Africa.

5. Arthraxon ciliaris, Beauv. Agros. (1812) p. 111, t. 11, fig. 6. Stems tall or short, tutted or branched from the base, or with long ereeping stems and ascending leafy branches, glabrous. Leaves $1-2\frac{7}{2}$ by 3-7 in., ovate to lanceolate, glabrous or laxly harry, the margins ciliate towards the base; sheaths with ciliate margins. Racemes few or many, on long naked or spathaceously sheathed glabrous peduncles, pale green or purplish. Spikelets $\frac{1}{5}$ - $\frac{1}{5}$ in. long, lanceolate or linearlanceolate; callus naked or shortly bearded. Glumes 4; lower invol.glume chartaceous, ovate-lanceolate (when spread out), acute, 7-10nerved, the nerves minutely aculeolate, often punctulate; upper invol.glume as long as the lower, linear, acute, 3-nerved; lower floral glume much shorter than the upper invol.-glume, ovate-oblong, acuminate, nerveless; upper floral glume about 1 as long as the upper invol.-glume, awned; awn subbasal, about twice as long as the spikelet. Fl. B. L. v. 7, p. 145; Trim. Fl. Ceyl. v. 5, p. 225; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 437; Prain, Beng. Pl. p. 1199.—Flowers: Oct.

S M. Countar Belgaum, Ritchie, 796 a! Gusanat: Chamargaou, Woodrow .-

Distain. Throughout India in hilly districts; Coylon.

A very variable species of which Hackel (Monog. Andropog. p. 354) recognizes no less than 12 forms. These, however, for the Indian species Sir Joseph Hooker has reduced to four. There is only one specimen from Bombay in Herb. Kew, obtained by Ritchie from Belgaum, and this has been included by Sir J. Hooker in his group Violaceus.

6. Arthraxon jubatus, Hack. Monog. Andropog. in DC. Monog. Phan. v. 6 (1889) p. 358. Annual; stems decumbent, then ascending, 4-12 in. long, very slender, tereto, quite glabrous, leafy almost to the apex. Leaves $\frac{7}{6} - \frac{1}{3}$ by $\frac{1}{6} - \frac{1}{3}$ m., lanceolate, acute, that, thinly membranous, green, undulate, densely pubescent or almost villous on both surfaces,

bise subcordate, amplexicaul; sheaths lax, pubescent, the upper spathiform, leatless; ligule very short, truncate, hyaline, glabrous. spathes 11-2 in, long, linear-lanceolate, acuminate, green, with membranous margins, pubescent or villous, enclosing the spikes. Racemes 2-nate, on a common pedancle, a subsessile and a pedicellate one; the pedicel slender, pubescent, fragilo; joints I as long as the spikelets and pedicels of upper spikelet clavate, compressed, pectinately ciliate. Spikelets 2-nate, a sessile and a pedicellate one at each joint, and a terminal male. Sessile spikelets if in, long, linear-lanceolate; callus In in. long, bearded with hairs equalling itself. Glumes 4; lower invol.-glume membranous, linear, acute, bimucronulate, 2-nerved, the margins hyaline, inflexed; upper invol-glume rather shorter than the lower, linear-lanceolate, mucronulate, much compressed, 1-nerved, with hyaline margins; lower floral glume & in. long, narrow, linear, subacute, hyaline, nerveless, glabrous; upper floral glumo \(\frac{1}{2}\) as long as the upper invol.-glume, lanceolate, acute, glabrous, with a very long capillary awn reaching 6 in, (or more) long, attached at the base; palea 0. Anthers 15 in. long. Pedicellate spikelets I in. long, not awned. Fl. B. I. v. 7, p. 147; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 437.—Flowers: Det.

Konny: Lavel, See Gt. Discove Wordrew, from seed sown in the Botanical Gurden of the College of Science, Poons, collected at Korr Fort, 12 miles S. of Lanoli, —Distana, India (W. Peninsula).

29. THELEPOGON, Roth.

A coarse perennial grass. Leaves lanceolate, cordate, amplexicaul. Racemes few or many, corymbosely fascicled, pedunculate; rhachis dexuous, fragile, the joints more or less deeply excavated. Spikelets ovoid, acute, solitary at the joints, the upper spikelet reduced to a mere almost glume-like rigid pedicel, the lower sessile, 2-flowered, the lower flower male, the upper 2-sexual. Glumes 4; lower invol.-glume coriaceous, transversely rugose, ridged or tuberculate; upper invol.-glume chartaceous, not keeled, sunk in the cavity of the joint, rigid, spiringly tulerculate; lower floral glume shorter, paleate, usually male, triandrons, with a similar palea; upper floral glume hyaline, 2-cleft, with a long twisted awn in the sinus, 3 nerved; palea narrow, equalling the glume. Lodicules cuncate, truncate. Stamens 3; anthers long. Styles free; stigmas short.—Distatis. Species 1, African and East Indian.

1. Thelepogon elegans, Roth, Nov. Pl. Sp. (1821) p. 62. An annual robust grass; roots stout, rigid; stems 1-3! ft. high, tufted and branching from the base, terete, erect or geniculately ascending, glabrous. Leaves 4-10 by ff fin., linear, acuminate, thin, cordate, amplexicanl, usually hispid with bulbous-based hairs or sometimes only tuberculately scabrid, the margins cartilaginously ciliate; sheaths loose, hispid above with bulbous-based hairs and with ciliate margins; ligule narrow, mombranous. Racemes 1-2 in. long, corymbose; pedaneles slender, stiff; joints of the rhachis as long as the spikelets, subclavate, scaberulous, the top orbicular, cupular. Spikelets [in. long, yellowish-white, ovate, beaked; callus small, annular, minutely bearded. Glumes 4; lower invol. glume thickly coriaceous, ovate, acuminate, with a membrances 2-dentate beak, the back convex with transverse much elevated

ridges, transluceut; upper invol.-glume slightly longer than the lower, broadly lanceolate, chartaceous, with a long acumen, the back flat or subcouvex, with 5-7 short transverse ridges; lower floral glume \(\frac{1}{2} \) in long, lanceolate, hyaline, 2-nerved, glabrous, the palea narrow, acute, nerveless; upper floral glume \(\frac{1}{2} \) in. long, ovate-lanceolate, hyaline, cleft to the middle, glabrous, 3-nerved, the lateral nerves running into the acute lanceolate lobes; awn inserted at the sinus, \(\frac{7}{2}-1 \) in. long, the column brown, twisted, equalling the yellow subulate portion; palea equalling the glume, oblong, acuminate. Pedicel of the obsolete upper spikelet longer than the sessile spikelet, linear, obtuse, curved, flat, ciliate ou one margin. Fl. B. I. v. 7, p. 148; Woodr, in Journ, Bomb, Nat. v. 13 (1901) p. 437.—Flowers; Sept.

KONKAY: Slocks!, Law! Deccan. Poona. Woodrew; Hewra, Dalzell!; near Nasik, Edgeworth! S. M. Country: Belgaum, Ritchie, S12!—Distrib. India (Central India, W Peninsula); Tropical Africa.

30. ELIONURUS, Humb. & Bonpl.

Aromatic exspitose grasses, usually perennial. Raceme solitary, subsimple, clothed with silky hairs; rhachis fragile, jointed, flattened. Spikelets 2-nate (one sessile, the other pedicellate). Sessile spikelets dorsally compressed, 1-flowered. Glumes 4; lower invol.-glume subcoriaceous, often 2-toothed or 2-fid, dorsally flattened, 2-keeled, usually with fine filiform transparent oil-glands close to the ciliate keels; upper invol.-glume membranous, lanceolate, neute, not awned; lower floral glume hyaline, empty, paleate or not; upper floral glume small, hyaline, awnless, paleate or not. Lodicules 2, cuneate. Stamens 3. Stigmas laterally exserted. Grain dorsally compressed, oblong.—Distrin. Species about 15, in the tropical and subtropical regions of both hemispheres.

1. Elionurus Royleanus, Nees, ex A. Rich. Tent. Fl. Abyss. v. 2 (1851) p. 471. Annual; stems 3-12 in. high, slender, leafy, geniculate; nodes pubescent. Leaves 13-4 by whin, linear-lanceolate, acute or acuminate, rigid, subcreet, at first green then together with the whole plant turning red, glabrous or sparsely hairy, fimbriate at the base: lower sheaths terete, much shorter than the internodes, the upper spathiform; ligale very short, membranous. Racemes 1-2 in. long, erect, yellowish-green or often variegated with purple, each enclosed in a long narrow flattened sheath; joints densely bearded at the apex with long white silky hairs, obliquely disarticulating, shorter than the sessile spikelets. spikelets nearly 1 in. long (including the beak); callus about 10 in. long, densely bearded. Glumes 4; lower invol.-glume coriaceous, nearly ; in. long (including beak), running out into a usually violetcolored, 2-fid beak about + in. long, the lobes ciliate, linear, slightly divergent, the margins of the glume below the beak with a row of large violet-colored tubercles each carrying a pencil of whitish glistening hairs; upper invol.-glume as long as the body of the lower, linear-lanceolate, acuminate, finely mucronate, membranous, 1-nerved; lower floral glume

a little shorter than the invol.-glumes, oblong, acute, nerveless, glabrous, epaleate; upper floral glume much shorter than the lower, oblong, obtuse, nerveless. Pedicellate spikelets: pedicels $\frac{1}{5}$ in. long, ciliate on one margin. Spikelets linear-subulate. Lower invol.-glume $\frac{3}{3}$ in. long, narrowed almost from the base into a long narrow linear ciliate beak; upper invol.-glume $\frac{1}{4}$ in. long, ovate-lanceolate, concave, membranous, narrowed into a short scabrid purplish awn. Fl. B. I. v. 7, p. 161; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 437.

GUJARAT: Rajkot (Kathiawar), Woodrow. Sind: Woodrow.—Distrib. India (Upper Gangetic plain, W. Peniusula); Arabia, Abyssinia, Cape de Verd Islands.

2. Elionurus hirsutus, Munro, ex Benth. in Journ. Linn. Soc. v. 19 (1881) p. 68. Perennial; rootstock woody, branched; stems 1-2 ft., ascending from a branching base, stout, smooth, rigid, more or less scabrid or pubescent; nodes pubescent. Leaves 3-6 by $\frac{1}{10-6}$ in., linear, finely acuminate: sheaths terete, glabrous or nearly so, the upper sheaths shorter than the internodes, glaucous or nearly white. Raceme solitary, stout, 2-4 in. long, silvery silky all over; joints shorter than the sessile spikelets, subclavate, densely villous on the back. Sessile spikelets at each node of the rhachis, solitary or 2-nate, imbricate. reaching \(\frac{3}{6} \) in. long or more (including the beak), pale green. Glumes 4; lower invol.-glume 3 in. long (including beak), coriaceous, 7-9-nerved, the beak often as long as the body of the glume, deeply 2-fid, densely silky-villous, the lobes divergent; upper invol.-glume 1 in. long, oyate, aristately acuminate, chartaceous, 3-5-nerved, the acumen ciliate at the tip; lower floral glume equalling the upper invol.-glume, hyaline, ovate-oblong, acute, 3-nerved, paleate, the palea lanceolate, acute, as long as the glume; upper floral glume shorter, ovate, acute, glabrous, with incurved margins. Pedicellate spikelets rather shorter than the sessile ones; pedicels about & in. long, shorter than the joints, flattened, subclavate, hairy on the back and with ciliate margins. Fl. B. I. v. 7, p. 162; Boiss. Fl. Orient. v. 5, p. 466; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 437; Watt, Dict. Econ. Prod. v. 3, p. 242. Rottboellia hirsuta, Vahl, Symb. part 1 (1790) p. 11; Hack. Monog. Andropog. in DC. Monog. Phan. v. 6 (1889) p. 311.

Dalzell without locality in Herb. Kew.! SIND: Stocks, 626!—DISTRIB. India (Panjáb, Rajputana, W. Peninsula); westwards to N. Africa.

31. ANDROPOGON, Linn.

Perennial or annual grasses of very varied habit. Leaves usually narrow. Spikelets similar or heteromorphous, 2-nate (one sessile, the other pedicellate), on the fragile rhachis of solitary, 2-nate, digitate fasciculate or paniculate racemes. Sessile spikelets 1-flowered; callus long or short. Glumes 3 or 4; lower invol.-glume coriaceous or chartaceous, 2-keeled, muticous; upper invol.-glume usually thinner with a median keel, rarely awned; lower floral glume hyaline or 0, neuter; upper floral glume hyaline, usually awned, often reduced to the dilated base of the awn, 2-sexual; palea various or 0. Lodicules 2, cuneate. Stamens 3-1. Stigmas laterally exserted. Grain various. Pediculate spikelets usually smaller than the sessile.—Distrib. Species more than 200, in the warm parts of the world.

Internodes of racemes deeply cupped at the apex.

Subgenus 1. Crmborogon. Racemes 2-nate, terminal on the stems. both together subtended by spathiform sheaths; spikelets differing in sex and form.

1. A. Iwarancusa. Roots aromatic

Subgenus 2. ARTHROLOPHIS. Racenies 2-nate (1 sessile, the other pedunculate), from spathiform sheaths; sessile spikelets alike in sex and form; joints opaque.

Internodes of racemes truncate but not cupped at the apex.

SECT. A. ISOZYGI. Sessile spikelets of all the pairs alike in sex and form.

Subgenus 3. Hypogynium. Raceme solitary, pedunculate, in the axil of a spathiform leaf-sheath; joints and pedicels obliquely truncate at the apex, opaque; pedicellate spikelets like the sessile.

Subgenus 4. AMPHILOPHIS. Racemes 2 or more, fasciculate or panienlate, all pedunculate; joints of the raceme many to few, like the pedicels, linear, compressed, with a translucent median channel and thickened margins (except A. concanensis).

Racemes with many pairs of spikelets.

Racemes digitate or fasciculate, not panicled, the lower longer than the rhachis of the inflorescence.

Lower invol.-glume of sessile spikelets villous below

the middle. Lower invol.-glume not pitted.

Upper invol.-glume mucronulate 4. A. compressus. 5, A. Woodrowii. Upper invol.-glume obtuse

6. A. pertusus.

low the middle (sparsely silky in A. cnsiformis). Nodes of stem densely bearded..... 7. A. Kuntzeanus.

Nodes of stem glabrous. 8. A. ensiformis.

9. A. concanensis.

Racemes panieled, the lower branches shorter than the rhachis of the inflorescence.

Racemes small, of 1-3 pairs of spikelets, often reduced to

3 spikelets, 1 sessile and 2 pediculate. Stems more or less suffrutescent below, stiff, erect.

Stems often proliferously branched; nodes of stom-glabrous; leaves reaching } in. broad; callus 12. A. assimilis,

bearded; leaves reaching & in. broad; callus

...... 13. A. Hugelii, densely villous Stems decumbent and interlaced, very weak, filiform . 14. A. filiculmis.

Subgenus 5. Sorghum. Racemes panicled, all pedunculate; rhachis

fragile; joints 1 or few, filiform, truncate, with ciliate margins; sessile, spikelets dorsally compressed.

Subgenus 6. Charsorogon. Raceme solitary, 1-jointed (i. e. reduced to 1 sessile, 2-sexual, and 2 pedicellate male or neuter spikelets), on the bearded tips of the branches of the panicle; sessile spikelets laterally compressed.

SECT. B. HETEROZYGI. Lowest one or more sessile spikelets in all racemes, or at least in one or two, differing from those above it in sex and form.

Subgenus 7. DICHANTHIUM. Racemes digitate (rarely solitary or paniculate); spikelets all alike in form, but differing in sex; lower 1-4 pairs of spikelets usually homogamous.

Subgenus 8. Heterorogon. Raceme solitary, terminal on the stems and branches; lower sessile spikelets very unlike the upper, which are cylindric.

1. Andronogon Iwarancusa, Jones, in Asiatic Research, v. 4 (1795) p. 109. Whole plant of a pale often glaucous green, perennial; stems up to 6 ft. high, tufted on an annulate creeping rootstock; roots aromatic. Leaves flat or convolute, 6 in. to 2 ft. by 10-3 in., linear with capillary tips, rigid or flexuous, glabrous or scaberulous, midrib slender: sheaths glabrous, the lower deciduous, splitting into flat often tortuous laminæ; ligule shortly oblong, membranous, ciliolate. Panicle very variable; branches distant or crowded, simple or branched; proper spathes 1-2 in. long, longer than the peduncles of the racemes, narrowly lanceolate; racemes } - f in. long, unequal; joints of rhachis and pedicels of upper spikelets subclavate, densely villous with long hairs, the hairs more or less concealing the sessile spikelet, the tops cupular, toothed: spikelets 3 or 4 pairs. Sessile spikelets reaching 4 in. long, linearlanceolate, acute; callus acute, densely bearded with long whitish hairs. Glumes 4; lower invol.-glume 1 in. long, linear-lanceolate, thin, flat, glabrous, nerveless, keels scaberulous; upper invol.-glume } in. long, ovate, acute, cymbiform, thinly membranous, 3-nerved; lower floral glume & in. long, linear-oblong, obtuse, hyaline, 2-nerved; upper floral. glume \(\frac{1}{10}\) in, long, 2-fid, hyaline, ciliate; awn from the sinus \(\frac{1}{3}\) in, long, slender, glabrous. Pedicellate spikelets searcely longer than the sessile, narrowly lanceolate, purplish; pedicels 10 in. long; lower invol.-glume 7-9-nerved, glabrous, with scaberulous keels; upper invol.-glume ovateoblong, obtuse, 3-nerved, ciliate; lower floral glume oblong, obtuse, hyaline, ciliate. Fl. B. I. v. 7, p. 203; Grah. Cat. p. 238; Dalz. & Gibs. p. 301; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beug, Pl. p. 1200. Andropogon laniger, Watt, Diet. Econ. Prod. v. 1, p. 244 (partly).—Flowers: Dec.

GUJARAT: Ahmedabad, Dalzell of Gibson. Sind: Karachi, Dalzell of Gibson, Woodrow.

Van. laniger, Hook. f. Fl. B. I. v. 7 (1896) p. 203. Stem short, subsimple; leaves junciform; lower sheaths hardened, persistent; panicle narrow, subsimple. Andropogon laniger, Desf. Fl. Atlant. v. 2 (1800) p. 379.—Flowers: July-Dec.

Sind: widely, Woodrow, Stocks, 816!; Jemadar ka Landa near Karachi, Stocks!

2. Andropogon pumilus, Roxb. Fl. Ind. v. 1 (1832) p. 273. Annual; stem 6-18 in. high, slender, subcreet or geniculate and decumbent below, quite glabrous; nodes glabrous. Leaves 3-5 by 10-1 in., linear, finely acuminate, glabrous; sheaths compressed, keeled, quite glabrous; ligule short, truncate, membranous, glabrous. Racemes 2-1 in. long, in nearly equal pairs on a very slender pedancle which arises from a narrow flattened glabrous spathe $\frac{1}{4}$ - $\frac{1}{4}$ in, long; joints $\frac{1}{10}$ in, long, very slightly clavate (almost linear), flattened, glabrovs and often red on the back, with densely ciliate margins and a cup-shaped 2-3-toothed apex. Sessile spikelets reaching & in. long; callus glabrous. Glumes 4; lower invol.-glume 1 in. long, linear-lanceolate, acuminate, membranous, 2-cuspidate, the keels strong, running into the slender awas about 30 in. long; upper invol.-glume as long as the lower, narrowly lanceolate, mucronate, coriaceous, 1-nerved; lower floral glume hardly in. long, linear-lanceolate, subacute, hyaline; upper floral glume 10 in. long, narrowly linear, hyaline, cleft at the apex into 2 subulate lobes with an awn in the sinus between them; awn reaching § in. long,

geniculate about the middle; the lower half brown, the upper white. Anthers $\frac{1}{12}$ in. long. Pedicellate spikelets not awned; pedicels $\frac{1}{8}$ in. long with ciliate margins. Glumes 3; lower invol.-glume $\frac{1}{8}$ in. long, ovate-lanceolate, acuminate, 5-nerved. Fl. B. I. v. 7, p. 170; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438. Andropogon pachyarthrus, Hack. Monogr. Andropog. in DC. Monogr. Phan. v. 6 (1889) p. 449.—Flowers: Dec. Vern. Baerki; Gondval.

There is an excellent drawing of this grass in Icones Rowburghiance in

Herb. Kew. No. 2020.

DECCAN: Khandesh, Lisboa. KANARA: Karwar, Lisboa. Gujarat: Surat, Dalzell!, Woodrow.—Distrib. India (Nepal, Rajputana, Central Provinces, W. Peninsula).

3. Andropogon foveolatus, Del. Descrip. de l'Egypte (1812) p. 160, t. 8, fig. 2. Stems 1-2 ft. long, densely tufted, usually decumbent at the base, then geniculately ascending, very slender, glabrous; nodes bearded. Leaves 3-6 by 10-10 in., linear, scaberulous beneath; sheaths shorter than the internodes, scabrous or glabrous, the basal sheaths silky-villous; ligule short, truncate, hyaline, ciliate. Racemes 1-11 in. long, solitary; peduncles capillary, erect, usually far exserted beyond the slender spathe; joints and pedicels slender ciliate on 2 opposite sides with long silky hairs, shorter than the sessile spikelets. Spikelets 1 in. long (the sessile and pedicellate equal), oblong-lanceolate, glabrous, purplish; callus small, shortly hairy at the base; lower invol.-glume in. long, flat, lanceolate-oblong, subobtuse, with narrowly involute margins, 4-nerved, usually marked with a deep pit above the middle; upper invol.-glume equal to the lower, lanceolate, acute, obscurely 3-nerved; lower floral glume much shorter, oblong-lanceolate, glabrous, nerveless; upper floral glume reduced to an awn $\frac{1}{2}$ - $\frac{5}{8}$ in long, the column about equalling the subulate portion. Anthers 10 in. long. Pedicellate spikelets: pedicels 10 in. long. Glumes 2; lower invol.-glume 1 in. long, lanceolate, acute, with slightly incurved margins, the keels above aculeately scabrid, 5-nerved, pitted or not; upper invol.-glume equalling the lower, linear-lanceolate, acute, 3-nerved. Fl. B. I. v. 7, p. 168; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng. Pl. p. 1201.-Flowers: Oct. VERN. Ghandel.

DECCAN: Poona, Cooke!, Woodrow, Jacquemont, 454!; Khandesh, Lisboa.—Distrib. Throughout the drier parts of India; westwards to the Cape Verd Islands.

4. Andropogon compressus, Hook. f. Fl. B. I. v. 7 (1896) p. 172. A tall grass reaching 3-4 ft. high; stem as thick as a goosequill at the base, erect, sparingly branched, leafy; nodes glabrous. Leaves 12-18 by $\frac{1}{4} - \frac{3}{8}$ in., linear, finely acuminate, flat, slightly scaberulous on both surfaces and on the margins, more or less hairy towards the base; sheaths strongly compressed and acutely keeled; ligule a glabrous membrane $\frac{1}{10}$ in. long. Panicles 4-5 in. long, of many subcorymbosely arranged pale flexuous silky racemes 1-2 in. long; joint $\frac{1}{10}$ in. long, slender, with a central translucent line, ciliate on 2 opposite sides with long silky hairs. Sessile spikelets $\frac{1}{6}$ in. long, ovatelanceolate; callus bearded with long hairs; lower invol.-glume ovatelanceolate, $\frac{1}{5}$ in. long, villous on the back below the middle, truncate or notched at the apex, with narrowly incurved margins and a hyaline tip, 5-7-nerved, not pitted; upper invol.-glume ovate, acute, mucronulate, vol. II.

DECCAN: Lishoa, 6 (A. odoratus)!; Mawal, Woodrow!; Poona, Woodrow.-Distrib. India, W. Peninsula, apparently endemic.

5. Andropogon Woodrowii, *Hook. f. Fl. B. I.* v. 7 (1896) p. 173 (by misprint Woodrovii). A grass with a camphoraceous odor (Woodrow); rootstock woody; stems tufted, 3-4 ft. long, erect, compressed, thicker than a goose-quill at the base, obtasely 2-edged, solid, stiff, branched above; nodes glabrous. Leaves 12-24 by $\frac{1}{6}$ in., rigid, scaberulous on both surfaces and the margins; sheaths loose, keeled, quite smooth; ligule in. long, membranous, truncate, ciliate. Racemes 3-5, pale, 1-1 in. long, on slender, stiff, smooth proper peduncles 1-1 in. long, erect, silky; joints of the rhachis and the pedicels linear, with silky margins and a translucent centre, the hairs at the top 1 as long as the spikelet. Sessile spikelets in long, oblong-lanceolate; callus in long, bearded; lower invol.-glume coriaceous, not pitted, ovate-oblong, truncate and hyalme-tipped at the apex, many-nerved, margins narrowly incurved, keels ciliolate; upper invol.-glume chartaceous, 3-nerved, oblong, subobtuse, as long as the lower; lower floral glume 1/8 in. long, ovate-oblong, obtuse, hyaline, nerveless; upper floral glume reduced to an awn 3 in, long with a hyaline flattened base 1 in, long. Pedicellate spikelets rather narrower than the sessile; lower invol.-glume glabrous on the back; upper invol.-glume narrow, linear, acute; awn 0. Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438.—Flowers: Dec.

DECAN: Khorbasa (Mawal districts), Woodrow; Paud, 20 miles west of Poona. Woodrow!- Distain. India (W. Peninsula), apparently endemic.

6. Andropogon pertusus, Willd. Sp. Pl. v. 4 (1805) p. 922. Stem 1-2 ft. long, erect or geniculately ascending, leafy upwards, simple or sparingly branched; nodes bearded with spreading hairs. Leaves up to 1 ft. by $\frac{1}{8} - \frac{1}{6}$ in., harrowly linear, acute or acuminate, the lower often short and crowded at the base of the stem, glabrous or pubescent, or sometimes sparingly pilose, margins scabrid, base narrow, rounded sheaths terete or slightly compressed, shorter than the internodes ligule 10 in. long, membranous, truncate, ciliate. Racemes 3-8 digitately fasciculate, 1-2 in, long, slender, silky, subcreet, flexuous, or short usually glabrous peduncles which are often bearded in the axils rhachis very slender; joints and pedicels 70 in. long, densely ciliate with long silky hairs, the central translucent band very narrow Sessile spikelets in in. long, oblong-lanceolate, acuminate by the pro jection of the point of the upper invol.-glume; callus bearded; lowe invol.-glume elliptic-oblong, obtuse or truncate, sometimes slightly emarginate, with a deep pit above the middle (sometimes 2 pits when one is above, the other at or about the middle), subchartaceous, more o less hairy below the middle, 5-9-nerved, margins narrowly incurved spinulosely ciliate; upper invol.-glume lanceolate, acuminate, finely pointed at the tip, the point slightly projecting beyond the lower glume, 3-5-nerved, membranous, glabrous; lower floral glume $\frac{1}{10}$ in. long, linear-oblong, obtuse, nerveless, glabrous; upper floral glume reduced to a slender awn reaching nearly $\frac{3}{4}$ in. long, geniculate about the middle, the lower half brown, the upper yellowish-white, with a narrow linear hyaline flattened base $\frac{1}{12}$ in. long which represents the glume; palea 0. Pedicellate spikelets like the sessile but narrower, not awned; lower invol.-glume acute, very rarely pitted, 7-13-nerved, ciliate; upper invol.-glume ovate-lanceolate, acute, 5-nerved, with incurved margins; lower floral glume linear-oblong, obtuse, hyaline, glabrous. Fl. B. I. v. 7, p. 173; Trim. Fl. Ceyl. v. 5, p. 230; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng. Pl. p. 1201; Watt, Dict. Econ. Prod. v. 1, p. 249.—Flowers: Sept. Lisboa (Journ. Bomb. Nat. v. 6 (1901) p. 202) says that the inflorescence of the grass is scented.

Deccan: Poona, Cooke!; Lanoli, Woodrow; Sattara, Lisboa; Sholapur, Lisboa.

Kanara: Lisboa.—Distrib. More or less throughout India in the drier parts; Ceylon,

Tropical Asia, Africa and Australia, Sicily.

7. Andropogon Kuntzeanus, Hack. Monog. Andropog. in DC. Monog. Phan. v. 6 (1889) p. 478. A tall grass 3-5 ft. high; stems ascending, as thick as a goose-quill below, with 2-3 slender flowering branches above, terete, small; nodes densely bearded. Leaves narrowly linear, 12 by $\frac{1}{8}$ in., glabrous, glaucous, smooth, with scaberulous margins, the upper cauline leaves short, rigid. Racemes 12-15, corymbosely fasciculate, slender, silky, purplish; proper peduncles $\frac{1}{4}-\frac{1}{3}$ in. long, slender, glabrous; joints and pedicels $\frac{1}{10}$ in. long, with a translucent centre, slender, densely ciliate with very long erect hairs. Sessile spikelets \(\frac{1}{5}\) in. long, linear-lanceolate; callus sparsely bearded at the base with very long hairs; lower invol.-glume ovate-lanceolate, thin, glabrous, usually pitted, 7-9-nerved, 2-toothed at the apex, the teeth about $\frac{1}{20}$ in, long; upper invol.-glume as long as the lower, lanceolate, acuminate, mucronate, ciliate; lower floral glume 1 in. long, linear-lanceolate, glabrous, hyaline; awn $\frac{5}{8}$ in. long, the basal slightly flattened portion 10 in. long. Pedicellate spikelets narrower than the sessile, male; lower invol.-glume 9-11-nerved, tip entire; upper invol.glume 5-nerved, conspicuously ciliate; lower floral glume linear-oblong, hyaline, ciliate; upper floral glume small, narrowly linear or 0. II. B. I. v. 7, p. 175; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438.— Flowers: Oct.

KONKAN: Stocks! Deccan: Woodrow, 153!; Máwal, Woodrow,—Distrib. India (Central Provinces, W. Peninsula).

8. Andropogon ensiformis, Hook. f. Fl. B. I. v. 7 (1896) p. 175. Stems 2 ft. and upwards, densely tufted, stout, compressed, clothed with equitant leaf-sheaths; nodes glabrous. Leaves 8-10 by $\frac{1}{3}-\frac{1}{6}$ in., erect, strict, rigid, linear-lanceolate, acuminate, strongly nerved, glabrous or sparsely hairy, tips acicular, margins and both surfaces scaberulous; sheaths smooth, compressed, the lower equitant; ligule short, scarious. Racemes $\frac{1}{2}-\frac{2}{3}$ in. long, in an erect narrow thyrsus 3 in. long, pale purplish; proper peduncles $\frac{1}{6}-\frac{1}{4}$ in. long; joints and pedicels $\frac{1}{10}$ in. long, very slender, flat, with a translucent channel, ciliate with long

erect hairs. Sessile spikelets \(\frac{1}{3} \) in. long, oblong-lanceolate, acute; callus small, densely bearded with hairs nearly \(\frac{1}{2} \) as long as the spikelet; lower invol.-glume \(\frac{1}{3} \) in. long, ovate-oblong, flat, truncate, often emarginate, shining, 5-7-nerved, not pitted, very sparsely silky-hairy below the middle, margins very narrowly incurved, keels slender; upper invol.-glume reaching \(\frac{1}{3} \) in. long, ovate-oblong, acute, finely mucronate, slightly exceeding the lower, 3-nerved; lower floral glume less than \(\frac{1}{3} \) in. long, linear-oblong, acute, hyaline; upper floral glume reduced to an awn reaching \(\frac{7}{3} \) in. long, the flattened slightly dilated base \(\frac{1}{1} \) in. long representing the glume. Pedicellate spikelets as long as the sessile, oblong-lanceolate; lower invol.-glume many-nerved; upper invol.-glume 5-nerved; lower floral glume as long as the sessile; upper floral glume 0. Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438.—Flowers: Sept.

Datzell without locality in Herb. Kew.! Deccan: Lanoli, Woodrow.—Distrib. India (W. Peniusula), apparently ondomic.

9. Andropogon concanensis, Hook. f. Fl. B. I. v. 7 (1896) p. 174. Perennial; stems many from a nodose rootstock, 20-24 in. high, firm, smooth, terete, leafy; nodes glabrous. Leaves 8-10 by 10-1 in., linear, finely acuminate, smooth on both surfaces; sheaths smooth, terete; ligule short, membranous, truncate, glabrous. Racemes 5-8, loosely fasciculate, 2-27 in. long, slender, flexuous, pale; rhachis and proper peduncles filiform, glabrous, the latter 1-4 in. long, with slightly bearded axils; joints and pedicels 13 in. long, compressed, hardly grooved and not translucent in the centre, the sides not thickened, ciliate with long silky hairs. Sessile spikelets less than & in. long, ovatelanceolate, narrowly truncate; callus bearded; lower invol.-glume membranous, with incurved margins, glabrous, not pitted on the back, keels ciliate with short bristles, 7-9-nerved; upper invol.-glume as long as the lower, lanceolate, acuminate, ending in a fine point which just appears above the tip of the lower glume, faintly 3-nerved; lower floral glume much shorter than the others, oblong, obtuse, nerveless; upper floral glume a capillary yellowish awn reaching in. long with a slightly dilated base to in. long. Pedicellate spikelets narrower than the sessile; lower invol.-glume 9-nerved; upper invol.- and lower floral glume as in the sessile spikelets; upper floral glume small, oblong, often unequally 2-fid, ciliate, nerveless. Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 438.—Flowers: Oct.

Konkan: Matheran, Woodrow!

10. Andropogon intermedius, Br. Prodr. (1810) p. 202. Perennial; stem 2-4 ft. high or more, stout, erect or geniculately ascending, slightly flattened on one side, simple or sparingly branched, heafy upwards; nodes usually hairy. Leaves 6-18 by \(\frac{1}{8} - \frac{1}{9}\) in., narrowly linear, glaucous, finely acuminate with capillary tip, subcoriaceous, glabrous or ciliate towards the base; sheaths terete, glabrous; ligule a narrow truncate membrane \(\frac{1}{9}\) in. long, ciliate or not. Panicle 3-6 in. long, erect, pyramidal, thyrsitorm or subcorymbose; rhachis glabrous; branches \(\frac{1}{2} - 1\frac{1}{2}\) in. long; racemes slender, fragile, pale-green or purplish, with a capillary rhachis; joints of the rhachis shorter than the spikelets with a translucent centre, ciliate. Scssile spikelets \(\frac{1}{16} - \frac{1}{3}\) in.

long; callus very short, bearded; lower invol.-glume thin, oblong, obtuse or truncate, 4-9-nerved, margins narrowly incurved, rigidly ciliate above the middle, not pitted; upper invol.-glume as long as the lower, oblong-lanceolate, acute, faintly 3-nerved, smooth; lower floral glume much shorter, oblong, obtuse, nerveless; upper floral glume represented by the hyaline slightly flattened base of the awn; palea 0; awn reaching $\frac{5}{8}$ in. long. Pedicellate spikelets linear-oblong or lanceolate, narrower than the sessile; pedicel $\frac{1}{10}$ in. long with a translucent centre, usually ciliate. Fl. B. I. v. 7, p. 175; Trim. Fl. Ceyl. v. 5, p. 230; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng. Pl. p. 1201.—Flowers: Dec.

Deccan: Poona, Woodrow; Mawal, Woodrow.—Distrib. More or less throughout India; Ceylon, China, Malaya, Pacific Islands, Africa.

11. Andropogon odoratus, Dna. Lisboa, in Journ. Bomb. Nat. v. 4 (1889) p. 123. Aromatic; stem erect, 3-4 ft. high, as thick as a swan's quill at the base, sometimes branching below, leafy; nodes bearded. Leaves 12-24 by $\frac{1}{6} - \frac{3}{8}$ in., linear-lanceolate, flat, acuminate. scaberulous on both surfaces and on the margins, bright green, with strong nerves; sheath's long, glabrous, smooth, compressed, the upper sheathing the base of the inflorescence; ligule small, membranous. truncate. Racemes numerous, purplish, silky, suberect, slender, flexuous, densely fascicled, pedicellate, crowded at the end of a long peduncle and forming a dense panicle 2-4 in. long; joints and pedicels flattened, with a translucent centre, silky-hairy, the joints 1 in. long, the pedicels Sessile spikelets purplish, \(\frac{1}{6}\) in. long, oblong-lanceolate. rather longer. acute; callus small, bearded with silky hairs; lower invol.-glume thin, oblong-lanceolate, truncate, 7-nerved, softly hairy below the middle, rarely pitted; upper invol.-glume very little longer than the lower and broader, thinly membranous, keeled; lower floral glume hyaline, oblonglanceolate, shorter than the upper invol.-glume, nerveless; awn $\frac{1}{2} - \frac{5}{8}$ in. long, slightly dilated towards the base. Pedicellate spikelets as long as or slightly longer than the sessile; lower invol.-glume narrow, manynerved, dorsally glabrous; upper invol.-glume 3-nerved, ciliate; lower floral glume shorter, oblong, obtuse, nerveless. The compressed sheaths. panicled racemes, villous lower invol.-glume of the sessile spikelets, and aroma seem to distinguish this from Andropogon Kuntzeanus, which it strongly resembles in a dry state (Hooker). Fl. B. I. v. 7, p. 177; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 438.—Flowers: Oct. VERN. Gavat-vedi.

Konkan: Khardi (Thána districts), Mrs. Lisboa. Deccan: Lanoli, Mrs. Lisboa; Máwal (Ponna districts), Woodrow; Khandesh, Lisboa.—Distrib. India (W. Peninsula), apparently endemic.

12. Andropogon assimilis, Steud. in Zoll. Syst. Verz. (1854) p 58; Syn. Gram. (1855) p. 397. Suffratiose, fastigiately branched from a decumbent base; stems 1-2 ft. long, hard, smooth and polished, as thick as a goose-quill at the base, often proliferously branched; nodes glabrous or rarely bearded. Leaves 3-8 by $\frac{1}{10}$ - $\frac{1}{4}$ in., linear-lanceolate, finely acuminate, glabrous or nearly so, with a strong white midnerve; sheaths usually glabrous, except at the mouth which is sometimes bearded, the upper sheaths appressed, the lower open, often divaricate;

ligule short, membranous, ciliate. Inflorescence in lax panicles: branches slender, almost capillary, with long hairs in the axils. Spikelets few, rather distant, pale-green; joints 10 in. long, with a translucent Sessile spikelets to in. long, ovoid-oblong; centre, sparsely ciliate. callus small, shortly bearded; lower invol.-glume 10 in. long, ovateoblong, shortly truncate, obscurely 4-6-nerved, ciliate chiefly in the upper half, not pitted; upper invol.-glume as long as the lower, lanceolate, acute; lower floral glume shorter, linear, obtuse; upper floral glume reduced to the scarcely flattened base of the awn; awn 3-1 in. long, the lower half brown, the upper yellowish-white. Pedicellate spikelets & in. long, not awned; pedicels 16 in. long, sparsely ciliate; lower invol.-glume lanceolate, acute, the margins incurved and the keels ciliate in the upper part, 5-7-nerved; upper invol.-glume slightly shorter, lanceolate, 3-nerved; lower floral glume obovate-oblong, ciliate at the apex, hyaline; upper floral glume 0. Anthers L in. long. Fl. B. I. v. 7, p. 179; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng, Pl. p. 1201. Andropogon. montanus, Benth. Fl. Hongk. (1861) p. 423 (not of Roxb.); Hack. Monog. Androp. in DC. Monog. Phan. v. 6 (1889) p. 490; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438.—Flowers: Dec.

13. Andropogon Hugelii, Hack. Monog. Androp. in DC. Monog. Phan. v. 6 (1889) p. 492. Stem often suffrutescent below, frequently red, branching from the base, the branches 21-31 ft. long; nodes bearded. Leaves 4-8 by 3-1 in., linear-lanceolate, acuminate, flat, flaccid, green, narrowed to the base, the margins scaberulous or sometimes citate; sheaths bearded at the mouth, otherwise glabrous; ligulo membranous, ciliate. Paniele 2-3; in. long; branches capillary with bearded axils; joints and pedicels ciliate. Sessile spikelets in in. long, pale-green or purplish; callus densely villous; lower invol.-glume chartaceous, ovate, truncate, villous below the middle or glabrous, margins narrowly incurved, the keels ciliate with long hairs; upper invol.-glume as long as the lower, glabrous, narrowly truncate, shortly apiculate; lower floral glume 116 in. long, hyaline, ovate, obtuse, glabrous; upper floral glume represented by the slender white not dilated base of the awn; awn reaching nearly 1 in. long. Pedicellate spikelets 1 in. long, lanceolate, green or purple; lower invol.-glume subscute, 9-11-nerved, pubescent up the back and with ciliate keels; upper invol.-glume as long as the lower, acuminate, the keels minutely ciliate; lower floral glume oblong, obtuse, hyaline, nearly as long as the upper invol.-glume, nerveless; upper floral glume narrowly linear or 0. Fl. B. I. v. 7, p. 180; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438.—Flowers: Sept.

Driccan: Pocna, Woodrow. S. M. Country: Belgaum, Woodrow.—Distrib. India (Central Provinces, Central India, W. Peninsula).

14. Andropogon filiculmis, Hook. f. Fl. B. I. v. 7 (1896) p. 181. Stems 2-3 ft. long, decumbent and interlaced, copiously geniculately branched, weak, filiform, quite glabrous; internodes long; nodes

Leaves 2-4 by $\frac{1}{3}$ in., linear-lanceolate, finely acuminate with a filiform tip, glabrous above, glabrous or sparsely hairy beneath, flaccid, suddenly narrowed at the base, pale green, the midrib and nerves slender; sheaths bearded at the very tip, otherwise glabrous, the lower sheaths open below; ligule membranous, ciliate. Panicles 1-2 in. long.; branches few, filiform. Spikelets 2 or 3, pale-green or white; pedicels of upper spikelets ciliate with long hairs. Sessile spikelets 1 in. long, oblong-lanceolate; callus densely villous; lower invol.-glume oblonglanceolate, obtuse, membranous, 5-7-nerved, villous below the middle or all over, the keels ciliate; upper invol.-glume thinly membranous, lanceolate, acute, shortly mucronate, 3-nerved, glabrous; lower floral glume small, ovate, obtuse, nerveless, hyaline; upper floral glume represented by an awn $\frac{1}{2}-\frac{5}{5}$ in. long, the lower half dark brown, the upper half yellowish-white, the base not dilated, white for about 15 in-Pedicellate spikelets as long as the sessile but narrower; lower invol.glume ovate-lanceolate, acute, 7-9-nerved, ciliate; upper invol.-glume lanceolate, strongly 5-nerved; lower floral glume broadly oblong, obtuse. hyaline, nerveless, as long as the invol-glumes; upper floral glume 0. Woodr, in Journ, Bomb. Nat. v. 13 (1901) p. 438.—Flowers: Nov.-Dec. DECEAY: Poona, Jacquemont, 3101; Dhonshi (Mawal districts), Woodrow, 261 and

Deccay: Poona, Jacquemont, 3101; Dhonshi (Mawal districts), Woodrow, 261 and 1161 Kanara: Sirsi, Woodrow.—Distrib. India (W. Peninsula), apparently endemic.

15. Andropogon halepensis, Brot. Fl. Lusit. v. 1 (1804) p. 89. Perennial; stems erect, tall, up to 15 ft. high, stout, simple or sparingly branched, glabrous, leafy; nodes minutely silky. Leaves 1-2 ft. by 4-2 in., linear-lanceolate, tapering to a fine point, glabrous, smooth, margins scabridly serrulate, midrib stout, base narrowed or sometimes rounded; sheaths glabrous, striate; ligule short, membranous, ciliate. Panicle 6-18 in. long, decompound; rhachis nearly smooth; branches mostly alternate, subcreet, filiform, the lower branches up to 8 in. long or more, the axils often bearded; racemes 1-1 in. long, oblong; joints 3-7, more than 4 as long as the sessile spikelets, more or less ciliate: pedicels similar. Sessile spikelets \(\frac{1}{6} - \frac{1}{6}\) in, long, ovoid-lanceolate, dorsally compressed, green or purplish; callus small, shortly bearded. Glumes 4; lower invol.-glume subchartaceous, ovate, acute, convex, more or less silky-hairy, 5-13-nerved, with involute margins; upper invol.-glume as long as the lower, lanceolate, acuminate, chartaceous, shining, 5-7nerved; lower floral glume almost as long as the upper invol.-glume, elliptic-oblong, obtuse, hyaline, ciliate; upper floral glume 45 in. long, oblong, 2-lobed, hyaline, ciliate; awn 1 in. long, sometimes reduced to a bristle or suppressed. Pedicellate spikelets about as long as the sessile but much narrower, not awned, male or barren; lower invol.-glume herbaceous, 5-9-nerved, glabrous, the keels ciliate; upper invol.-glume similar, 3-5-nerved; lower floral glume as in the sessile spikelets; upper floral glume linear-oblong, hyaline. Fl. B. I. v. 7, p. 182; Trim. Fl. Ceyl. v. 5, p. 231; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng. Pl. p. 1201. Sorghum halopense, Pers. Syn. v. 1 (1805) p. 101; Watt, Diet. Econ. Prod. v. 6, part 3, p. 280.—Flowers: Dec. VERN. Boru.

Konran: Woodrow; Bassein, Lisboa. Dicean: Lisboa; Poona, Woodrow; Dangs, Woodrow. Guarat: Lisbou.—Distrin. Throughout India; Coylon, most warm countries.

16. Andropogon purpureo-sericeus, Hochst. ew A. Rich. Tent. Fl. Abyss. v. 2 (1851) p. 469. Annual, robust; stem 3-4 ft. high. erect, stout or slender, smooth and polished, glabrous; nodes villous. Leaves 8-10 by 1-1 in., linear, finely acuminate, sparingly appressedly hairy on both sides, the margins scabrous; sheaths subcompressed, glubrous except the villous mouth; ligule very short, ciliate. Panicle 4-8 in. long, erect; rhachis glabrous; branches filiform, subflexuous, 3-1 in. long, often bulbously swollen at their articulation with the Thachis; racemes 1-1! in. long, rarely of 3 joints, sometimes of 1 sessile and 2 pedicellate spikelets; joints about 1 as long as the sessile spikelets. Sessile spikelets reaching & in. long, densely villous with red or white hairs; callus small, densely villous. Glumes 4; lower invol.glume ovate, acuminate, concave, coriaceous or cartilaginous, 7-nerved, with the margins involute from the base to the tip, clothed with long red or white hairs; upper invol.-glume as long as or rather longer than the lower, oblong-lanceolate, coriaccous, concave, acuminate or aristulate, 5-nerved, the back clothed in the upper part with long hairs, the margins narrowly infolded; lower floral glume as long, membranous, densely ciliate, oblong-lanceolate, glabrous on the back; upper floral glume very fragile, To in. long, hyaline, 2-lobed, ciliate; awn reaching 13 in. long, the column dark brown, twisted, and ciliate with short erect hairs. Pedicellate spikelets equalling the sessile but paler and narrower; lower invol.-glume linear-lanceolate, acute, 5-9-nerved, shortly silky; upper invol.- and lower floral glumes as in the sessile spikelets; upper floral glume a little shorter, lanceolate, acuminate, hyaline, ciliate. Fl. B. I. v. 7, p. 185; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438.— Flowers: Nov.

Diccan: Woodrow, 129!; Lishaz; Kolhapur, Woodrow, S. M. Country: Belgaum, Ritchte, 887! Kanara; N. Kanara, Woodrow, 40!—Distrib. India (Central Provinces, W. Pennsula); Abyssinia.

17. Andropogon aciculatus, Retz. Obs. fasc. 5 (1789) p. 22. Rootstock woody, creeping; stems erect or ascending, 1-2 ft. long, slender, leafy chiefly at the base; lower internodes very short, the upper elongate; nodes glabrous. Leaves densely tufted, 1-5 by $\frac{1}{8}$ - $\frac{1}{5}$ in., linear, obtuse or subacute, flat or with undulate margins, glaucous, usually glabrous, the margins more or less distantly spinulose; sheaths not auricled, the lower short, the upper clongate with a more or less hairy mouth; ligule a very short membrane. Panicles 1-3 in long, narrowly oblong, pale green or purplish; rhachis strict, filiform; branches short, spreading, at length erect, capillary, bearing few spikelets. spiketets in long, dorsally compressed; callus elongate, decurrent on the peduncle and with it laterally fulvously bearded. Glumes 4; lower invol.-glume chartaceous, narrowed from a broad base to the usually bimucronulate tip, dorsally convex, glabrous on the back, the keels ciliate with short stiff erect hairs, obscurely 2-3-nerved; upper invol.-glume as long, lanceolate, acuminate or aristulate, 1-nerved, the keel setosely ciliate; lower floral glume shorter, linear-oblong, obtuse, 2-nerved; upper floral glume narrow, hyaline, ciliate; awn terminal, about & in. long, nottwisted. Pedicellate spikelets reaching 1 in. long, lanceolate, cuspidately . acuminate, purplish; pedicels nearly as long as the sessile spikelets, flattened, glabrous except for a small tuft of hairs at the base; lower

invol.-glume thin, lanceolate, acuminate, 3-nerved; upper invol.-glume a little shorter, acuminate, 3-nerved, ciliate; lower floral glume hyaline, oblong, acuminate, shorter than the invol.-glumes, nerveless; upper floral glume smaller, broader, 3-nerved, ciliate. Anthers 1/5 in. long. Fl. B. I. v. 7, p. 188; Grah. Cat. p. 238; Dalz. & Gibs. p. 303; Trim. Fl. Ceyl. v. 5, p. 234; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng. Pl. p. 1202; Watt, Dict. Econ. Prod. v. 1, p. 242.—Flowers: Oct.

KANARA: Karwar, Woodrow. - Distrib. More or less throughout India; Ceylon, Australia, Polynesia, Tropical Asia.

- 18. Andropogon lancearius, *Hook. f. Fl. B. I.* v. 7 (1896) p. 190. Stem 2-3 ft. high or more, leafy upwards; nodes glabrous. Leaves 12-14 by 1-1 in., lanceolate, acuminate, narrowed from below the middle to the base, smooth on both surfaces, flat, midrib broad, white above, margins minutely spinulose; sheaths keeled, quite glabrous; ligule a row of fine short hairs. Panicle 6 in. long, narrow, of many whorls of simple smooth erect branches bearing solitary erect racemes. Sessile . spikelets 1 in. long; callus about 1 in. long, glabrous in front. Glumes 4; lower invol.-glume nearly 1 in. long, oblong, chartaceous, truncate or notched, obscurely 5-nerved; upper invol.-glume 1 in. long, oblong, chartaceous, shortly ciliate on the keels, otherwise glabrous, cleft at the apex into 2 acute lobes; lower floral glume & in. long, linear-oblong, obtuse, hyaline; upper floral glume $\frac{1}{10}$ in. long, linear, hyaline; awn $1\frac{5}{5}$ in. long, the column much twisted and densely hairy with reddish-brown hairs. Pedicellate spikelets nearly \(\frac{1}{3} \) in. long (not including the awn), lanceolate, acute, awned; pedicels nearly white, in long, flattened, ciliate with long reddish-brown hairs. Lower invol.-glume lanceolate, acute, 2-toothed at the tip, with an awn about $\frac{1}{10}$ in. long between the acicular teeth, 7-nerved, membranous, glabrous; upper invol.-glume as long as the lower, lanceolate, acuminate, membranous, 5-nerved; lower floral glume shorter, linear-oblong, obtuse, ciliate, hyaline; upper floral glume hyaline. Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng. Pl. p. 1202.—Flowers: Oct.
- S. M. COUNTRY: Castlerock, Woodrow,—Distrib. India (Sikkim Himalaya, Behar, Chota Nagpur, W. Peninsula).

This is included on the authority of Woodrow. I have seen no specimens from the Bombay Presidency; there are none in Herb. Kow.

19. Andropogon Monticola, Schult. Mant. (1824) p. 665. Perennial; stems densely tufted, 1-4 ft. high, usually slender, erect, simple or branched, leafy chiefly at the base; nodes glabrous. Leaves 2-18 by \(\frac{1}{6}\)-\frac{1}{4}\) in., erect, linear, acute, flat, rigid, glaucous, smooth or scaberulous; sheaths, the upper terete, the lower compressed; ligule a very short ciliate membrane. Paniele 2-5 in. long, ovate or oblong; rhachis slender, smooth or scaberulous; branches 1-2 in. long, whorled, capillary, spreading, at length erect; racemes reduced to a single sessile female and 2 pedicellate spikelets. Scssile spikelets \(\frac{1}{4}\) in. long; callus about \(\frac{1}{3}\) in. long, bearded on one side with rufous hairs. Glumes \(\frac{1}{4}\); lower invol.-glume \(\frac{1}{4}\) in. long, thear, complicate, 2-toothed at the apex, chartaceous, 4-nerved, more or less scaberulous; apper invol.-glume \(\frac{1}{4}\) in. long, ovate-lanceolate, concave, much broader than the lower, ciliate on

the keel with rufous hairs, very shortly toothed at the apex, with an awn \{\}\ in. long and with broadly hyaline margins, 3-nerved; lower floral glume oblong, obtuse, ciliate; upper floral glume narrowly linear, hyaline; awn \{\}\ in. long. Pedicellate spikelets as long as the sessile; pedicels \{\}\frac{1}{2}\ in. long, ciliate with rufous hairs, flattened; lower involglume lanceolate, acute or awned, 7-nerved, scaberulous; upper involglume lanceolate, acuminate, or very shortly awned; floral glumes smaller, oblong, hyaline, ciliate. Fl. B. I. v. 7, p. 192; Trim. Fl. Coyl. v. 5, p. 236; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng. Pl. p. 1202.—Flowers: Oct. Vern. Agiva.

Throughout the Presidency, Liston. Decount: Poons, Woodrow; Khandala, Woodrow, Kolhapur, Woodrow - Distrin. More or less throughout India; Ceylon, Afghanistan S Africa

I have not seen any specimens from the Bombay Presidency and am therefore unable to fix definitely the variety to which the Bombay species belong. They will

probably belong to V sn. Trinu, H. f.

20. Andropogon Aucheri, Boiss. Diag. ser. 1, fasc. 5 (1844) p. 77. Densely tufted; stems 6-18 in. long, simple or sparingly branched, base thickened; nodes glabrous. Leaves 2-1 by 10-1 in., linear, acuto or acuminate, more or less pubescent, sometimes undulate, pale green, often ciliate near the base with bulbous-based hairs; sheaths usually glabrous, very pale, with a few bairs at the mouth; ligule a hairy ridge. Panicle 2-3 in. long; branches in whorls of 4-6, spreading; then subcreet: racemes usually crowded, rarely 2-nate on a branch. Sessile spikelets 1 in. long; callus 11 in. long, villous all over with long silky hairs; lower invol.-glume ; in, long, linear, with 2 short acicular teeth at the apex, minutely ciliate on the margins, obscurely 5-nerved, chartaceous; upper invol.-glume as long as the lower, oblung, obtuse, 1-nerved, chartaceous, with hyaline margins, the keel ciliate above the middle with long silky hairs, and with a slender awn \frac{1}{3} in. long, the awn ciliate below the middle with long hairs; lower floral glume linear, obtuse, hyaline; upper floral glume represented by the dilated base of the awn; awn 7 in. long, base hyaline, dilated. Pedicellate spikelets slightly longer than the sessile, linear-lanceolate, acute; pedicels cuneate, silkyvillous from base to apex, less than 1 as long as the sessile spikelets; lower invol.-glume lanceolate, acute, 1 in. long, 7-nerved; upper invol.glume lanceolate, acuminate, 3-nerved; lower floral glume shorter, hyaline, oblong, acute; upper floral glume lanceolate, acute, 1-nerved, hyaline. Anthers 1 in. long. Fl. B. I. v. 7, p. 195; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438.

Sind. Jemadar ka Landa near Kainchi, Stocks!—Distrib. Afghanistan, N. Africa.

21. Andropogon Cookei, Stapf, ex Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438. A weak straggling much-branched annual; stems reaching 2 it. long, very slender, smooth, quite glabrous; nodes glabrous. Leaves 3-6 by $\frac{1}{8}-\frac{1}{4}$ in., flaccid, finely pointed, sparsely clothed with bulbous-based hairs on both sides, scaberulous; sheaths glabrous; ligule hyaline, ovate, ciliolate. Racemes $\frac{1}{2}-\frac{3}{4}$ in. long, solitary on the apices of the stems and branches; joints between the 2 or 3 lowest nodes continuous, short, cylindric, glabrous, the others about $\frac{1}{15}$ in. long, distarticulating, subclavate, densely ciliate on one

side with long silky hairs which equal or exceed the pedicels; lowest pedicels very short, glabrous, the others vis in, long, ciliate on one side with long silky hairs, dilated into an oblique sac-like mouth above, and produced into a projecting flat horn. Spikelets closely imbricate. straw-colored, scarious. Sessile spikelets 2-sexual (except the lowest which is very often neuter); lower invol.-glume } in. long, oblong or elliptic-oblong, acute, or shortly billid, or sublacerate at the apex. the margins narrowly infolded, rigid, the keels deeply winged with subequal scarious wings about I in deep and more or less toothed on the margins, 7-9-nerved between the keels, the keel-nerves running into the points of the wings; upper invol.-glume shorter than the lower, oblong-lanceolate, obtuse, apiculate, 3-nerved, chartaceous, margins narrowly incurved, keels glabrous; lower floral glume & in. long, oblong, obtuse, hvaline, nerveless, glabrous; upper floral glume reduced to the white flattened lanceolate base of the awn; awn ? in. long, the column much twisted. Pedicellate spikelets longer than the sessile, obliquely lanceolate; lower invol.-glume nearly & in. long. acute, unequally winged, many-nerved; upper invol.-glume & by 3 in., lanceolate, acute, 5-nerved, chartaceous; lower floral glume 1 in. long. oblong, obtuse, hyaline; upper floral glume to in. long, oblong, obtuse, hyaline. Anthers the in. long. Grain & in. long, oblong, compressed. The plant does not agree with Hackel's subgenus Dichanthium very satisfactorily, but it is the only subgenus into which it will fit at all.

DECCAN: Sakar-pathar hill near Lanoli, Woodrow!

22. Andropogon armatus, Hook. f. Fl. B. I. v. 7 (1896) p. 197. Annual, erect; stems 12-18 in, long, tufted, slender, simple or branched above, glabrous and shining; nodes bearded. Leaves 4-6 by 1-1 in., linear, copiously hairy on both surfaces and with long bulbous-based hairs at the base; sheaths lax, glabrous except on the upper margins where they are more or less ciliate, the upper sheaths pale spathiform; ligule 0. Racemes 1-11 in. long, subdigitate, 2 5, flexuous; lowest pair of spikelets male; pedancles 1-1 in. long, capillary, with whorls of long white hairs in their axils; joints and pedicels slender, not grooved, terete, ciliate with silky hairs. Spikelets 10-20 pairs. Sessile spikelets 1 in. long; callus very short, bearded, with silky hairs; lower. tuvol.-glume thin, pale, nerveless, silky below the middle, often with a deep dorsal pit, margins narrowly incurved, keels ciliate; upper invol.-glume ovate, acute, nerveless, subchartaceous, silky-villons on the back; lower floral glume oblong or linear, obtuse, flat, hyaline, nerveless; upper floral glume represented by a slender awn I in. long with an acute base. Pedicellate spikelets equalling the sessile but rather narrower; lower invol.-glume armed with spreading submarginal bulbous-based bristles often 1 in. long or more, slightly convex, quite smooth between the bristles, many-nerved, keels ciliate; upper involglume lanceolate, acute, 3-nerved, ciliate; lover floral glume oblong, obtuse, ceiliate; upper floral glume very narrow. Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438.

KONKAN: Stocke!-Distrib. India (W. Peninsula).

23. Andropogon caricosus, Linn. Sp. Pt. ed. 2 (1763) p. 1480. Stems erect or ascending from a creeping base, forming tufts at the

rooting nodes, 1-2 ft. high, stout or slender, grooved on one side. leafy; nodes usually glabrous, less frequently bearded. Leaves 6-8 by $\frac{1}{10}$ in., linear, finely acuminate, flat, glabrous, sometimes ciliate at the base, the margins scaberulous; sheaths glabrous, compressed. the mouth not auricled; ligule a narrow shortly ciliate membrane. Racemes 1-4 in. long, solitary, 2-nate or subdigitately paniculate. $\frac{1}{8}$ - $\frac{1}{4}$ in. broad, pale green or silvery, the lower sometimes stipitate; joints and pedicels about I as long as the sessile spikelets, ciliate on one margin. Sessile spikelets & in. long; callus short, bearded; lower. invol.-glume 1 in. long, obovate, concave, ciliate at the rounded or truncate apex, 7-9-nerved, subchartaceous; upper invol.-glume longer than the lower, ovate-lanceolate, acute, often apiculate, subchartaceous, ciliate, 3-nerved; lower floral glume as long as the lower invol.-glume, ovate-oblong, subacute, hyaline, nerveless, ciliate; upper floral glume represented by the hyaline not dilated base of the awn; awn 7 in. long, the hyaline base about 1 in. long. Pedicellate spikelets nearly as long as the sessile; lower invol.-glume obovate, obtuse, with narrowly incurved margins and ciliate keels, many-nerved; upper invol.-glume as in the sessile spikelet; lower floral glume ovate-oblong, subacute, hyaline, ciliate; upper floral glume nearly as long as the lower, linear-oblong, obtuse, hyaline. Anthers 10 in. long. Fl. B. I. v. 7, p. 196; Trim. Fl. Ceyl. v. 5, p. 237; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng. Pl. p. 1202.—Flowers: Dec.

24. Andropogon annulatus, Forsk. Fl. Egypt. Arab. (1775) p. 173. Perennial, densely tufted; stem erect or ascending, usually simple, 6-36 in. long; nodes usually bearded. Leaves 3-12 by 1-1 in., linear, finely acuminate, glaucous, glabrous or more or less sparsely hairy above with small bulbous-based hairs, the margins scabrid; sheaths bearded at the tip; ligule nearly $\frac{1}{8}$ in long, oblong, obtuse, membranous, glabrous. Racemes 1-24 in. long, subdigitately fascicled, pinkish or nearly white; peduncles glabrous, 1-1 in. long; joints and pedicels 1 as long as the spikelets, sparingly cliate. Sessile spikelets about 1 in. long, but variable in length, elliptic-oblong, closely imbricating; callus thick, shortly bearded at the base; lower invol.-glume elliptic-oblong, obtuse, ciliolate at the rounded or truncate apex, thin, margins narrowly incurved, the keels ciliate, the back hairy or glabrous, 5-9-nerved, the nerves not reaching the tip; upper invol.-glume equalling the lower but narrower, lanceolate, subacute, glabrous or ciliolate, 3-nerved; lower floral glume as long as the upper involglume, linear-oblong, obtuse, nerveless, glabrous; upper floral glume represented by the flattened white base of a scabrid slender awn 4 in. long. Pedicellate spikelets about equalling the sessile, male or neuter; lower invol.-glume elliptic-oblong, obtuse, 7-11-nerved, the keels bristly; upper invol.-glume narrower, 3-nerved; lower floral glume ciliate; upper floral glume small or obsolete. Fl. B. I. v. 7, p. 196; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng. Pl. p. 1202. Andropogon scandens, Roxb. Fl. 1nd. v. 1 (1832) p. 258;

25. Andropogon polystachyos, Roab. Fl. Ind. v. 1 (1832) p. 261. A dwarf erect grass 6-10 in. high; stems slender, leafy above, corymbosely branched. Leaves 2-4 by $\frac{1}{10}$ $\frac{1}{10}$ in., the lower flat, the upper convolute, erect, hairy on both sides with long slender hairs, the margins thickened; sheaths hairy; ligule a short ciliate membrane. Racemes solitary, 1-1 in. long, on very slender peduncles 2-4 in. long, with a very slender sheath and a small leaf about the middle, the 5 or 6 lower pairs of spikelets neuter; joints 1 in. long, terete. Sessile female spikelets dark brown, I in, long; callus bearded on one side with brown hairs; lower invol.-glume oblong when opened out, obtuse, with membranous tip and infolded margins, 7-9-nerved, pubescent on the back; upper invol.-glume linear-oblong with a coriaceous centre and broad hyaline margins; lower floral glume shorter, oblong, ciliate; upper floral glume represented by the acute base of the awn; awn 11-2 in. long, hairy. Pedicellate spikelets 1 in. long; pedicels in, long, glabrous; lower invol.-glume with a coriaceous manynerved centre and broad hyaline wings; upper invol.-glume lanceolate, Neuter spikelets: lower invol.-glumo like the ciliate, 5-nerved. pedicellate but broader, 2-toothed at the tip. Fl. B. I. v. 7, p. 202; Dale, & Gibs. p. 301; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 135.-Flowers: Nov.

26. Andropogon triticeus, R. Br. Prol. (1510) p. 201. Perenmial; roots of very stout tortuous fibres; stem 1 8 ft. high, as thick ns a swan's quill below, hard, smooth, polished, leafy, simple or branched below. Leaves 1-2 ft. by \{-\} in., narrowly linear, acuminate, glancous, sparsely hairy, margins scabrous; sheaths compressed, keeled, smooth; ligule a rounded scarcely citolate membrane. Racemes 3-6 in. long; rhachis inarticulate except the 1-6 upper nodes, glabrous; spikelets very many, all, except the few terminal, closely imbritating, subsecund, awnless, male or neuter with a short glabrous callus. Upper sessile spikelets long-awned, & in. long; callus long, acute, densely bearded with dark brown hairs; lower involglume linear-oblong, subterete, rigidly coriaceous, with an obtuse rounded membranous ciliolate tip, dorsally deeply grooved, the margins involute, not winged; upper invol.-glume slightly longer than the lower, linear, subterete, rigidly coriaceous, scaberulous, with pale sigmoidly incurved chartaceous margins, obtuse, with membranous truncate or minutely 3-toothed tip; lower floral glume short, oblong, truncate, hyaline, nerveless; upper floral glumo represented by the flattened white base of the awn; awn very stout, hirsute, 2-3 in. long. Upper pedicellate spikelets reaching I in long, neuter; pedicels very short, subclavate, glabrous; lower involvedume more or less twisted.

lanceolate, acuminate, many-nerved; upper invol.-glume rather shorter than the lower, linear-lanceolate, acuminate, ciliate, chartaceous, 3-nerved; lower floral glume-shorter than the invol.-glumes, lanceolate, acuminate, ciliate; upper floral glume narrowly-oblanceolate, 1-nerved, ciliate near the apex. Lower spikelets 1-1 in long, neuter or male, like the pedicellate ones. Fl. B. I. v. 7, p. 200; Trim. Fl. Ceyl. v. 5, p. 239; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438.— Flowers: Dec.

27. Andropogon Ritchiei, Hook. f. Fl. B. I. v. 7 (1896) p. 201. Stems stout, erect, rigid, 4 ft. and more high. Leaves 18 by 3 in., linear from a narrow base, bluntly acuminate, flat, rigid, shortly hairy on both sides with bulbous-based hairs, the margins spinulosely serrulate; sheaths glabrous; ligule } in. long, membranous, divided almost to the base into numerous narrow acute segments. Racemes 1-2 in. long, green, hispid, the lower 1-2 pairs of spikelets homogamous. Sessile spikelets rather more than 1 in. long; callus nearly 10 in. long, densely bristly with brown hairs; lower invol.-glume broadly ovate when opened out, bluntly acuminate, truncate, hairy on the back. the margins narrowly incurved, keels bristly, not channelled, dorsally obscurely nerved; upper invol.-glume linear-oblong with rounded and shortly apiculate apex, 3-nerved, with a coriaceous hispid centre and membranous margins; lower floral glume & in. long, narrowly linear, subacute, hyaline, nerveless; upper floral glume represented by the acute not dilated base of the awn; awn more than 14 in. long, tortuous, with a dark brown more or less pubescent column, the upper part very slender. Pedicellate spikelets 1 in. long; pedicels short, glabrous; lower invol.-glume lanceolate, acute, the margins equally winged and infolded, the keels with a row of long tubercular-based golden-vellow bristles; upper invol.-glume as long, lanceolate, 3-nerved; lower floral glume 3 in. long, narrowly oblanceolate, hynline; upper floral gluine shorter, narrowly linear, acute. Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438.—Flowers: Oct.-Dec.

DECEAN: bills near Poona, Woodrow. S. M. Country: Belgaum, Ritchie!—Distrib. India (W. Pennsula).

28. Andropogon contortus, Linn. Sp. Pl. (1753) p. 1045. Perennial; stems 1-5 ft. long, densely tuffed, erect or decumbent below, slender, leafy chiefly at the base, simple or subfastigiately branched, compressed towards the base. Leaves 6-12 by \(\frac{1}{0} - \frac{1}{3}\) in., linear, often shortly and abruptly (rarely long)-acuminate, flat, suberect, rigid, often sparingly ciliate towards the base, sometimes with scattered bulbous-based hairs above, scaberulous below; sheaths compressed, keeled, glabrous, the mouth shortly auricled; ligule short, truncate, ciliolate. Racemes 1\frac{1}{2}-3 in. long; internodes very short, the lower inarticulate; spikelets closely imbricating, subsecund, the lower 2-6 or more sessile, awnless, male or neuter, the upper sessile spikelets narrow, long-awned, female. Sessile (female) spikelets \(\frac{1}{4}\) in. long; callus long, acute, pungent, bearded with reddish-brown hairs; lower invol.-glume linear-oblong, truncate, dark brown, many-

nerved, hispidulous, margins strongly incurved (not winged), tip membranous; upper invol.-glume linear, obtuse, concave, rigidly coriaceous, dark brown, hispidulous; lower floral glume short, oblong. truncate, nerveless; upper floral glume represented by the subulate white base of a hir-ute awn which reaches 3 in. or more long. Pedicellate spikelets much longer than the sessile (\frac{1}{2}-\frac{1}{2} in, long); pedicel very short; lower invol-glumo lanceolate, usually obliquely twisted, herbaceous, dorsally hispid with long bulbous-based hairs, the margins more or less (often unequally) winged, the wings serrulate; upper invol.-glume oblong-lanccolate, acuminate, 5-nerved, margins hyaline: lower floral glume oblong, I-nerved; upper floral glume obovate-oblong. ciliate, nerveless. Louer sessile spikelets like the pedicellate, more or less covered with bulbous-bised hairs. Fl. B. I. v. 7, p. 199; Grah. Cat. p. 235; Dalz. & Gibs. p. 300; Trim. Fl. Ceyl. v. 5, p. 238; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng. Pl. p. 1202; Watt, Diet. Econ. Prod. v. 1, p. 244.-Flowers: Nov. YERS, Kursali.

Common throughout the Presidency. It is a very troublesome weed, the long awas twisting tegether like the strands of a rope and the sharp callus of the spikelets sticking into the hides of animals. It is a great annoyance to sportsmen, who come out of a patch of the grass with their lower garments covered with the awas. The grass is known to Anglo-Indians as Spear Grass—Distant. Tropics generally.

Andropogon Sorphum, Brot. Fl. Lusit. v. 1 (1804) p. 88. A tall hand-ome grass, usually very robust, with a decompound paniele, extensively cultivated throughout India for its grain. Whether originally a native of India is very doubtful; no Indian writer records having found it wild or naturalized. It is cultivated in the warmer parts of Europe, Asia and Africa, has been introduced into America and Australia, and is known as the Great Millet. Fl. B. I. v. 7, p. 183; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng. Pl. 1201. Sorphum vulgare, Pers. Syn. v. 1 (1805) p. 101; Watt, Dict. Econ. Prod. v. 6, part 3, p. 289. Holeus Sorphum, Linn. Sp. Pl. (1753) p. 1047; Grah. Cat. p. 238; Dalz. & Gibs. Suppl. p. 99.—Vens. Jundla; Judri.

Andropogon squarrosus, Linn. f. Suppl. (1781) p. 433. The Khas-Khas: cultivated but not apparently indigenous in Bombay. The roots are made into mats which are known as tattis and hung over doors and kept wet to cool the atmosphere during the hot season. The aroma from the wetted roots is very agreeable. Fl. B. I. v. 7, p. 186; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng. Pl. p. 1201. Andropogon muricatus, Retz. Obs. fase. 3 (1783) p. 43; Grah. Cat. p. 238; Dala & Gibs. p. 302; Watt, Diet. Econ. Prod. v. 1, p. 245.

Andropogon Schwanathus, Linn. Sp. Pl. (1753) p. 1046. The Lemon-Grass; cultivated extensively in the Bombay Presidency for the manufacture of Lemon-Grass oil, which is used as an external application in rheumatic affections. The oil is made largely in Khandesh and in the Panch Maháls and sells at a high price. Fl. B. I. v. 7, p. 204; Grah. Cat. p. 238; Dalz. & Gibs. Suppl. p. 99; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 438; Prain, Beng. Pl. p. 1200; Watt, Diet. Econ. Prod. v. 1, p. 249.—Virn. Surveii.

32. PSEUDANTHISTIRIA, Hook. f.

Annual grasses. Leaves narrow. Panicle leafy; branches slender. filiform, each bearing a single raceme clothed by a proper spathe, the racemes subumbellate, the umbel subtended by a common spathe. Proper spathes lanceolate or linear-lanceolate, acuminate, keeled. Spikelets within each proper spathe usually consisting of 1 sessile 2-sexual spikelet with 1 pedicellate male and a secund sessile 2-sexual spikelet with 2 pedicellate males. Sessile 2-sexual spikelets with a short callus; lower invol.-glume chartaceous, truncate, with inflexed margins. 4-7-nerved, the nerves apparent only towards the apex; upper invol. glume equalling the lower, linear-lanceolate, glabrous, 3-nerved, membranous; lower floral glume small, quadrate; upper floral glume represented by the hyaline base of a long capillary geniculate awn. Lodicules cuneate. Pedicellate male spikelets on slender pedicels: lower invol.-glume thin, about 9-nerved, margins narrowly incurved; upper invol.-glume 3-nerved; lower floral glume very small, oblong. Stamens 3; anthers linear. Styles short; stigmas short, exserted. Grain small.—DISTRIB. India; species 4.

1. Pseudanthistiria hispida, Hook. f. Fl. B. I. v. 7 (1896) p. 219. Annual; stem 1-2 ft. high, rather stout, erect, glabrons and polished; nodes glabrous. Leaves 2-5 by 1-1 in., linear, finely acuminate, sometimes with a bristle-point, hairy on both surfaces with bulbous-based hairs, more or less subspinulosely ciliate on the margins, strongly nerved; sheaths hairy on the upper part with bulbous-based hairs, usually glabrous below; ligule a truncate glabrous membrane much divided to the base into narrow segments, the tips minutely ciliolate. Panicle elongate, simple; branches very slender, reaching 3 in. long, often in pairs; fascicles $\frac{3}{4}$ in. broad, copiously hirsute with bulbousbased hairs; outer spathes 1; in, long or more; proper spathes much longer than the racemes, all hirsute on the margins with strong bristles from tubercular bases. Sessile spikelets in long; callus shortly bearded; lower invol.-glume ; in. long, oblong, truncate at the membranous ciliolate apex, with narrowly infolded margins and obscure nerves, glabrous; upper invol.-glume as long as the lower, oblong, obtuse, 3-nerved with hyaline margins; lower floral glume small, quadrate; upper floral glume represented by the very acute base of the awn; awn 1-1 in. long. Pedicellate spikelets lanceolate, hairy; pedicels finely hairy. Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 439 .-Flowers: Oct.-Nov. VERN. Pokalya.

Dollett without locality in Herb. Kew. 1 Konran: Stocks!; Kalyan, Woodrow, Deccan: Panchgani, Woodrow. S. M. Country: Londa, Woodrow.—Distrib. India (Contral Provinces, W. Peninsula).

33. **THEMEDA**, Forsk. (1775).

ANTHISTIRIA, Linn. f. (1779).

Tall annual or perennial grasses. Leaves long, narrow. Spikelets heteromorphous, clustered on the articulate fragile rhachis of short solitary racemes subtended by proper spathes and crowded in paniculate fascicles; lowest 2 pairs of each raceme closely approximate, male or barren, awuless, sessile or subsessile, usually persistent, forming a

spurious tetramerous whorl enveloping the upper 1-3 pairs, each of which consists of a sessile hermaphrodite, and a pedicellate male spikelet, the latter much resembling those of the involucre. Florets 2, the lower reduced to an empty glume, the upper hermaphrodite in the sessile upper spikelets, male in the involucral and pedicellate spikelets or these more or less reduced or barren. Bisexual spikelets: invol.-glumes equal or subequal; lower usually coriaceous, at length hardened and often dark brown to almost black; upper obtusely keeled, coriaceous and channelled along the keel, with membranous margins; lower floral glume hvaline; upper very narrow, passing from a hyaline base into a usually stout awn, very rarely linear and awnless. Palea obsolete or 0. Lodicules 2, cuncate, glabrous. Stamens 3. Stigmas laterally or subterminally exserted. Grain linear-obovoid, biconvex, with 2 grooves on the anterior side. Involucial and pedicellate spikdets: involuglumes equal or subequal; lower herbaceous, dorsally flattened, 2-keeled, manynerved; upper membranous, lanceolate, acute, 3-nerved, with cihate margins; lower floral glume hyaline, 1-nerved or like the upper suppressed.—District. Tropical and subtropical regions of the world; species about 10.

Involueral spikelets truly verticiliate. Perennial		
Inflorescence a decompound thyrisform pamele; lower invol- glung of baseu d spikelets not channelled.	3.	T. cymbaria,
Inflorescence a raceanform panels; lower invol-glumo of	٠ j .	T. tremula.

1. Themeda imberbis, T. Cooke. Perennial, densely tufted; stem 1-3 ft. high, stout or slender, erect, or geniculate and ascending, subsimple or branched, glabrous, polished; nodes glabrous. Leaves 3-8 by alied in a narrowly linear, finely acuminate, corraccous, flat, rather rigid, margins scabrid; sheaths compressed, keeled, smooth; ligule a narrow ciliolate membrane. Panicle narrow, racemiform, 3 8 m. long, sparingly branched; branches solitary or the upper 2-3-nate, filiform, bearing capituliform usually dense distant fascicles of racemes; spathes lanceolate, obtasely acuminate, about 1 in, long, usually bearded at the base, glabrous or sparsely hairy, greenish or tinged with red; racemes 1-7 in. long. Involveral epikelets whorled, sessile, persistent, lanceolate, neute or acuminate, 1-2 in. long, glabrous or with short bulbous-based hairs. male; glumes 3. Palicellate spikelets linear-lanceolate, glabrous, on short glabrous or subglabrous pedicels. Bisecual spikelet solitary, 4 in. long; callus reaching } in, long, pungent, bearded with colored hairs. Lower invol.-glume obtuse or notched, smooth except the tip, dark brown, not dorsally channelled, obscurely 7-9-nerved; upper involglume glabrous; lower floral glume glabrous, rather shorter than the invol-glumes; upper floral glume awned; awn 14-21 in, long with a stout hispid column. Anthers 1/2 in long. Grain 1/0 in long, oblong, grooved ventrally. Themeda Forskahlii (Forskalii) var. vulgaris, Hack. Monog, Andropog, in DC, Monog, Phan, v. 6 (1889) p. 660. Anthistiria imberbia, Retz. Obs. fasc. 3 (1783) p. 11; Hook, f. Fl. B. I. v. 7, p. 211; Trim, Fl. Ceyl, v. 5, p. 248; Woodr, in Journ, Bomb. Nat. v. 13 (1901) p. 439; Prain, Beng. Pl. p. 1207. A. ciliata, Retz. Obs. fasc. 3 (1783) VOL. II.

p 11 (not of Linn.); Grah. Cat. p. 239; Dalz. & Gibs. p. 304; Watt, Diet. Econ. Prod. v. 1, p. 265.

Common throughout the Presidency, largely used for hay. - DISTRIB. Hotter and drier parts of India; Ceylon, warm regions of the Old World.

2. Themeda ciliata, Hack. Monog. Andropog. in DC, Monog. Phan. v. 6 (1889) p. 664. Annual; stems subcreet or geniculately ascending and rooting from the lower nodes, very slender, terete. 1-3 ft. high. glabrous, simple or branched. Leaves 6-12 by 1-1 in., linear, acute, flat, flaccid, glabrous or hairy; sheaths, glabrous or the upper with scattered bulbous-based hairs towards the mouth; ligules membranous. rounded, 1/2 in. long, glabrous. Panicle subcreet, occupying 1-2 of the stem, usually dense; lower branches solitary or 2-3-nate, filiform. glabrous, undivided often to the middle, then bearing at equal distances usually shortly pedunculate dense clusters of racemes; spathes linear to subulate from a broad lanceolate base, 3-1 in, long, glabrous or with scattered bulbous-based bristles; racemes 1-1 in. long, erect. Involucral spikelets whorled, sessile, persistent, linear-lanceolate, acute or acuminate, 1-1 in. long, reddish, barren or imperfectly male; lower invol.glume beset along the winged keels with stiff bristles from large tubercular bases, otherwise glabrous. Pedicellate spikelets narrow, not winged. glabrous. Bisexual spikelet solitary, not exserted from the involuere. $\frac{1}{6-5}$ in, long, narrow, linear-lanceolate; callus very short, subobtuse, bearded with short reddish hairs; lower invol-glume obtuse, brown. shining, obscurely 6-7-nerved; upper invol.-glume glabrous; lower floral glume shorter than the invol.-glumes, sometimes 2-toothed: upper floral glume award; awn 1-11 in. long, slender. Anthers 15 in. long. Anthisticia ciliata, Linn. f. Suppl. (1781) p. 113; Hook. f. Fl. B. I. v. 7. p. 213; Woodr, in Journ, Bomb, Nat. v. 13 (1901) p. 439; Prain, Beng. Pl. p. 1207.—Flowers: Sept.-Jan.

Konkan: S. Konkan, Law:; Salsette, Jacquemont, 717! Decean: Woodrow! S. M. Counter: Belgaum, Ritchie, 886!—Distrib. India (North-west, Bengal, Central Provinces, W. Peninsula); S. Africa.

3. Themeda cymbaria, Hack. Monog. Andropog. in DC. Monog. Phan. v. 6 (1889) p. 668. Perennial; stems 3-8 ft, high, as thick as a swan's quill below, erect, branched, smooth, clothed at the base with broad strongly compressed equitant leaf-sheaths together 1!-2 in. ncross; internodes long; nodes glabrous or puberulous. Leaves 2-4 ft. by 1-1 in., linear, finely pointed, glaucous beneath, green above, glabrous or ciliate at the base, scaberulous above, smooth beneath, margins scabrid; sheaths subcompressed, keeled, smooth, usually bearded at the mouth, the lower \(\frac{1}{2} \) in. broad at the base; ligule reddish, membranous, glabrous. Paniele 1-2 ft. long, occupying nearly \(\frac{1}{2} \) the stem, supra-decompound; branches loaded with small shortly pedunculate oblong fascicles 1-1 in. long, of nearly glabrous racemes; proper spathes \(\frac{1}{2} - \frac{3}{3}\) in. long, linear-lanceolate, boat-shaped, acuminate, finely pointed, glabrous or with hairy margins. Involucral spikelets 1-1 in. long, contiguous in superposed pairs, glabrous. Pedicellate spikelets with glabrous pedicels. Bisexual spikelets solitary (rarely 2), subsessile; callus short, bearded with white hairs; lower invol.-glume 1 in. long, dorsally convex, not channelled, smooth, polished, dark brown; awn in. long, slender, smooth. Anthistiria Cymbaria, Roxb. Hort. Beng.

(1814) p. 6; Grah. Cat. p. 239; Dalz. & Gibs. p. 301; Hook. f. Fl. B. I. v. 7, p. 215; Trim. Fl. Ceyl. v. 5, p. 249.

KONKAN: common.—Distrib, India (W. Peninsula); Ceylon.

4. Themeda tremula, Hack, Monog, Andropog, in DC. Monog. Phan. v. 6 (1889) p. 667. Annual?; stems erect or ascending from a creeping rootstock, 1-4 ft. high, stout or slender, leafy, subterete, simple or branched, smooth, polished, brown. Leaves 4-20 by \frac{1}{2} -\frac{1}{2} \text{ in.,} finely acuminate with setaceous tips, rigid, subcreet, green, glabrous or nearly so, margins scabrid; sheaths slightly compressed, smooth; ligule reduced to a very narrow membrane. Panicle 1-2 ft, long, occupying 1-1 the stem, racemiform; fascicles of racemes rather distant, on capillary flexuous peduncles 1-3 in. long, subflabelliform or subglobose, 3-13 in. broad, sometimes reduced to a few spathes and spikelets; outer spathes longer than the fascicles, 1 1! in. long, more or less hairy with simple or bulbous-based hairs; proper spathes $3-\frac{3}{4}$ in. long, lanceolate, acute, compressed, glabrous or with some bulbousbased hairs, margins scarious. Involucral spikelets in contiguous superposed pairs reaching 4 in. long, green tinged with red; lower invol.glume linear-lanceolate, acuminate, covered with long often bulbous-based bristles, many-nerved; upper invol.-glume oblong-lanceolate, acuminate, 1-nerved, ciliate above the middle, margins inflexed; lower floral glume as long, very narrowly linear, hyaline, 1-nerved. Lodicules cuneate. Anthers in long. Pedicellate spikelets like the involucral, but nearly glabrous. Glumes 3; lower invol.-glumo winged on one margin, nerveless, the other two as in the involueral spikelets. Bisexual spikelets 2, sessile, & in. long, linear-oblong, obtuse; callus small, with a short reddish beard; lower invol.-glume scabrid, deeply channelled dorsally, nerveless, tip hispid, narrowly truncate; awn \frac{1}{2}-1 in. long. Anthisticia tremula, Nees, ex Steud. Syn. Gram. (1855) p. 401; Hook. f. Fl. B. 1. v. 7, p. 214; Trim. Fl. Ceyl. v. 5, p. 249; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 439.—Flowers: Oct.

DECENT: Poona, Woodrow, - Distrain. India (W. Peninsula); Ceylon.

34. ISEILEMA, Hack.

Small annual or perennial grasses; stems slender, compressed, manynoded. Leaves linear from a usually rounded equilateral base; sheaths compressed, keeled, shorter than the internodes. Paniele usually occupying 1 the stem; branches usually fascicled and interspersed with scarious spathe-like bracts; proper spathes boat-shaped, acute, compressed, more or less herbaceous on the back, many-nerved, with scarious margins; racemes fasciculiform, solitary at the apex of the stem and branches, articulate with the peduncle below the lowest spikelets, at length all falling away from it. Spikelets dimorphous, the 4 lower whorled, male or neuter, forming an involucre round the in-Involucral spikelets pedicellate; pedicels short, : articulate rhachis. flattened. Glumes 3; lower invol.-glume oblong-lanceolate, 3-5-nerved; upper invol.-glume similar, 3-nerved; floral glume hyaline, 1-nerved. Lodicules cuneate, retuse. Anthers violet. Pedicellate spikelets on long slender pedicels, similar to the involucral. Bisexual spikelets lanceolate or linear-lanceolate; lower invol.-glume truncate or shortly 2-fid at the 3 T 2

tip; upper invol.-glume as long, muticous, hyaline, glabrous; lower floral glume small, sometimes wanting; upper floral glume an awn

longer than the spikelet.

As remarked by Hackel (Monog. Andropog. p. 679) the dispersion of the spikelets of *Iseilema* is by the wind carrying away all the spikelets in a body, whereas in *Themeda* the bisexual glumes alone disarticulate and are probably carried away by adhesion to the coats of animals.—Distrib. Tropical Asia and Australia; species 5.

1. Iseilema Wightii, Anders. in Nov. Act. Soc. Sc. Upsal. ser. 3. v. 2 (1858) p. 251. Perennial; stems often prostrate and rooting at base, then ascending, 8-36 in, long, rarely as thick at the base as a goose-quill; nodes more or less bearded. Leaves 4-8 by $\frac{1}{12}$ in., linear, acute, glaucescent or sometimes as well as the whole plant reddish, smooth or scaberulous, the floral leaves scabrid with tuberculate margins; sheaths lax, sometimes with bulbous-based hairs; ligule short truncate, membranous, ciliate. Panicle occupying ! the stem or more, linear-oblong, more or less compound, erect, spreading; rhachis bearded at the nodes; lower branches 2, the upper as many as 5; proper spathes 1-1 in. long, linear-lanceolate, with scarious margins. Involucial spikelets male or neuter, \frac{1}{2} in. long, shortly pedicellate, lanceolate-oblong, green or tinged with violet; lower invol.-glume subacute, with 5 elevated ribs on the back, sulcate between the ribs; upper invol.-glume glabrous with broadly infolded margins, 1-nerved; lower floral glume much shorter, oblong, 2-3-toothed, nerveless, glabrous. Anthers 16 in. long. Pedicellute spikelets on very slender pedicels. Bisexual spikelets 16-8 in. long; lower invol.-glume acute (not acuminate nor beaked), obscurely 4-nerved; upper invol.-glume equalling the lower, elliptic-lanceolate, neute or subobtuse, often mucronate, obtusely keeled on the back, 3-nerved, glabrous; upper floral glume an awn $\frac{1}{4}-\frac{1}{2}$ in, long, the column exceeding the subulate part. Fl. B. I. v. 7, p. 218; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 439; Watt, Diet, Econ. Prod. v. 4, p. 524. -Flowers: Nov.

DECEM: Poona, Woodrow. S. M. Country: Belgaum, Woodrow. Gujarat: Morvi (Kathiawar), Woodrow.—Distrib. Throughout India.

2. Iseilema laxum, Hack. Monog. Andropog. in DC. Monog. Phan. v. 6 (1889) p. 682. Perennial; stems 6-20 in. long, ascending from a stout hard sometimes shortly creeping rootstock, very slender, simple or sparingly branched; root-fibres wiry. Leaves all cauline or the lower radical with equitant sheaths, 3-6 by $\frac{1}{26}$ - $\frac{1}{3}$ in., linear, obtuse or subobtuse, glabrous but often ciliate near the base, scaberulous above, smooth below, the margins scabrid; sheaths lax, quite glabrous; ligule short, truncate, membranous, ciliate. Panicle occupying $\frac{1}{3}$ - $\frac{1}{2}$ the stem, racemiform, long, narrow, of distant axillary pedunculate fascicles $\frac{1}{3}$ - $\frac{1}{2}$ in. long; outer spathes $\frac{1}{3}$ -1 in. long, narrowly lanceolate, glabrous or with a few hairs near the margin; proper spathes $\frac{1}{3}$ - $\frac{1}{2}$ in. long, elliptic-lanceolate. Involucial spikelets truly whorled, $\frac{1}{6}$ in. long, pedicellute, oblong-lanceolate, acute; pedicels short, flattened, bearded at

the base; lower invol.-glume acute, sparsely ciliate, 3-5-nerved; upper invol.-glume oblong-lanceolate, acuminate, sparsely ciliate, 3-nerved lower floral glume linear, glabrous, hyaline. Lodicules cuneate, retuse. Anthers long, narrow. Pedicellate spikelets on long ciliate pedicels, linceolate, glabrous. Biscaual spikelets in arrowly linceolate, \(\frac{1}{2}\) in long, narrowed into a slender stipe, glabrous; lower invol.-glume chartaceous, 2-find or truncate at the tip, margins scaberulous in the upper third, thin, finitly 3-5-nerved; upper invol.-glume lanceolate, acuminate, 1-nerved, tip scaberulous; upper floral glume a very slender geniculate awn, \(\frac{1}{2}\)-\(\frac{1}{2}\) in, long, the column equalling the subulate part. If B. I. v. 7, p. 218; Trim. Fl. Cevl. v. 5, p. 251; Woodr, in Journ. Bomb. Nat. 13 (1901) p. 139; Prain, Beng. Pl. p. 1208; Watt, Diet. Econ. Prod. v. 1, p. 521.—Flowers: Nov.-Dec.

35. COIX, Linn.

Tall lerfy monocous annual or perennial grasses; stem branching, spongy within. Leaves long, flat, broad. Racemes many, axillary and triminal; lower spikelets solitary, female, enclosed in an ultimately bardened, polished, nut-like bract, through the apex of which the male portion of the spike protrudes. Male spikelets 2-3-nite at each node of the rhache, i sessile and i or 2 pedicellate, lanceolate. Glumes i; invol.-glumes subequal, empty, rigid or herbaceous; lower invol-glume winged along the inflexed uargin; upper invol.-glume not winged; floral glumes by thine, paleate, transforms or empty. Flavous spikelels ovoid, asiminate. Glumes 1; lower invol.-glume chartaceous, the other 3 glumes becoming successively thinner; upper floral glume paleate. Lodicules 0. Staminodes minute. Overvovoid; styles 2, free, slender. Grum orbicular, ventrally turrowed, enclosed in the hardened globose ovoid or cylindric involucre.—Distrib. Species 3 or 4, in the warmer regions of the globe.

1. Coix Lachryma-Jobi, Lom. Sp. Pl. (1753) p. 972. Stem 3-5 tt. high or more, stout, rooting at the lower nodes, internodes smooth, polished. Lewes 1-18 by 1-2 m., nuroued from a broad cordate base to an acuminate tip, smooth on both surfaces, with slender nerves and spinulosely serrate margins; midrib stout; sheaths long, smooth; ligule a very narow membrane. Racemes 1-24 m, long, nodding or drooping from long peduncles; thathis within the brack elender, above the brief stout, notched at the nodes. Mill spikelers 3-1 m. long, subsecund, imbricating. Lower invol.-glume & m. long, Cliptic-lanccolate, acute, concave, many-nerved, with inflexed margins and with a narrow wing arising from a little above the edge of the margin with many branched given veins; upper invol.-gluine similar to the lower but not winged, 5-9-nerved; lower floral glume oblonglance olate, hyaline, pileate, triandrous, faintly 3-5-nerved; upper floral glume similar, paleate, triandrous or empty. Anthers & in. long, Thur from broadly avoid to globase, blush-grey, 1-3 m. long, smooth, polished. H. B. I. v. 7, p. 100; Trim. Fl. Ceyl. v. 5, n. 192; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 436; Prain,

KONKAN' Graham Dicers Graham, Laudi, Woodrow; Panchgani Ghit, Cooke! Gusinst. Graham.—Distrib Throughout the holter and distributed; Ceylon, Tropical Asia, cultivated in Africa and America

36. POLYTOCA, Br.

Tall stout erect branching annual or perennial leafy monocious grasses; stem spongy within; nodes bearded; flowering branches Leaves long, flat. Inflorescence of spike-like racemes, terminating the branches, at first enclosed in spathiform bracts; racemes all male or with one or more female spikelets at the base. Mice SPIKELLIS 2-flowered, sometimes imperfect. Clumes 4 (with sometimes a terminal rudimentary one), all subequal in length; invol.-glumes empty; lower invol.-glume herbaccous, shallowly concave, many-nerved, with a narrow membratious margin; upper invol-glume narrower, orate, acuminate, 5-9-nerved; lower floral glume membranous, oblong, acuminate, 3-5-nerved, paleate, mandrous; upper floral glume very slender, linear, hyaline, pileate, triandrous or empty. Lodicules 2, cancate. Anthers long. Fumale spikeless broadly oblong, 1-flowered; lower myol, glume thickly corraceous, closely embracing the rhachis of the spike by its involute margins, with many obscure nerves, the other 3 glumes enclosed in the lower invol.-glume, hyaline; upper involglume oblong, many-nerved; lower floral glume narrower, oblong, 3-5-nerved, empty; upper floral glume very narrow, truncate, 3-nerved, paleate. Styles very long; stigmas slender. Grain small, fusiform, terete, enclosed in the nut-like polished hardened glume.—Distain. Species 8, tropical Asiatic and Australian.

1. Polytoca Cookei, Stapf, in Hook. Icon. Plant. v. 24 (1895) t. 2333. Annual; stem 3 ft. (or more) high, smooth; nodes bearded. Leaves 18-24 by 2-3 in., linear-lanceolate, acuminate, more or less hispid on both sides with bulbous-based hairs, and with thickened and chate margins; sheaths rather loose, striate, harry with bulbousbased hans; figule short, subhyaline, hairy with yellowish hairs. Flowering branches fasciculately crowded in the axils of the upper leaves, each with a linear acuminate pubescent bract at the base. Male panicles reaching 3 in. long. Main spikilers] in. long, geminate, one longer than the other, shortly pedicellate or sessile, Glumes 4; lower invol.-glume lanceolate, acuminate, pubescent, manynerved, with a hyaline more or less inflexed margin; upper involglume slightly shorter and thinner than the lower one, with slender nerves. Floral glumes slightly shorter than the lower invol.-glume, glabrous, few-nerved, hyalme. Anthers 3, hnear. Female spikellis 1 m. long; lower invol.-glume crustaceous, oblong, the margins connate at the base; closely embracing the upper invol.-glume, the aper with a 3-lobed crest the lateral lobes of which are obliquely truncate, the

midlobe emarginate; upper invol.-glume slightly shorter than the lower, oblong, acummate; lower floral glume about equalling the upper invol.-glume, oblong, suddenly apiculate, 13-15-nerved; upper floral glume shorter than the lower, hyaline, nerveless, sometimes 2-fid. Fl. B. I. v. 7, p. 101; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436.— Flowers: Sept. Vern. Kurisal.

Konkin: Stocks', Law', Lishoa, Bombay, Dalzell', Salsette, Jacquemont, 706' Deccan: Mahableshwar, Hoodrow', Cooke' Kanira: N Kanira, Lishoa—Distrib India (W Peninsula)

2. Polytoca barbata, Stapf, in Fl. B. I. v. 7 (1896) p. 102. Stem 3-6 ft. high, as thick as the little finger below, terete, smooth; nodes softly bearded. Leaves 6-12 by $\frac{1}{4} - \frac{7}{8}$ in., linear, acuminate, scabrid above, with a stout midrib and scabrid margins; sheaths long, smooth, glabrous or hairy; ligule a narrow ridge. Racemes paniculate, on slender peduncles; spathiform sheaths 1 in. long (or more), with a long awn at the tip; proper sheaths \(\frac{1}{2}\) in. long, oblong, awned; male portion of the raceme appearing as if sessile on the top of the female spikelet, articulate with the internode below it which is embraced by the margins of the outer glume of the female spikelet; rhachis hardly articulate between the male spikelets. MALE SPIKELETS reaching 3 m. long. Lower invol.-glume } by } in , ovate, acute, concave, pubescent. Female spikelers 1 in. long, glabious. Glumes 4; lower invol.-glume thickly cornceous, white, shining, closely wrapped round the rhachis of the spike and the other glumes, obscurely many-nerved; tip entire. Trim. Fl. Ceyl. v. 5, p. 194; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436; Prain, Beng. Pl. p. 1209. Coix barbata, Roxb, Fl. Ind. v. 3 (1832) p. 569; Dalz. & Gibs. p. 289.—Flowers · Sept. View. Kanta-karvel.

Drecan: high hills round Junnar (Poona districts), Dalzell & Gibson, Peona, Woodrow.—Distrib. More or less throughout Indu, Ceylon, Java.

37. ARUNDINELLA, Raddi.

Perennial or annual erect grasses. Leaves narrow. Spikelets paniculate, continuous with or imperfectly jointed on the pedicels; rhachilla not produced beyond the upper floret. Glumes 4, membranous, chartaceous or thinly coriaceous; invol.-glumes acute or acuminate, 3-5-nerved, the upper usually the longer, lower floral glume equalling the lower invol.-glume or slightly longer, 3-7-nerved, paleate, male or neuter (rarely 2-sexual); upper floral glume much shorter than the lower one, thin, 2-sexual (or sometimes? female), entire or minutely 2-fid, 3-7-nerved, awnless or 1-3-awned (if 3-awned, the 2 lateral awns bristle-like, straight, the median awn geniculate) Paleæ of floral glumes linear or oblong, 2-keeled; flaps more or less auricled. Lodicules 2, minute. Stamens 3; anthers linear-oblong. Styles 2, distinct; stigmas short, laterally exerted. Grain oblong to ellipsoid, free within the upper floral glume and palea.—Distrib. Species about 25, mainly in Tropical Asia and America.

Upper floral glume with 3 awns

Le ives less than 4 in long, annuals

A weak straggling grass, leaves glabrous or sparsely
harry, arrieled and pectimately cluate at the base, ' '
lateral awns from a triangular base ... ' il. A arenacea

An erect grass; leaves hispid with bulbous-based buirs,	
rounded at the base; lateral awns acicular	2. A. tuberculata.
Leaves 6-12 in, long; a perennial grass	3. A. selosa.
Awn of upper floral glumo solitary.	4. A. tenella.
Spikelets 1 - 1 in, long (smallest of the genus)	A. A. tenetia.
Plant scarcely 6 in. high; leaves 1-14 in. long	5. A, pygmæa.
Plants exceeding 6 in. high.	
Annuals.	
Stems reaching 1\frac{1}{2} ft. high; leaves 1-4 in. long and as well as the sheaths clothed with long soft hairs.	C 4 amm. 4523
Stems reaching 3 ft. high; leaves 4-6 in. long and	6. A. agrostoides,
as well as the sheaths glabrous or nearly so	7. A. Metzii.
Perennial; stem reaching 4 ft. high; leaves 8-12 in.	
long, sparsely hairy; sheaths glabrous or nearly so,	0
auricled at the mouth	8. A. Lawii.
Spikelets 1-1 in, long. Paniele branched; leaves 6-12 in, long.	*
Rootstock hard, creeping, not tuberous; panielo pyra-	
midal or thyrsiform; rhachis angular, glabrous	9. A. brasiliensis.
Rootstock tuberous; panicle oblong; rhachis filiform,	
scabernious	
Panicle spicate; leaves 1-11 in. long	11. А. гриши.
12-24 in, long	12. A. gigantea.

1. Arundinella arenacea, Munro, ev Thw. Enum. Pl. Zeyl. (1864) p. 362. An annual weak straggling slender grass; stems ascending, leafy, 6-12 in. long, rooting at the lower nodes; nodes glabrous. Leaves $\frac{3}{4}$ -2 by $\frac{1}{4}$ - $\frac{3}{6}$ in., ovate-lanceolate, acute, flat, glabrous or sparsely hairy, strongly nerved, from an amplexicaul pectinately ciliate 2-auricled base; sheaths glabrous, the margins naked or ciliolate in the upper part; ligule linear, small, membranous. Panicle 1-1 in. long, ovoid-oblong, compact; branches very short. Spikelets i in. long (excluding the awns). Glumes 4; invol.-glumes distant at the base, 3-5-nerved, membranous; lower invol.-glume & in. long (including awn), lanceolate, acute, narrowed into a scaberulous awn; upper invol.-glume rather longer, notched at the tip, with a long scaberulous awn in the sinus; lower floral glume shorter than the upper invol.-glume, oblong, obtuse, dorsally mucronate, paleate, neuter or male, the palea oblong-obovate, 2-fid at the apex; upper floral glume 2-sexual or female, shorter than the upper invol. glume, oblong, membranous, with 2 lateral tufts of white hairs, divided at the apex into 2 triangular lobes from each of which slender capillary awns issue; median awn about 3 in, long, the lower half brown, twisted, the upper half geniculate, pale; scabrid, subulate; palea linear-oblong, 2-fid at the apex. Fl. B. I. v. 7, p. 69; Trim. Fl. Ceyl. v. 5, p. 176; Woodr, in Journ, Bomb, Nat. v. 13 (1901) p. 434. Arundinella Campbelliana, Lisboa, in Journ. Bomb. Nat. v. 5 (1891) p. 346.—Flowers: Oct.

Dalzell without locality in Herb. Kew. Konkan: Ratnagiri, Woodrow. Deccas: Mahableshwar, Lisboa; Tiger Leap near Lanoli, Woodrow! S. M. Countay: Raim Ghat, Ritchie, 890!; Castlerock, Woodrow.—Distrib. India (Khasia, Birma, W. Peninsula); Coylon.

2. Arundinella tuberculata, Munro, ex Lisboa, in Journ. Bomb. Nat. v. 5 (1891) p. 344. Annual; stem erect or slightly decumbent at the base, 12-18 in. high, glabrous. Leaves 1-3½ by ½-½ in., linear-

lanceolate, acute, hi-pid with white bulbous-based hairs, base rounded: sheaths reaching 2 in. long, hispid with long white bulbous-based hairs; ligule a ridge of hairs. Paniele 3-6 in. long, narrowly oblong; rhachis angular; branches \(\frac{1}{4}-1\) in. long, scaberulous. Spikelets ovoid, acute, pedicellate, single or geminate, in. long (excluding awns), clothed with long bulbous-based hairs. Glumes 4; lower invol.-glume in. long (including an awn of about 15 in. long), 3-nerved, with bulbous-based hairs along the nerves, subcoriaceous; upper invol.-glume in. long (excluding the beak), ovate, acute, 5-nerved, with bulbous-based hairs along the nerves, narrowed into a beak as long as the body of the glume, subcoriaceous; lower floral glume rather more than \(\frac{1}{2} \) in. long, elliptic-oblong, obtuse, 2-fid, glabrous, subcoriaceous, with incurved margins, paleate, male, the palea as long as the glume, oblong-lanceolate acute; upper floral glume rather more than $J_{\bar{n}}$ in, long, lanceolate, acute, when ripe subcrustaceous, brown and scabrid; median awn reaching in. long, the lower half brown, twisted or not, the upper half straight, whitish, scaberulous; lateral awns acicular, transparent, $\frac{1}{12}$ - $\frac{1}{10}$ in. long. Fl. B. I. v. 7, p. 69; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434.—Flowers: Oct.

Dalzell without locality in Herb. Kow. Konkan: Stocks! Deccan: Poona, Woodrow.-Distrib. Central India.

3. Arundinella setosa, Trin. Gram. Panic. (1826) p. 63. Perennial; stem 1-3 ft. high, erect from a hard rootstock, slender, rigid. subtuberous at the base; nodes glabrous. Leaves 6-12 by $\frac{1}{8}$ in., linear, finely acuminate, glabrous, pubescent or sometimes hispidly hairy; sheaths glubrous; ligule very small. Panicle 3-10 in. long, lax; branches 2-5 in. long, distant, subcreet, filiform. Spikelets (including the mucro of the upper invol.-glume) reaching in. long (or more). Glumes 4; lower invol.-glume 1 in. long, ovate-lanceolate, aristately acuminate, 3-nerved, hairy or almost glabrous; upper invol.-glume rather more than 4 in. long, oblong-lanceolate, narrowed into a long awn with truncate tip, 5-nerved; lower floral glume 1 in. long, obtuse, paleate, male, the palea ? in. long, oblong-lanceolate, subacute; upper floral glume ? in. long, ovate-lanceolate, acuminate, 2-sexual; palea as long as the glume, narrowly oblong-lanceolate, subacute; median awn more than 1 in. long, brown below, pale above; lateral awns capitlary, 10 in. long. Fl. B. I. v. 7, p. 70; Trim. Fl. Ceyl. v. 5, p. 177; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1215.

KONKAN: near Bombay, Ritchie!—Distrib. India (W. Himalaya, Khasia Hills, Central India); Ceylon, Tonkin, China, Philippines.

4. Arundinella tenella, Nees & Wight, ex Stend. Nom. ed. 2, part 1 (1840) p. 143. Annual, nearly glabrous; stems solitary or tufted, erect, glabrous or with a few scattered hairs. Leaves 1-3 by \(\frac{1}{4}\)-\(\frac{3}{4}\) in., ovate to linear-lanceolate, acuminate, membranous, many-nerved, sprinkled with a few slender soft hairs, base narrowed; sheaths usually glabrous with ciliate margins. Panicle 2-10 in. long, effuse, copiously branched; rhachis slender, strict, erect; branches alternate or the lower subverticillately fascicled, each with widely spreading capillary branches and branchlets. Spikelets the smallest of the genus, \(\frac{1}{4}\)-\(\frac{1}{2}\) in. long; pedicels long, slender. Glumes 4; lower invol.-glume \(\frac{2}{2}\)0 for \(\frac{1}{2}\)0 in. long, ovate-lanceolate, acute, thinly membranous, 3-nerved; upper invol.-

glume longer, $\frac{1}{10}$ – $\frac{1}{12}$ in. long, ovate-lanceolate, cuspidately acuminate, 5-nerved; lower floral glume $\frac{1}{26}$ in. long, ovate, obtuse, paleate; upper floral glume $\frac{1}{26}$ in. long, lanceolate, scabrid above; awn solitary, about $\frac{1}{10}$ in. long, the lower part brown, slightly twisted, the upper part pale. Fl. B. I. v. 7, p. 71; Dalz. & Gibs. p. 292; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1215. Arandinella pumila, Steud. Syn. Pl. Gram. (1855) p. 114; Lisboa, in Journ. Bomb. Nat. v. 5 (1891) p. 345.—Flowers: Nov.

Bombry, Lambert! Decean: Karli and Khandala, Jacquemont, 631!; Lanoli, Woodrow; Mahableshwar, common under the shade of trees, Dalzell!, Cooke!, Woodrow, Lisboa.—Distrib. India (W. Himalaya, Bebar, Central India, Khasia Hills W. Peninsula). Abjesinia.

5. Arundinella pygmæa, Hook. f. Fl. B. I. v. 7 (1896) p. 72. A small slender plant scarcely 6 in. high; stem very slender. Leaves chiefly radical, 1-1½ by ¼0 in., linear-lanceolate, nerveless except the strong midrib, with a few scattered long hairs and finely serrulate margins; sheaths glabrons. Panicle erect, effuse; rhachis filiform; branches few, capillary. Spikelets ¼ in. long (including the cuspidation of the upper invol.-glume), ovoid-lanceolate, hispidly hairy; pedicels very long, capillary. Glumes 4; lower invol.-glume ¼ in. long, ovate, 3-nerved, hispid with long hairs; upper invol.-glume ¼ in. long, ovate-lanceolate, cuspidately acuminate, 5-nerved, hispid with long hairs; lower floral glume ¼ in. long, ovate, obtuse, coriaceous, with incurved margins, obscurely 5-nerved; upper floral glume about ¼5 in. long, elliptic-oblong; awn solitary, ¼-⅓ in. long, the lower half brown, the upper half pale. Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434.— Flowers: Sept.

KONKAN: crest of W. Ghats, Woodrow. KANARA: N. Kanara, Lisboa. There is only one half sheet of very poor specimens in Herb. Kew., collected in N. Kanara by Dr. Lisboa.

6. Arundinella agrostoides, Trin. Sp. Gram. Icon. v. 3 (1836) t. 265. Annual; stem 8-18 in. long, stout or slender. Leaves 1-1 by \(\frac{1}{4}-\frac{1}{2}\) in., flat, narrowed to the base, clothed with long soft hairs; sheaths softly hairy; ligule a ridge of hairs. Panicle 1-8 in. long, contracted; branches fascicled, suberect. Spikelets \(\frac{1}{10}-\frac{1}{6}\) in. long, ovoid-lanceolate, the lower half usually bristly; pedicels reaching \(\frac{1}{8}\) in. long, slender, glabrous or nearly so. Glumes 4; lower invol.-glume ovate, acuminate, 3-nerved, usually with a few bristles on the lower half; upper invol.-glume \(\frac{1}{8}\) in. long, ovate, cuspidately acuminate, 5-nerved; lower floral glume rather more than \(\frac{1}{10}\) in. long, ovate-lanceolate, coriaceous, paleate, 3-nerved, the palea ovate-lanceolate, acuminate; upper floral glume about \(\frac{1}{20}\) in. long, elliptic, obtuse, usually female; palea oblong, obtuse; median awn reaching \(\frac{1}{6}\) in. long, the lower half twisted, brown, the upper half pale, geniculate above the twisted column; lateral awns 0. Fl. B. I. v. 7, p. 71; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434.

Konkan: Wight,

I have seen no specimens from Bombay. Woodrow includes the plant in his list of grasses in the 'Journal of the Bombay Natural History Society,' but does not appear to have collected it, as he gives no habitat.

7. Arundinella Metzii, Hochst. in Miq. Anal. Bot. Ind. part 2 (1851) p. 19. Annual, 1-3 it. high; stems stender, erect. Leaves 4-6 by $\frac{1}{4} - \frac{1}{3}$ in., linear, glabrous or sparsely hairy; sheaths glabrous or sparsely hairy. Panicle 1-8 in. long, effuse; rhachis slender, smooth or subscaberulous; branches elongate, alternate or fascicled, 1-4 in. long. Spikelets $\frac{1}{5}$ in. long, ovoid-lanceolate. Glumes 4; lower invol.-glume $\frac{1}{10}$ in. long, ovate-lanceolate, with a slender mucro about $\frac{1}{30}$ in. long, strongly 3-nerved; upper invol.-glume $\frac{1}{5}$ in. long, similar, with a mucro about $\frac{1}{30}$ in. long, 5-nerved; lower floral glume elliptic, obtuse, $\frac{1}{10}$ in. long, 3-nerved, paleate, empty or male, the palea $\frac{1}{10}$ in. long, ovate, obtuse; palea as long as the glume, linear-lanceolate, subobtuse; awn solitary, $\frac{1}{5}$ in. long, the lower half brown, the upper pale. Fl. B. I. v. 7, p. 72; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 434.—Flowers: Oct.

DECCAN: Lanoli, Woodrow. KANARA: Thomson!-Distrib. India (W. Peninsula).

8. Arundinella Lawii, Hook. f. in Trim. Fl. Ceyl. v. 5 (1900) p. 180. Perennial; stems tufted, erect, 2-4 ft. high, leafy, smooth; nodes hairy. Leaves 8-12 by 1 in., linear, finely acuminate, flat, sparsely hairy, with nearly smooth margins; sheaths elongate, glabrous or nearly so, auricled and ciliate at the mouth; ligule a tomentose lunate ridge. Panicle 12-20 in. long., pyramidal, decompound, effuse, drooping; rhachis slender, smooth; lower branches reaching 6 in. long, in distant fascicles, filiform, spreading, flexuous; branchlets capillary. Spikelets numerous, usually hairy, rather more than In in. long (excluding the awns); pedicels very long. Glumes 4; lower invol.-glume about 13 in. long (including a short slender awn about 10 in. long), lanceolate, acute, 3-nerved, hairy on the nerves, thinly membranous; upper invol.-glume similar to the lower but longer (nearly \frac{1}{5} in. long, including an awn of nearly 10 in. long), 5-nerved, hairy on the nerves, think membranous; lower floral glume rather less than in long, shorter than the upper invol.-glume, oblong, subobtuse, faintly 5-nerved, not awned, hyaline, paleate, the palea narrowly oblong, subobtuse with a faint median nerve; upper floral glume \(\frac{1}{20} - \frac{1}{10}\) in. long, elliptic-lanceolate, acute, hyaline, usually 3-nerved, with incurved margins and a long filiform awn reaching 3 in. long, 2-sexual. Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435. Arundinella agrostoides, Hook. f. Fl. B. I. v. 7 (1896) p. 71 (partly).

Konkan: Woodrow, 35!; N. & S. Konkan, Law! - Distrib. India (W. Peninsula); Coylon.

9. Arundinella brasiliensis, Raddi, Agrost. Bras. (1823) p. 37, t. 1, fig. 3. Perennial; rootstock stout, hard, creeping and sending out stout sheathed branches sometimes as thick as a goose-quill, or tufted and intricately branched; stems 1-5 ft. long, stout or slender, simple or branched, hairy or almost glabrous; nodes glabrous or pubescent. Leaves 6-12 by $\frac{1}{6}-\frac{3}{3}$ in., usually ciliate at the narrow base, glabrous or hairy; sheaths usually glabrous; ligule a minute ridge fringed with long hairs. Panicle pyramidal, thyrsiform or subcorymbose, 4-18 in. long; rhachis angular, usually glabrous; branches 1-10 in. long, few or many, fasciculate or subverticillate. Spikelets $\frac{1}{6}-\frac{1}{6}$ in. long, subsecund, pedicellate, ovoid-lanceolate, usually glabrous. Glumes 4; lower invol.-

glume 1 in. long, ovate-lanceolate, acuminate, subacute, 3-nerved. glabrous or (rarely) sparingly setose; upper invol.-glume 1 in. long, ovate-lanceolate, acuminate, 5-nerved; lower floral glume & in. long. elliptic-oblong, obtuse or shortly 2-fid, 3-5-nerved, palente, empty or male, the palea 1 in. long, lanceolate, hyaline; upper floral glume less than in long, bearded at the base, narrowly ovate-lanceolate, scabernlous, 2-sexual; awn ; in. long, straight or slightly twisted, brown below, pale above; palea narrowly lanceolate, acute, as long as the glume. A very variable plant. The measurements have been taken from specimens with full-sized spikelets. A. Ritchici, Munro, has smaller glumes and spikelets. The inflorescence of the Indian plant is generally more lax than that of the Brazilian, and the spikelets somewhat larger. Fl. B. I. v. 7, p. 73; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435; Prain, Beng. Pl. p. 1215. Arundinella striata, Nees, in Kew Journ. Bot. v. 2 (1850) p. 102; Dala. & Gibs. p. 293, A. nepaleasis, Trin. Gram. Panic. (1826) p. 62; Lisboa, in Journ. Bomb. Nat. v. 5 (1891) p. 313. A. Ritchiei, Munro, ex Lisboa, in Journ. Bomb. Nat. l. c .- Flowers : Oct.

Decen: Mahableshwar, Datzell of Gibson, Lisboa; Panchgani, Woodrow; Lanoli, Lisboa; Khandala, Lisboa. Kanara: N. Kanara, Lisboa.—Distair. Throughout the hilly parts of India; China, Malaya, Australia, Tropical America.

10. Arundinella capillaris, Hook. f. Fl. B. I. v. 7 (1896) p. 74. Perennial, very slender; stem erect from a tuberous rhizome which is clothed with the woolly bases of leaf-sheaths; nodes glabrous. 6-12 by \(\frac{1}{2}\)-\frac{1}{3}\) in., linear, acuminate, glabrous or hairy; sheaths glabrous, striate; ligule a ridge of hairs. Panicle oblong, 5-7 in. long; rhachis filiform, scaberulous; branches alternate, slender, 4-6 in. long. lets 1-1 in. long, glabrous, solitary or geminate; pedicels long, capillary, angular. Glumes 4; lower invol.-glume 1 in. long, ovate, acute, with a long slender mucro, 3-nerved, with a scaberulous keel; upper involglume reaching 1 in. long, ovate-lanceolate, narrowed into a subcuspidate acuminate tip, 5-nerved; lower floral glume rather more than 1 in long, ovate-oblong, subacute, 3-nerved, paleate, the palea 1 in. long, oblonglanceolate, acute, hyaline; upper floral glume 1 in. long, lanceolate, acute, slightly scabrid; palea oblong-lanceolate, acute; awn nearly + in. long, geniculate about the middle, easily breaking off. Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435. Arundinella mutica, Nees, ex Steud. Syn. Gram. (1855) p. 116.—Flowers: Oct.

Konkan: Parel near Bombay, Woodrow. Kanara: Kála naddi, Woodrow.— Distrib. India (W. Peninsula).

11. Arundinella spicata, Dalz. in Dalz. & Gibs. Bo. Fl. (1861) p. 293. A small grass in appearance resembling a Sctaria; stem 6-12 in. high, erect, simple. Leaves 1-1½ by ¼ in., linear-lanceolate, acute, densely hispid with long hairs; sheaths densely hispid; ligule a minute hairy ring. Inflorescence of cylindric racemes ?-2 in. long. Spikelets ¼ in. long to top of upper invol.-glume: pedicels very short. Glumes 4; lower invol.-glume ¼ 12 in. long, lanceolate, acuminate, with a few long bulbous-based hairs, 3-nerved; upper invol.-glume reaching ¼ in. long, narrowly lanceolate, attenuated into a long acuminate point, folded round and completely concealing the upper floral glume and its awn,

3-nerved and with a few scattered long hairs; lower floral glume $\frac{1}{10}$ in. long, lanceolate, acute, thinly membranous, glabrous, paleate, empty or male, the palea $\frac{1}{10}$ in. long, lanceolate, acute; upper floral glume $\frac{1}{20}$ in. long, oblong, obtuse, female or 2-sexual; palea lanceolate, acute, hyaline; awn $\frac{1}{6}$ in. long, the lower half brown, the upper pale, geniculate about the middle. Fl. B. I. v. 7, p. 77; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435.—Flowers: Nov.

Decean: common on the Mahableshwar Hills, Dalzell & Gibson, Woodrow!, Cooke!—Distrib. India, Western Peninsula, apparently endemic.

12. Arundinella gigantea, Dalz. in Dalz. & Gibs. Bo. Fl. (1861) p. 293. A tall grass; stems erect, smooth, terete, 6 ft. high, as thick as a goose-quill at 18 in. below the panicle; nodes glabrous. Leaves 1-2 ft. by $\frac{7}{8}$ - $1\frac{1}{4}$ in., linear-lanceolate, finely acuminate, glabrous or sparsely hairy, many-nerved, base rounded or cordate; sheaths striate, sparsely hairy or almost glabrous; ligule a narrow glabrous membrane. Panicle subcorymbosely thyrsiform, 5-7 by 2-3 in.; rhachis stout, scabrid, angular, concealed by the numerous erect angular branches which are 2-4 in. long. Spikelets $\frac{1}{10}$ - $\frac{1}{8}$ in. long. Glumes 4; lower invol.glume 1 in. long, broadly ovate, acute, strongly 3-nerved, with a scaberulous keel; upper invol.-glume $\frac{1}{10} - \frac{1}{8}$ in. long, ovate, narrowed. into an acuminate point; 5-nerved; lower floral glume $\frac{1}{12}\frac{1}{10}$ in. long, ovate, subobtuse, 3-5-nerved, paleate, the palea 1 in. long, elliptic, hyaline; upper floral glume Is in. long, elliptic, thickly coriaceous, white, without an awn. Fl. B. I. v. 7, p. 76; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 435.—Flowers: Oct.

Konkan: Stocks!; Kineshvar below the Ghats, Dalzell of Gibson. S. M. Counter: Castlerock, Woodrow.—Distrin. India (W. Peninsula).

38. TRISTACHYA, Nees.

Perennial, usually coarse grasses. Leaves various. Spikelets 2-flowered (lower flower male, the upper 2-sexual), large, lanceolate to linear, sessile or shortly pedicellate, in clusters of 3 at the tips of the branchlets of a raceme or panicle; rhachilla not produced beyond the upper floret. Glumes 4; invol-glumes more or less unequal, not awned, persistent, 3-nerved, membranous or subcoriaceous; lower floral glume membranous or ultimately cartilaginous, 2-lobed, with a long twisted awn in the sinus (copiously bearded above the middle in the Indian species); palea hyaline, 2-keeled. Lodicules 2, cuneate, fleshy. Stamens 3. Styles slender; stigmas plumose, laterally exserted. Grain narrow, free.—Distrim. Africa, Arabia, India, Beluchistan, Tropical America; species 11-12.

1. Tristachya barbata, Nees, ex Steud. Syn. Pl. Gram. (1855) p. 238. Stem 6-18 in., branched and woody at the base, geniculately ascending, the base clothed with tomentose leaf-sheaths; nodes woolly. Leaves 1-3 by $\frac{1}{10} - \frac{1}{6}$ in., linear-lanceolate from a rounded base, finely acuminate, pungent, rigid, glaucous, many-nerved, with a subserrulate thickened margin. Panicle 1-2 in. long and nearly as broad, sparingly branched; branches solitary and 2-nate, capillary. Spikelets nearly $\frac{1}{2}$ in. long (excluding the awn); callus glabrous. Glumes 4;

lower invol.-glume $\frac{1}{2}$ in. long, ovate-lanceolate, subacute, 3-nerved; upper invol.-glume $\frac{1}{2}$ in. long, oblong-lanceolate, 3-nerved: lower floral glume nearly $\frac{1}{2}$ in. long, male, lanceolate, acuminate, interruptedly 7-nerved, with a linear-lanceolate palea $\frac{1}{2}$ in. long; upper floral glume $\frac{1}{2}$ in. long, 2-sexual, densely hairy on the back above the middle with very slender hairs nearly $\frac{1}{2}$ in. long, 2-lobed, the lobes lanceolate, acute, aristate, each lobe 3-nerved, $\frac{1}{2}$ in. long with an awn $\frac{5}{3}$ in. long from the sinus; palea lanceolate, acute, $\frac{1}{2}$ in. long. Fl. B. I. v. 7, p. 272; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 440. Tristachya Stocksii, Boiss. Fl. Orient, v. 5 (1881) p. 552.

SIND: Stocks, 1217! and 618! - DISTRIB. Arabia, Nubia.

39. THYSANOLÆNA, Necs.

A large glabrous reed-like grass; stems solid. Leaves broad, flat. Spikelets innumerable, very minute, 1-flowered, jointed on very short pedicels and subsecund on the very numerous crowded, long, filiform, compound, subsecut branches and branchlets which form a very large effuse pyramidal panicle; rhachilla produced but not beyond the floret. Glumes 4; invol.-glumes small, concave, awnless, faintly nerved or nerveless; lower floral glume rather longer than the upper, empty, acuminate, epaleate; upper floral glume ovate, acute, ciliate with long erect white hairs; palea short, truncate. Stamens 2-3; anthers short. Styles free. Grain very minute, free within the hardened glumes.— Distrib. Tropical Asia; species 1.

1. Thysanolæna Agrostis, Necs, in Elinb. N. Phil. Journ. v. 18 (1835) p. 180. A large handsome grass; stem 4-12 ft. high, reaching sometimes \frac{3}{8} in. in diam., glabrous, polished. Leaves very large, 1-2 ft. by 2-4 in., coriaceous, linear-lanceolate, tapering to a fine point, manyveined, base cordate; sheaths glabrous, striate, hairy at the mouth; ligule small, ciliate. Panicle large, 1-2 ft. long, soft, glabrous; branches very numerous, suberect, filiform, with many short branchlets carrying small spikelets. Spikelets 10-15 in. long, ovoid-lanceolate, acuminate, pedicellate; rhachilla produced into a linear-lanceolate point about x in. long. Glumes 4; invol.-glumes less than $\frac{1}{30}$ in. long, subequal, about $\frac{1}{2}$ as long as the floral glumes, ovate, subacute, hyaline, obscurely 1-nerved; lower floral glume longer than the upper, lanceolate, acuminate, membranous, glabrous, epaleate, empty, 1-nerved; upper floral glume ovatelanceolate, acuminate, ciliate with long white erect hairs. Fl. B. I. v. 7, p. 61; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 434; Prain, Beng. Pl. p. 1172. Thysanolæna acarifera, Arn. & Nees, in Nov. Act. Cur. v. 19, Suppl. 1 (1843) p. 181; Duthie, Fold. Grass. N. Ind. (1888) p. 21; Watt, Dict. Econ. Prod. v. 6, part 4, p. 48.—Flowers: Jan. Venn. Barucha,

Konkan: Thana, Lisboa. Duccan: Khandesh, Lisboa; Dangs, Woodrow; Nasik, Lisboa. Gujarat: Bansda (Surat districts), Woodrow.—Distrib. Throughout India; Penang, castwards to New Guinea.

40. PHRAGMITES, Trin. (ex parte).

Tall perennials with a creeping rhizome; stem stout, hollow, leafy upwards. Leaves long, flat. Panicle lax, usually very large and

decompound. Spikelets conspicuously silky from the long hairs on the callus, loosely 3-10-flowered, awnless; rhachilla disarticulating above the lower and between the following floral glumes, slender, penicillate with long hairs, not produced beyond the flowering glumes. Glumes glabrous; invol.-glumes unequal, oblong-lanceolate, acute, 3-nerved, membranous, persistent: floral glumes heteromorphous, the lowest linear-lanceolate, much exceeding the invol.-glumes, the following very thin, more or less caudate-acuminate, hyaline, 3-nerved; callus long, slender, densely clothed with very long silky bairs. Paleae linear-oblong, about ½ as long as their glumes, 2-keeled. Lodicules 2 (sometimes 3 in the lower floret). Stamens 3 (sometimes 2 in the lower floret). Stamens 3 (sometimes 2 in the lower floret). Styles 2, distinct, rather short; stigmas laterally exserted, densely plumose. Grain oblong, semiterete.—Distrib. Species 2 (perhaps reducible to 1), almost cosmopolitan.

1. Phragmites karka, Trin. ex Steud. Nom. ed. 2, part 2 (1841) p. 324. Stems reaching 10 ft. high, smooth, simple or branched, covered with the leaf-sheaths. Leaves close, bifarious, linear, acuminate, reaching 1} in. broad, coriaceous, smooth, base contracted, margins smooth; sheaths loose, glabrous, the mouth nuricled; ligule a ciliate line. Paniele 1-2 ft. long, erect, oblong; branches widely spreading, filiform. Spikelets when fully expanded about 1 in. broad across the glumes: pedicels capillary, smooth; callus densely clothed with long silky hairs. Glumes glabrous; lower invol.-glume & in. long, oblong-lanceolate, acute, 3-nerved: upper invol.-glume rather less than & in. long, oblonglanceolate, acute, 3-nerved; lower floral glumo less than 1 in. long; upper floral glume rather longer than the lower; palea 10 in. long, linear-oblong. Authors 1 in. long. Fl. B. I. v. 7, p. 303; Trim. Fl. Ceyl. v. 5, p. 287; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 440; Prain, Beng. Pl. p. 1218. Phragmites Roxburghii, Steud. Nom. ed. 2, part 2 (1841) p. 324; Watt, Diet. Econ. Prod. v. 6, part 1, p. 216.

Not common in the Bombay Presidency. Discus: Dhond Lisboa ex Woodrow. Sisn: Starks, 1211!—Discuss. More or less throughout India; Tropical Asia, Afghanistan, Japan, Africa, Australia.

Woodrow in his list (Journ. Bomb. Nat.) gives P. communis as grown in gardens under the name of Gardener's Garter, but the Gardener's Garter which is commonly

grown is Phalaris arundinacea var. variegata.

41. ARISTIDA, Linn.

Annual or perennial tufted grasses. Leaves flat or convolute. Spikelets panieled, 1-flowered, not articulate on their pedicels, laterally compressed; rhachilla not produced beyond the flowering glume. (flumes 3; invol.-glumes very narrow, long, 1-nerved, keeled, persistent, with or without a terminal awn; floral glume very narrow, cylindric, corinecous, 3-nerved, tipped by 3 very long capillary awns (the 2 lateral awns occasionally short or obsolete); callus long, articulate at the base; palea minute, convolute round the ovary and grain. Lodicules 2, long, narrow, hyaline. Stamens 3; anthers long, narrow. Styles free, short; stigmas penicillate, laterally exserted. Grain long, narrow, cylindric, free in the convolute closely enveloping glume.—Distrain. Species about 100, in warm countries.

Awns not articulate on the floral glume, tripartite from the	
base without a column.	,
Invol. glumes not awned	1. A. Adscenscionis.
Involglumes awaed.	ar an anactrocionis.
Awns of involglumes ! in long: spikelets ! in long.	2. A. sefacea.
Awns of involglumes 1's in. long; spikelets I in. long.	3. A. Hustri.e.
Awns with a twisted column.	• •
Column of awas articulate on the floral glume.	
Awn plumose	4. A. hirtigluma.
Awn not plumose.	
Stems less than 6 in. high; lower involglume ; in.	
long	5 A hustricula
Stems reaching 2 ft. high; lower involglume I in, long.	 A. hystricula. A. funiculata.
Odinar of awas not traly articulate on the floral duma	o. 1. janaanaa,
Column of awas not truly articulate on the floral glume, though readily separating; lower involglume } in.	
fundin teaming sobstained; lower involvations 3 m.	
long	7. A. redacta.

1. Aristida Adscenscionis, Linn. Sp. Pl. (1753) p. 82. Annual or perennial; stems 9-24 in. long, densely tufted, very slender, erect or ascending, simple or branched; branches erect, smooth. Leaves. 3-12 by 15-17 in., convolute, filiform, smooth or scaberulous; sheaths smooth, with rounded auricles; ligule of fine short hairs. Panicle 3-12 in. long, contracted, subsecund; rhachis filiform, smooth; branches short; pedicels short, capillary. Spikelets erect, 1-1 in. long. Lower invol.-glume in long, oblong-lanceolate, acute, membranous, often purple, with a scaberulous keel; upper invol.-glume lanceolate, in. long, 2-toothed and apiculate at the tip, the keels smooth; floral glume in. long, 3-nerved, smooth; awns 3, not articulate on the glume, the middle one larger than the lateral, 3-3 in. long; callus long, pointed, hairy at the base : palea minute, oblong, hyaline, retuse. Fl. B. I. v. 7. p. 224; Trim. Fl. Cevl. v. 5, p. 252; Woode, in Journ. Bomb. Nat. v. 13 (1901) p. 439; Prain, Beng. Pl. p. 1211. Aristida depressa, Retz. Obs. fasc. 4 (1786) p. 22; Dalz. & Gibs. p. 295; Watt. Diet. Econ. Prod. v. 1, p. 312,—Flowers: Oct.-May.

On dry hills, Dalzell & Gibson. Decean: Poona, Cooke!, Woodrow; Bowdhan hill near Poona, Woodrow, 38! Gidarat: Jetalsar (Kathiawar), Woodrow, 43!—Distrim. Throughout the plains and low hills of India; Ceylon, most warm countries. A trouble-some grass for those who have to walk through a patch of it; the ripe spikelets, which are easily detached, are like burbed arrows.

2. Aristida setacea, Retz. Obs. fasc. 4 (1786) p. 22. Perennial; stem 2-3 ft. high, stout, erect or geniculately ascending from a woody base, with stout wiry root-fibres, hard, smooth and polished, simple or subfastigiately branched. Leaves 6-12 by $\frac{1}{12}\frac{1}{6}$ in., usually convolute, coriaccous, smooth; sheaths long, smooth; ligule of short hairs. Paniele various, 6-12 in. long, inclined, sometimes subsecand, open or contracted; rhachis slender, smooth; branches long or short, the lower sometimes reaching 4 in. long, filiform or capillary, usually fascicled and erect. Spikelets $\frac{5}{6}$ in. long (excluding awns), erect; pedicels capillary. Lower invol.-glume awned, $\frac{5}{6}$ in. long (including an awn of $\frac{1}{6}$ in. long), 1-nerved; upper invol.-glume a little longer than the lower (with an awn about $\frac{1}{6}$ in. long), notched at the insertion of the awn, and with hyaline margins, 1-nerved; floral glume $\frac{5}{6}$ in. long, 3-nerved; awns 3, inarticulate at the base, 1-1 $\frac{1}{6}$ in. long, subequal or the middle the longest; callus long, bearded with long hairs. Stamens 3; anthers

in. long. Fl. B. I. v. 7, p. 225; Grah. Cat. p. 235; Dalz. & Gibs. p. 295; Trim. Fl. Ceyl. v. 5, p. 253; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 439; Prain, Beng. Pl. p. 1211; Watt, Dict. Econ. Prod. v. 1, p. 312.

KONAAN. Stocks!; Salsette, Graham. Deccan: Khandala, Graham. Gujarat: Rajkot (Kathiawar), Woodrow.—Distrib. India (W. Peninsula, Behar), Ceylon, Mascarene Islands.

The grass is largely used for making the screens known as "tatties."

- 3. Aristida Hystrix, Linn. f. Suppl. (1781) p. 113. Perennial; stems 6-24 in. long, from a creeping rootstock, diffuse, ascending, sometimes proliferously branched. Leaves rather glaucous, $1\frac{1}{2}$ -4 by $7\frac{1}{6}$ - $\frac{1}{6}$ in., convolute; sheaths glabrous, striate; ligule of soft hairs. Panicle 4-6 in. long and as broad as long, rigid; rhachis stout, flexuous and angular; branches and branchlets smooth. Spikelets (excluding awns) $\frac{1}{8}$ in. long, straw-colored. Lower invol.-glume $\frac{3}{8}$ in. long (including awn), lanceolate, acuminate, 1-nerved, with an awn of $\frac{1}{16}$ in. long, chartaceous; upper invol.-glume more than $\frac{1}{2}$ in. long (including an awn of $\frac{1}{16}$ in. long), lanceolate, acuminate, chartaceous, 1-nerved, quite glabrous, minutely toothed at the tip at the base of the awn; floral glume $\frac{3}{8}$ in. long; callus $\frac{1}{16}$ in. long, pointed, shortly villous; awns 3, not articulate with the glume, subequal or the middle one sometimes the longest, scabrid. Fl. B. I. v. 7, p. 225; Grah. Cat. p. 235; Dalz. & Gibs. p. 295; Woodr. in Journ Bomb. Nat. v. 13 (1901) p. 439.—Flowers: Oct.
- S M Country Budami, Cooke', Woodrow.—Distrib India (Central Provinces, W. Peninsula).
- 4. Aristida hirtigluma, Steud. Nom. ed. 2 (1840) part 1, p. 131, et Syn. Gram. (1855) p. 144. Perennial; stems tufted, 1-2 ft. high, smooth, glabrous, terete, shining; nodes glabrous. Leaves 2-6 in. long, reaching $\frac{1}{\sqrt{0}}$ in. broad when opened out, convolute, filitorm with capillary tips; shearhs quite glabrous except for a few long hairs at the mouth, close; ligule a very narrow densely ciliate membrane. Panicle slender; branches short, erect, capillary. Spikelets pale green or straw-colored, linear-lanceolate. Lower invol.-glume $\frac{1}{3}$ in long, linear-oblong, acute, scarious; upper invol.-glume a little longer, but similar; floral glume slightly muricate; callus about $\frac{1}{30}$ in. long, pointed, shortly villous; column of aw $\frac{1}{100}$ in long, plumose with long slender hairs, articulated on the glume; middle branch $\frac{1}{2}$ in. long or more, plumose in the lower half with long delicate hairs; lateral branches very slender, hair-like, about $\frac{1}{2}$ in. long, not plumose. Fl. B. I. v. 7, p. 227; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 439.—Flowers: Aug.

Sinn Dalzell!; hill near Bullo Khan, Woodrow, 2001-Distrib. India (Panjáb, Peshawar, Sind); Egipt, Abyssima.

5. Aristida hystricula, Edgew. in Journ. Linn. Soc. v. 6 (1862) p. 208. Annual, dwarf, slender, about 1-3 in. high, pale; stems many from the root, \(\frac{1}{2}\)-1 in. high, densely crowded; nodes glabrous. Leaves subulate, curved, convolute, acuminate, glabrous, less than 1 in. long; sheaths glabrous; ligule a small line of hairs. Panicle without the awns \(\frac{1}{2}\)-1 in. long, shorter than the awns, narrow, few-flowered; vol. II.

branches few, short, erect. Spikelets $\frac{3}{6}$ in, long or more. Lower involglume $\frac{1}{6}-\frac{1}{6}$ in, long, much shorter than the upper, ovate lanceolate, acute, apiculate, scarious; upper invol.-glume $\frac{3}{6}$ in, long, linear, running out into a slender awn or often cleft at the tip into 2 subulate lobes r_{10}^{1} in, long; lower floral glume $\frac{1}{6}$ in, long; column of awn $\frac{1}{2}$ in, long, twisted, the 3 branches subequal, extremely slender, $\frac{1}{2}-\frac{3}{4}$ in, long. Fl. B. I. v. 7, p. 227; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 439.

Sind: Jemadar ka Lunda near Karachi, Stocks, 1187!—Distain, India (Panjah, Sind); Beluchistan.

6. Aristida funiculata, Trin. & Rupr. in Mém. Acad. Pétersb. sér. 6, v. 7 (1849) p. 159. Annual; very slender; stems 10-24 in. long, many, geniculately ascending. Leaves 2-6 by \(\frac{1}{20}\) \(\frac{1}{12}\) in., convolute or flat, ciliate at the base; sheaths glabrous; ligule a small ciliate membrane. Panicle 4-10 in. long, lax, narrow; rhachis angular; branches short, erect, capillary. Spikelets variable in length, \(\frac{1}{2-3}\) in. long. Lower invol.-glume reaching \(\frac{3}{3}\) in. long, linear-lanceolate, acute, 1-nerved, tapering into a slender awn; upper invol.-glume somewhat shorter than the lower, similar in shape and similarly awned; floral glume small, smooth, awned; awn articulate on the glume, the column \(\frac{1}{2-3}\) in. long, twisted, with 3 capillary branches of which the middle is the longest, reaching 1\(\frac{1}{2}\) in. long. Fl. B. I. v. 7, p. 226; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 439. Aristida Roylcana, Trin. & Rupr. in Mém. Acad. Pétersb. sér. 6, v. 7 (1849) p. 160; Lisboa, in Journ. Bomb. Nat. v. 7 (1893) p. 358.—Flowers: Oct.

Decean: Poona, Lisbea; Sattara, Lisbea; Sholapur, Lisbea; Dapuri near Poona; Jacquemont, 489! S. M. Country: Belgaum, Woodrow. Sind: Jam village, Woodrow, 19!—Distrim. India (Panjáb, Rajputana, W. Peninsula); Beluchistan, Arabia, Tropical Africa.

7. Aristida redacta, Stapf, in Kew Bullet. (1892) p. 85. Annual or sometimes perennial (and then more robust); stems tufted, 6-24 in. high, simple, or proliferously branched in robust specimens; nodes glabrous. Leaves 4-6 in. long, very slender, convolute, hairy above, smooth below, margins rough; sheaths glabrous; ligule narrow, shortly and densely ciliate. Panicle 9-10 in. long by 7½ in. broad; branches usually twin, remote, at length spreading; pedicels unequal, shorter than the glumes. Spikelets on long or short capillary pedicels, green or purplish. Lower invol.-glumes subequal, narrowly lanceolate, linely acuminate, shortly aristate, reaching ½ in. long; floral glume with a hairy callus, usually purplish, armed with an awn 1½ in. long; column of awn capillary, twisted, easily separating from the glume but not truly articulate; branches 3 from the top of the column, the lateral much shorter than the middle one, sometimes 0. Fl. B. I. v. 7, p. 227; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 439. Stipa aristoides, Stapf, ex Lisboa, in Journ. Bomb. Nat. v. 7 (1893) p. 358; Prain, Beng. Pl. p. 1211.—Flowers: Oct.

Lisboa without locality in Herb. Kew. 5!; Woodrow without locality, 19! Decean: Woodrow, 124!, Lisboa; Lanoli, Woodrow; Junnar (Poona districts), Woodrow. S. M. Country: Dharwar, Tulbot; 2910! Kanar: Law!—Distrib. India (Central India, Nagpur, W. Bengal, W. Poningula) · S. Persia

42. HELEOCHLOA, Host.

Rigid annual or perennial erect or prostrate grasses. Leaves flat or convolute. Spikelets 1-flowered, densely imbricate, in cylindric spikelike panicles laterally compressed; rhachilla not produced beyond the floral glume. Glumes 3, scarious, the invol.-glumes subequal or the lower shorter, keeled, 1-nerved, persistent; floral glume equalling the upper invol.-glume or longer, ovate or oblong, loosely 1-nerved, envrapping the grain, membranous; palea oblong, obtuse or 2-fid, 2-nerved. Lodicules 2. Stamens 2 or 3. Styles elongate. Grain ovoid or ellipsoid, loose in the glume and palea.—Distrib. Species few, Oriental.

Annual, stems prostrate; panicles less than 1 in. long; filaments of anthers not thickened at the base; a herb of dry ground

Percannal; stems erect or ascending; panicles reaching 31 in. long; filaments of anthers thickened at the base; a herb

of salt-water creeks.....

1. H. schanoides,

2. H. dura.

1. Heleochloa scheenoides, Host, Gram. v. 1 (1801) p. 23, t. 30. Annual; stems prostrate, spreading in a circle round the root, 1-6 in. long, glabrous, smooth, more or less striate, rigid; nodes glabrous. Leaves 1-2 in. long, narrowly lanceolate, acuminate; sheaths more or less inflated, ribbed, hairy at the mouth and with membranous (sometimes ciliate) margins; ligule a dense ring of long slender hairs. Inflorescence a spike-like ovoid-oblong, compressed panicle 1-3 in. long, sessile on the greatly dilated sheath of the uppermost leaf. Spikelets densely imbricate, in in. long. Glumes 3; lower invol.-glume in. long, linear-lanceolate, folded, glabrous except for the ciliate keel, scarious, 1-nerved; upper invol.-glumo a little longer than the lower, ovate-lanceolate, acute, scarious, with ciliato keel, 1-nerved; floral glume nearly 1 in. long, broadly ovate, acute, membranous, 1-nerved, the heel nearly glabrous; palea oblong, obtuse. Stamens usually 3; filaments very long, not thickened at the base; anthers small. Grain -1 in. long, oblong-ellipsoid, compressed. Fl. B. I. v. 7, p. 235; Duthie, Fodd. Grass. N. Ind. p. 48; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 439.—Flowers: Dec.

Sixu: Bhulak, Colle!, Wealrow - Distain, India (Panjab, W. Himulaya, Kashmir, Bundelk and, Sand), westward to the Atlantic.

2. Heleochloa dura, Boiss. Fl. Orient. v. 5 (1881) p. 477. Perennial, pale, clothed all over with minute velvety pubescence; stems stout, ascending, 6-10 in. long, densely fastigiate from a woody inclined base which is clothed with leaf-sheaths, about $\frac{1}{10}$ in. in diam., hard, few-leaved; nodes glabrous. Leaves 3-6 in. long, involute, terete, rigid, pungent; sheaths short, coriaceous, glabrous; ligule a narrow line of hairs. Inflorescence a spike-like paniele reaching $\frac{3}{2}$ by $\frac{1}{6}$ in., solitary at the top of the stem. Spikelets densely imbricate, $\frac{1}{10}$ in. long. Glumes 3, all 1-nerved and with ciliate keels; lower involglume $\frac{1}{10}$ in. long, linear-oblanceolate, acute, apiculate; upper involglume $\frac{1}{10}$ in. long, linear-oblanceolate, apiculate; floral glume $\frac{1}{10}$ in. long, chiptic-oblong, obtuse, mucronate; palea $\frac{1}{10}$ in. long, 2-fid, with obtuse ciliate lobes, 2-nerved. Stamens usually 2, less commonly 3; filaments very long, thickened at the base; anthers short. Fl. B. I.

v. 7, p. 236; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 439.—Flowers: Dec.

Dalzell without locality in Herb. Kew.! Gujaran: Dwarka (Kathiawar), Woodrow. Sind: salt-water creeks, Stocks, 455!—Distrib. Arabia.

43. WOODROWIA, Stapf.

Annual. Leaves narrow, flat. Paniele terminal, contracted, pedunculate; rhachis short; branches very slender, simple. Spikelets 2-5, girt at the base with short shining hairs, 1-flowered, arranged along the inarticulate branches of the paniele, articulated with the pedicel which is dilated at the apex, laterally compressed, the flower hermaphrodite. Glumes 3; invol.-glumes empty, acute, more or less thickened on the rounded back, obscurely 1-nerved; lower invol.-glume longer and broader than the upper; floral glume about as long as the upper invol.-glume, hydine, 1-nerved, 2-lobed at the apex, with a slender geniculate awn between the lobes; palea hydine. Lodicules 2, cuncate, lobulate. Stamens 2. Styles distinct; stigman narrowly plumose, laterally exserted. Grain slender, cylindric, free within the glumes.—Distrib. W. Poninsula of India; species 1.

1. Woodrowia diandra, Stapf, in Hook. Icon. Pl. (1896) t. 2447. An annual grass 1½-2 ft. high. Lower leaves 3-4 by ½-½-½ in., narrowly linear, setaceously acuminate; uppermost leaves reduced or entirely suppressed, hirsute, margins scabrid; sheaths close, glabrous or hairy at the mouth; ligule short, truncate, ciliolate. Paniele about 2 in. long; rhachis stender; pedicels very short, ½-½ in. long; branches of paniele about 4. Spikelets ½ in. long, rather distant, green or tinged with violet. Glumes 3; lower invol.-glume more or less dorsally hairy, with ciliolate margins; upper invol.-glume with a densely ciliate keel; floral glume 2-lobed, with a geniculate awn about ½ in. long from the sinus; column of awn ¼ in. long, spirally ciliate, brown, the upper part of the awn yellow, longer than the column; palea obovate-obloug, hyaline, nerveless. Lodicules unequally lobed. Grain yellow, glabrous, ½-¾ in. long. Fl. B. I. v. 7, p. 241; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 439.—Flowers: Sept.-Oct. Venn. Kotir.

DECCAN: Lanoli, Woodrow, 24!-Distrib. India, W. Peninsula.,

44. GARNOTIA, Brongn.

Erect, perennial (rarely annual), stout or slender grasses. Leaves flat or convolute. Spikelets paniculate, very small, narrow, terete, 1-flowered, solitary or 2-nate, jointed on their pedicels; rhachilla not produced beyond the floret. Glumes 3; invol.-glumes subequal, lanceolate, acute, acuminate or awned, strongly 3-nerved, empty; floral glume as long as the invol.-glumes, lanceolate, acuminate or awned, thinly coriaceous or membranous, quite smooth, faintly 1-nerved, paleate, 2-sexual, tip acute or minutely 2-dentate; awn rarely jointed, sometimes geniculate, slender, scaberulous; palea as long as the glume, linear, the lobes minutely aurieled at the base. Lodicules 2. Stamens 3; anthers linear. Styles free; stigmas with simple hairs, laterally exserted. Grain linear or oblong, dorsally compressed, free within

the glume and palea.—Distrib. Species about 20, Asiatic and Polynesian.

1. Garnotia arborum, Stapf, MS. ex Woodrow, in Journ. Bomb. Nat. v. 13 (1901) p. 439. A low stiff erect annual grass 2-8 in. high, growing on trees amongst moss; stems tufted, terete, smooth, shining, glabrous, often tinged with red; nodes pubescent. Leaves 1-2 by 1 of -1 in., linear, acuminate, glabrous; sheaths glabrous, striate; ligule a narrow lacerate membrane. Inflorescence paniculate; branches 2-3, fascicled on the rhachis, the clusters 1-1 in. apart, angular, stout, trun-Spikelets I flowered, articulate on the ends of the branches, Lower invol.-glume 10-1 in. long, membranous, early decidnous. 3-nerved, the nerves hispid, the midrib produced into an awn equalling the glume or less; upper invol.-glume similar; floral glume nearly equalling the invol.-glumes, but more coriaccous, 2-toothed, with an awn in, long from between the teeth, obscurely nerved; palea hyaline, slightly smaller than the glume, acute, with large flaps at the base, nerveless. Stamens 3; anthers 10 in. long. Grain 10 in. long, ovoidlanceolate, acute at the apex, rounded at the base.—Flowers: Sept.

Decay: on trees at Nandgaon on the crest of the Ghâts 10 miles S. of Lanoli, Woodrow, 30! – Dr-ann. India (W. Pennsula).

• 2. Garnotia stricta, Brongn, in Daperr, Voy. Bot. (1829) p. 133, t. 21. Annual !; stems 1-2 ft. long, tufted, geniculate and often branched at the base, smooth, glabrous. Leaves 3-8 by 1 -3 in., lanceolate or linear lanceolate, glabrous or hirsute, or scabrous above, the margins flat or hirsute; sheaths usually glabrous; ligule a narrow ciliate membrane. Paniele 2-8 in. long, very narrow; branches in distant fascicles, scaberulous. Spikelets pale, 1 - 1 in. long, sparsely hairy at the base. Lower invol.-glume ovate-lanceolate, finely acuminate, 3-nerved, the midnerve sometimes excurrent; upper invol.-glume similar; floral glume entire or notched, usually awned, the awn ½ in. long or less. Fl. B. I. v. 7, p. 243; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 439; Prain, Beng, Pl. p. 1214; Watt, Dict. Econ. Prod. v. 3, p. 483.

Konkan: between Neral and Karjat, Woodrow!-Distrit. India (Himalayas, Khasia Hills, Behar, W. Penusula); Sandwich Islands.

45. TRACHYS, Pers.

A diffuse softly villous annual grass. Leaves ovate-lanceolate. Inflorescence of 2-3 spikes radiating from the top of a long peduncle; reachis broad, herbaceous, jointed, each joint bearing on the under surface at the articulation a solitary globose cluster of 2-3 perfect 1-flowered glabrous spikelets surrounded by many short spinescent glumes of imperfect ones. Glumes 4, very unequal; lower spinescent glume, tooth-like; upper invol.-glume elongate, linear-lanceolate, very acute, membranous, strongly nerved; lower floral glume much the largest, obliquely ovate or obovate-oblong, cuspidately acuminate, rigidly coriaceous, 9-many-nerved, paleate, empty, the palea minute; upper

1.

floral glume much shorter and narrower than the lower one, linearoblong, acuminate, chartaceous, smooth, dorsally convex, with incurved margins, 2-sexual; palea as long as the glume, acuminate, hyaline, the margins inflexed below the middle. Lodicules very minute or 0. Stamens 3; anthers linear. Styles very long; stigmas slender, penicillate, exserted at the top of the glume. Grain oblong, compressed, free within the glume and palea.—Discrib. India, Ceylon; species 1.

1. Trachys mucronata, Pers. Syn. v. 1 (1805) p. 85. 6-18 in. long, ascending or prostrate, leafy, glabrous; nodes villous. Leaves 1-4 by 1 3 m., ovate-lanceolate, acuminate, fluccid, softly villous on both surfaces, margins often crisped, base rounded; sheaths glabious or hairy; ligule a thin membrane. Peduncles reaching 8 in. long. slender, shining. Spikes 1-2 by $\frac{1}{10} - \frac{1}{6}$ in., stipitate, the stipes $\frac{1}{10} - \frac{1}{10}$ in. long, glabrous and more or less angular; rhachis rigidly herbaceous, with a broad flat midrib and broad closely nerved wings. Clusters of spikelets reaching I in. in diam., often partially sunk in a concavity of the rhachis; perfect spikelets reaching & in. long, the imperfect much shorter. Glumes 4; lower invol.-glume 1, 1, in, long, lanceolate, acute; upper invol.-glume & by 15 in., linear-fanceolate, very neute, 3-nerved, hyalino; lower floral glume 1 by 1 in., broadly and obliquely ovate or oborate, cuspidately acuminate, with many green nerves, paleate, the palea 1 in. long, oblong, obtuse, hyaline; upper floral glume 1 by Voodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435. Panicum squarrosum, Retz. Obs. fasc. 4 (1786) p. 15; Roxb. Cor. Pl. v. 3, t. 206.—Flowers: Aug. VERN. Devablata.

S. M. Oownen Dharwar, Woodrow; Badann, Cooke!, Woodrow!-Distrib. India (W. Peninsula), Ceylon

46. TRAGUS, Haller.

Annual or perennial grasses; stems erect, ascending or decumbent. Leaves linear, rather rigid, with cartilaginous spinulously ciliate margins; ligule a delicate ciliate rim. Spikelets in deciduous clusters of 2-4, on the filiform continuous axes of cylindric spike-like racemes or panicles. Lower invol.-glume minute, hyaline or suppressed; upper invol.-glume 5-ribbed or 5-nerved, membranous between the hispid or spinous-hooked ribs or nerves, exceeding the floral glume; floral glume solitary, lanceolate or oblong-lanceolate, membranous, 3-nerved, 2-sexual; palea as long as the glume, 2-nerved. Lodicules 2, broad, cuneate, fleshy. Stamens 3. Styles distinct, very slender; stigmas narrow, plumose, exserted from the top of the glume. Grain oblong to ellipsoid, free within the glume and palea.—Distrin. Species 2; one in South Africa, the other throughout the warmer parts of both hemispheres.

1. **Tragus racemosus**, Scop. Introd. (1777) p. 73. Stems tufted, leafy below, simple or branched, the branches often fasciculate and densely leafy, geniculate, ascending from a decumbent base or wholly decumbent, from a few inches to 1 ft. long; nodes glabious. Leaves variable in length, $\frac{1}{4}$ - $\frac{1}{2}$ by $\frac{1}{10}$ - $\frac{1}{6}$ in., linear-lanceolate, acuminate, flator undulate, rigid, very glaucous, subpungent, smooth, with pectinately

ciliate margins, closely striate; lowest sheaths short, broad, pale, the intermediate ones more or less herbaceous, the uppermost tumid, usually embracing the base of the paniele; ligule a slender ciliate rim. Inflorescence a cylindric spike-like paniele; ligule a slender ciliate rim. Inflorescence a cylindric spike-like paniele; ligule a slender ciliate rim. Inflorescence a cylindric spike-like paniele; ligule a slender ciliate rim. Inflorescence a cylindric spike-like paniele; ligule a slender, straight or slightly undulate, pubescent. Spikelets \(\frac{1}{8} \) in. long, acute, usually 2 facing each other and appearing like a single spikelet with 2 equal echinate glumes; pedicels stout, about \(\frac{1}{30} \) in. long. Glumes 3 or 2; lower invol.-glume very minute, about \(\frac{1}{30} \) in. long, hyaline, often suppressed; upper invol.-glume \(\frac{1}{8} \) in. long, slightly curved, involute, enveloping the floral glume, strongly 5-ribbed, with rows of stout hooked spines along the floral glume, strongly 5-ribbed, with rows of stout hooked spines along the floral glume, strongly 5-ribbed, with rows of stout hooked spines along the ribs, thin between the ribs; floral glume solitary, \(\frac{1}{1} \), in. long, oblong-lanceolate, shortly apiculate. Fl. B. I. v. 7, p. 97; \(\frac{1}{1} \), in. long, oblong-lanceolate, shortly apiculate. Fl. B. I. v. 7, p. 187; \(\frac{1}{1} \), in. long, oblong-lanceolate, shortly apiculate. Fl. Ceyl. v. 5, p. 187; \(\frac{1}{1} \), in. long, oblong-lanceolate, shortly apiculate. Fl. Ceyl. v. 5, p. 187; \(\frac{1}{1} \), in. long, oblong-lanceolate, shortly apiculate. Fl. Ceyl. v. 5, p. 187; \(\frac{1}{1} \), in. long, oblong-lanceolate, shortly apiculate. Fl. Ceyl. v. 5, p. 187; \(\frac{1}{1} \), in. long, oblong-lanceolate, shortly apiculate. Fl. Ceyl. v. 5, p. 187; \(\frac{1}{1} \), in. long, oblong-lanceolate, shortly apiculate. Fl. Ceyl. v. 5, p. 187; \(\frac{1}{1} \), in. long, oblong-lanceolate, shortly apiculate. Fl. Ceyl. v. 5, p. 187; \(\frac{1}{1}

Konnen: Sal-ette, Graham. Duccan: Bijapur, Cooke!, Woodrow!; Poona, Jacquement, 386! S. M. Countan: Badami, Woodrow! Gulantt: Domas, near Surat, Lew ex Graham; Rejkot (Kathiawar), Woodrow. Sind: Stocks!, Dalzell & Gilson.—Distant. More or less throughout the dry plains of India; Ceylon, all warm countries, Southern Europe.

47. LATIPES, Kunth.

A perennial rather rigid grass. Leaves subulate, convolute. Spikelets 1-flowered, in simple spike-like racemes, 2-seriate (1 usually imperfect), persistent on the flattened truncate spreading articulate pedicels; rhachis flexuous. Glumes 3; invol.-glumes thickly coriaceous; lower invol.-glume usually the longest, narrow, recurved, 3-nerved, with pectinate margins, dorsally smooth; upper invol.-glume lanceolate, spinulously tuberculate, embracing the floral glume; floral glume solitary, shorter than the upper invol.-glume, oblong, acute, hyaline; palea minute, linear-oblong. Lodicules 2, hyaline. Stamens 3; anthers oblong. Styles free. Grain free, obliquely ovoid-lanceolate.—Distrib. India. Beluchistan, Arabia, Abyssinia, Senegal; species 1.

1. Latipes senegalensis, Kuath, Revis. Gram. v. 1 (1829) p. 261, t. 42. Stems 3-12 in. long, wiry, creeping, with many erect or spreading branches, leafy. Leaves 1-3 in. long, subulate, convolute; sheaths glabrous, the mouth hairy; ligule 0. Racemes 2-6 in. long; rhachis glabrous; pedicels distant, γ_0^1 in. long, caneate, flattened, with winged and cibate margins, bearing at the broad apex 2 purplish-brown spikelets one perfect, the other not. Glumes 3; lower invol-glume rather more than $\frac{1}{2}$ in. long, lanceolate, narrow, recurved, 3-nerved, with pectinate margins, purplish-brown; upper invol-glume rather more than $\frac{1}{10}$ in. long, ovate-lanceolate, purplish-brown, tuberculate on the back; floral glume solitary, γ_0^1 in. long, ovate-oblong, acute, hyaline. Fl. B. I. v. 7, p. 97; Woodr, in Journ, Bomb, Nat. v. 13 (1901) p. 435.—Flowers: Sept.

Sinn: Jemadar ka Landa near Karachi, Stocks, 11861; 20 miles N. of Karachi, Woodrow,

48. ZOYSIA, Willd.

A small rigid glabrous grass, with a long with rootstock giving off short erect leafy branches terminating in solitary pedunculate spike-like recemes. Leaves distichous, subulate, concave, pungent. Spikelets ovoid, laterally compressed, 1-flowered, articulate on short or rather long stout angular pedicels appressed to a rigid rhachis. Glumes 2; invol.-glume empty, rigidly coriaceous, the margins closely appressed as if connate, with a membranous tip, nerveless; floral glume much smaller than and completely enclosed in the invol.-glume, ovate-lanceolate, hyaline, 1-nerved; palea linear-oblong, hyaline. Lodicules 0. Stamens 3; anthers long. Styles very long, connate below; stigmas plumose, exserted at the top of the spikelet. Grain oblong, free within the glume and palea.—Distrib. Tropical Asia, Australia, and Mauritius; species 1.

1. Zoysia pungens, Willd. in Ges. Naturf. Fr. New Schrift. v. 3 (1801) p. 411. Rootstock rigid, wiry, up to 2-3 ft. long, the branches interlaced and rooting, sending up short leafy stems 6-10 in. high, Leaves 1-3 in. long, coriaceous, dotsally rounded, subulate, concave, pungent; sheaths short; ligule a narrow cholate membrane. Racemes 1-1½ in. long, strict, erect. Spikelets ½ in. long, erect; pedicels usually short, angular. Invol.-glume biconvex, much compressed at the membranous tip, smooth and shining, thickly coriaceous; floral glume shorter and much narrower, hyaline; palea linear-oblong, nerveless. Fl. B. I. v. 7, p. 99; Trim. Fl. Ceyl. v. 5, p. 188; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435; Pram, Beng. Pl. p. 1186.

GUJARAT Damaun, Lesboa. I have seen no specimens from the Bombay Presidency; there are none in Heib Kew .- Districts, of the genus.

49. PEROTIS, Ait.

Small annual or subperennial grosses; stems tuited, leafy. Leaves usually broad, rigid and ciliato; ligules hyaline or 0. Spikelets very small, linear-lanceolate, sessile or subsessile on the continuous rhachis of a spike or a lax spike-like racemo, articulate on and falling entire from the rhachis or the very short pedicels. Glimes 3; invol.-glimes equal, empty, linear-lanceolate, rigidly membranous, with a strong midrib produced into a long capillary awu; floral glume solitary, lanceolate, acute, hyaline, 1-nerved, 2-sexual; palea narrow, hyaline, nerveless. Lodicules 2, broad, cuneate. Stamens 3. Styles short; stigmas plumose, laterally exserted. Grain cylindric, slender, exserted from the unchanged floret and enclosed with it in the invol.-glumes.—Distrib. Species 2 or 3, in the Tropics of the Old World and in subtropical Australia.

1. Perotis latifolia, Ait. Hort. Kew. v. 1 (1789) p. 85. Stems tufted, geniculate, suberect, ascending, 3-15 in. long, glabrous. Leaves \(\frac{1}{2}-1\frac{1}{2}\) by \(\frac{1}{8}-\frac{1}{3}\) in., ovate or lanceolate, from a broad amplexicant base, acute or acuminate, flat or somewhat undulate, glaucous, with rigidly culiate margins; lighte 0. Racemes slender, 2-8 in. long, dense; rhachis subterete, glabrous. Spikelets \(\frac{1}{1}\) in. long, narrowly linear, subterete, scaberulous. Invol.-glumes equal and similar, often purple, linear-lanceolate, each with a long scaberulous awn reaching sometimes

as much as § in. long, purple or yellow; floral glume solitary, very narrowly linear, rather shorter than the invol.-glumes. Grain ½ in. long, almost cylindric. Fl. B. I. v. 7, p. 98; Grah. Cat. p. 237; Dalz. & Gibs. p. 296; Trim. Fl. Ceyl. v. 5, p. 189; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 435; Prain, Beng. Pl. p. 1186.—Flowers: Oct.-Aug. Vern. Kuras.

Konkan: Malwan, Woodrow. S. M. Country: Badami, Cooke!, Woodrow! Gujarat: Baroda, Cooke!; Surat, Lisboa; Domas (near Surat), Dalzell & Gibson.—Distrib. More or less throughout India; Ceylon, S. Africa.

50. SPOROBOLUS, Br.

Perennial (rarely annual) glabrous grasses, erect or prostrate, or creeping. Leaves narrow, flat or convolute. Spikelets 1-flowered, small or minute, in effuse or contracted panicles, articulate on their pedicels; rhachilla not produced beyond the palea. Glumes 3, usually membranous, 1-nerved or nerveless; invol.-glumes empty, unequal, separately caducous; floral glume not articulate at the base, ovate or oblong, obtuse or acute; callus very short, glabrous; palea as long as the glume and of similar texture, broadly oblong, often dorsally narrowly inflexed along the median line, with a nerve-like ventral ridge along which the palea splits between the two very close often very obscure nerves. Lodicules very minute or 0. Stamens 2-3; anthers short or long. Styles 2, free; stigmas very short. Grain within the glume and palea, with oblong, obovoid Species about 70, in tropical and a loose hvaline subtropical regions of both hemispheres.

Invol.-glumes both shorter than the floral glume.

Panicle effuse.

Stamens 2, Stems 1-3 ft. high; panicle reaching 10 in. long; spikelets 20-15 in, long Whole plant scarcely 6 in. high; panicle 1 in. long; spikelets 1,5-1,4 in, long Stamens 3. Panicle narr w, 2-3 in. broad; spikelets reaching To in. long Paniele reaching 3 in. broad. Panicle 12-18 in. long; spikelets 2, in. long Panicle 4-6 in. long; spikelets 1, in. long Lower invol.-glume as long as the floral glume or nearly so; panicle interrupted Lower invol.-glume much shorter than either of the two others; upper invol.-glume as long as or longer than the floral glume. Panicle contracted. Annual; upper invol.-glume longer than the floral Perennial; upper invol.-glume about equalling the floral glume

- 1. Sporobolus diander, Beauv. Agrost. (1812) p. 26. Annual or perennial; stems tufted, 1-3 ft. high, slender, smooth; nodes glabrous. Leaves 4-10 by $\frac{1}{15} \frac{1}{16}$ in., with filterm tips, flat or convolute, smooth,

strongly nerved; sheaths smooth, ribbed, the lower short, the upper very long; ligule a very narrow ridge of minute hairs. Panicle reaching 10 by 2 in., erect, narrowly pyramidal; rhachis slender, quite smooth; branches capillary, erect or spreading, naked at the base, $\frac{1}{2}$ -2 in. long, with numerous very minute spikelets racemosely arranged along the branchlets. Spikelets $\frac{1}{20}$ - $\frac{1}{15}$ in. long; pedicels very short. Glumes 3; lower invol.-glume very short, scarcely $\frac{1}{20}$ in. long, broadly oblong, nerveless, hyaline, with erose tip; upper invol.-glume about $\frac{1}{20}$ in. long, broadly elliptic-oblong, hyaline, obscurely 1-nerved; floral glume $\frac{1}{20}$ - $\frac{1}{15}$ in. long, broadly ovate-oblong, subacute, 1-nerved; palea plicate in the median line. Stamens 2. Grain obvooid, truncate, obtusely quadrangular, umbonate by the loose pericarp, red-brown, rugulose. Fl. B. I. v. 7, p. 247; Dalz. & Gibs. p. 296; Trim. Fl. Ceyl. v. 5, p. 260; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 139; Prain, Beng. Pl. p. 1213; Watt, Diet. Econ. Prod. v. 6, part 3, p. 341.

Dicers. Poona, Jacquemont, 352!—Distrib. Throughout India; Coylon, Asia, Tropical Australia.

2. Sporobolus sindicus, Stapf, MS. in Herb. Kew. A low perennal 4--5 m. high; roots stout, wiry; stems densely tufted, the barren ones subwoody, 7^{1}_{2} in. in diam., clothed below with numerous withered leaf-sheaths, the flowering stems lateral from the barren ones, slender. Leaves pungent, those of the barren stems crowded, short, ovate-lanceolate to narrowly lanceolate, $1\text{--}\frac{1}{2}$ in. long, with spinous margins, those of the flowering stems narrowly linear, acuminate, distant, often with distantly spinous margins; sheaths closely appressed to the stem, ribbed; ligule a very narrow cluate membrane. Paniele 7--1 in. long, contracted, often spike-like; branches erect or ascending, filhform, densely clothed with spike-lets. Spike-lets $7\text{--}1^{1}_{2}$ in. long, ovoid, acute; pedicels short. Glumes 3, hyaline; lower invol.-glume $\frac{1}{15}$ in. long, ovate, acute, nerveless; upper invol.-glume $\frac{1}{10}$ in. long, obluse, nerveless; floral glume $\frac{1}{10}$ in. long, ovate, obtuse (acute when folded), 1-nerved; palea shorter than the glume, oblong, truncate. Stamens 2. Grain $\frac{1}{30}$ in. long, broadly obovoid, compressed, reddish-brown.— Flowers: Nov.

Sind: 20 miles from Karachi, Woodrow! There is but one sheet of this plant in Horb Kew, collected by Woodrow.

3. Sporobolus indicus, Br. Prodr. (1810) p. 170. Perennial; stems 2-3 ft. high, densely tutted, stout; internodes long; nodes glabrous. Leaves mostly crowded near the base, 1-2 ft. long, very slender, wiry, flexnous, convolute (rarely flat), with long filliform tips, quite smooth; sheaths smooth, ribbed; ligule a ridge of minute hairs. Panicies 1-1½ ft. long by ½-¼ in. broad, often interrupted; rhachis slender, smooth; branches very short, densely crowded, erect, covered to the base with imbricate green spikelets. Spikelets ½-¼ in. long; pedicels very short. Glumes 3; lower invol.-glume about ½ in. long, broadly oblong, nerveless, hyaline; upper invol.-glume ½ in. long, broadly oblong, hyaline, nerveless; floral glume ½-½ in. long, broadly ovate, 1-nerved; palea plicate in the median line. Stamens 3. Grain ½ in. long, obovoid, quadrangular, truncate, umbonate by the loose pericarp, red-brown, rugulose. Fl. B. I. v. 7, p. 247; Trim. Fl. Ceyl. v. 3,

p. 261; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 439; Prain, Beng. Pl. p. 1213; Watt, Dict. Econ. Prod. v. 6, part 3, p. 341.—Flowers: Oct.

Deccan: Kolhapur, Woodrow.—Distrib, Throughout India; Ceylon, most warm countries.

4. Sporobolus minutiflorus, Link, Hort. Reg. Berol. v. 1 (1827) p. 88. Stem 2-3 ft. high, slender, smooth; nodes glabrous. Leaves 6-10 by $\frac{1}{12} - \frac{1}{5}$ in., flat, finely acuminate, with smooth margins; sheaths long, ribbed, smooth; ligule a minute ring. Panicle 12-18 in. long, reaching 3 in. broad, effuse, supra-decompound; branches capillary. Spikelets $\frac{1}{25}$ in. long, dark-colored. Glumes 3; -lower invol.-glume about $\frac{1}{30}$ in. long, subquadate; upper invol.-glume $\frac{1}{50}$ in. long, broadly ovate, subobtuse, nerveless; floral glume $\frac{1}{25}$ in. long. ovate-oblong, subobtuse, nerveless; palea shorter, broad, truncate. Stamens 3, quickly falling with age. Grain $\frac{1}{30}$ in long, obovoid, compressed. Fl. B. I. v. 7, p. 248; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 439. —Flowers: Oct.

Konkan: Parel (Bombay), Woodrow! - Distrib. India (W. Peninsula).

5. Sporobolus ioclados, Nees, Fl. Afr. Austr. (1841) p. 161. An elegant perennial grass; stems 10-18 in. long, densely tufted, rather stout, erect, smooth, glabrous; nodes glabrous. Leaves 2-4 by $\frac{1}{10-\frac{1}{8}}$ in., flat or convolute, linear, tapering to a fine point; sheaths ribbed, glabrous, smooth; ligule a pubescent ridge. Panicle 4-6 by 2-3 in., orate or subpyramidal, effuse; branches opposite, or alternate, or the lower whorled, spreading, remotely branched, filiform, smooth. Spikelets $\frac{1}{12}$ in. long, oblong-lanceolate, pale. Glumes 3; lower involglume $\frac{1}{30}$ in. long, oblong-lanceolate, hyaline; upper involglume $\frac{1}{18}$ in. long, ovate, acute, 1-nerved; floral glume $\frac{1}{12}$ in. long, obtuse. Stamens 3, anthers $\frac{1}{30}$ in. long. Grain linear-oblong, $\frac{1}{30}$ in. long. Fl. B. I. v. 7, p. 249; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 439.

SIND: Stocks !- DISTRIB. S. Africa.

6. Sporobolus glaucifolius, Hochst. in Flora, v. 25, part 1 (1842) Beibl. p. 133 (nomen nudum), et ex Steud. Syn. Pl. Gram. (1855) p. 154 (under Vilfa). Perennual; stems 12-18 in. long, densely tufted, leafy; nodes glabrous. Leaves $1\frac{1}{2}$ -5 by $\frac{1}{10}\frac{1}{8}$ in., narrowed from a subcordate base to an acuminate tip, strict, glaucous, flat or undulate, not pungent; sheaths ribbed, glabrous; lighte a line of hairs. Panicle 3-5 in. long, contracted, interrupted, pale yellowish-white; branches short, erect. Spikelets crowded, $\frac{1}{12}$ in. long; pedicels very short. Glumes 3; lower invol.-glume $\frac{1}{16}$ in. long, lanceolate, hyaline, acutely acuminate, 1-nerved; upper invol.-glume $\frac{1}{12}$ in. long, broader than the lower, ovate-lanceolate, acutely acuminate, hyaline, 1-nerved; floral glume $\frac{1}{16}$ in. long, ovate, acute, 1-nerved; palea as long as the glume. Stamens 3; filaments very short; anthers $\frac{1}{30}$ in. long. Fl. B. I. v. 7, p. 250; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 439.—Flowers: Nov.

Dalzell without locality in Herb. Kew.! SIND: Stocks, 666!; Karachi, Woodrow, 18! - Distrib. India (Panjab, W. Peninsula); Tropical Africa.

- 7. Sporobolus piliferus, Kanth, Enum. Pl. v. 1 (1833) p. 211 (var. a). Annual; stems 3-12 in. high, tufted, erect; roots fibrous. Leaves 1-4 by $\frac{1}{10}$ $\frac{1}{10}$ in., chiefly radical, narrowed from the base to a fine point, flat or convolute, with scabrid or subservulate margins; sheaths hairy at the mouth; ligule a minute narrow line. Paniele linear, 1-3 in. long, strict, erect, dense-flowered, often interrupted; branches very short, erect. Spikelets $\frac{1}{10}$ $\frac{1}{12}$ in. long, pale brown; pedicels short. Glumes 3; lower invol.-glume $\frac{1}{10}$ in. long, ovatelanceolate, lyndine, nerveless; upper invol.-glume $\frac{1}{12}$ in. long, oblonglanceolate, lynerved, slightly longer than the floral glume; floral glume $\frac{1}{10}$ in. long, oblong, obtase, 1-nerved; palea oblong. Stamens 2. Grain ellipsoid, compressed, with a very loose pericarp, reddish-brown. Fl. B. I. v. 7, p. 251; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 439.
- S. M. Couven: Belgium, Ritchie, 836!—Distain, India (W. Himalaya, Khasia Hille, Nilglim Hills, W. Pennisula), Malacca,
- 8. Sporobolus orientalis, Kunth, Enum. Pl. v. 1 (1833) p. 211. Stolomterous, growing on salme soils; stolons stout or slender, rooting at the nodes; stems 6–18 in, high, stout at the base, hard, branching; branches and flowering stems usually generalate below. Leaves corraceous, variable, 1–8 by $\gamma_0^1 \frac{1}{3}$ in, usually more or less pungent, tapering to the tip, glabrous or hairy above and with scabrous or subserrulate margins; sheaths close, glabrous; ligule a slender ciliate membrane. Panicle narrow, oblong; branches $\frac{1}{2}$ $\frac{1}{3}$ in, long, subservet. Spikelets $\frac{1}{10}$ in, long. Glumes 3, hyaline; lower invol.-glume $\frac{1}{3}$ in, long, ovate-oblong, obtuse, nerved; supper invol.-glume $\frac{1}{10}$ in, long, ovate, subobtuse, 1-nerved; floral glume ovate-oblong, obtuse, scarcely longer than the upper invol.-glume, 1-nerved; palea ovate-oblong, obtuse, slightly shorter than the glume. KONKAN: Bombay, Law! Sind: Jemadar la Landa near Karachi, Stocks!— Distrib. India (Panjab, Oriss), Birma, W. Peninsula); Ceylon, Africa, Afghanistan.

51. ERAGROSTIS, Beauv.

Annual usually slender glabrous grasses of various habit; stems erect or ascending. Leaves narrow; ligule usually reduced to a line of Spikelets 2-many-flowered, in open or contracted panieles hairs. (rarely spicate), strongly laterally compressed, ovate-oblong or linear, not (or rarely) articulate on their pedicels on a simple terminal rhachis; rhachilla disarticulating above the invol.-glumes and between the floral ones, or tough and persistent, not produced beyond the upper floret. Glumes many, broad, obtuse, acute or mucronate, never awned, thin, dorsally rounded and keeled; invol.-glumes much shorter than the spikelet, equal or unequal, empty, persistent or separately deciduous, I (rarely 3)-nerved, usually membranous; floral glumes imbricating, at length deciduous from the rhachilla, 3-nerved, all 2-sexual or the uppermost and rarely the lowest imperfect, ovate to lanceolate, membranous to chartaceous, usually glabrous, the lateral nerves short, not reaching the midnerve; palex equal to their glumes or slightly shorter, membranous, 2-keeled, deciduous or persistent on the rhachilla. Lodicules 2, small, cuncate, more or less fleshy. Stamens 3 (rarely 2).. Styles distinct; stigmas plumose, laterally exserted. Grain minute, globose, oblong, ovoid or obovoid, free in the glume and palea .- Disraiu. In warm countries; species about 100.

Spikelet« panieled.

Rhachilla of spikelets more or less jointed and breaking up from above downwards.

Spikelets 1 in, long; panielo large, lax, thyrsiform, 8 20 by 1-6 in. 2. E. aspera.

1. E, ciliata.

Spikelets 3, in. long; paniele short, compart, cylindrie, 1-13 in. long	3. E. ciliaris
Spikelets 2-0-1 in, long; panicles 2-8 in, long. Grain ovoid; stamens 3.	var. brachystachya,
Stem and rhachis of panielo not viscid below. Paniele open; nodes bearded	4. E. tenella var. plumosa.
Panicle very narrow, contracted; rhachis glabrous	var. riparla. Var. tiscosa.
Grain oboxoid; stamens 2; panicle narrow, often intercapted, 6-18 in.long	5. E. interrupta - var. Kænigii;
Rhachilla of spikelets tough, persistent; flowering glumes falling away from its base upwards. Spiklets pedicellate. Spikelets flat, ovate-elliptic or oblong; lateral nerves of	•
flowering glumes very prominent, straight, almost percurrent; paless decidious with their glumes Spikelets less compressed, linear or linear-oblong; lateral nerves less prominent; when spikelets compressed or lateral nerves prominent, then with persistent paless.	6. F. amabilis.
Spikelets more or less fascicled on the primary or secondary branches or shortly pedicellate in narrow racennes.	•
Leaves glaucous; grain oblong Leaves not glaucous; grain globoso or nearly	7. E. gangetica,
Spikelots not fascicled; long-pedicellate, more or less divarieate when ripe.	8. E. stenophylla,
Leaf-margins glandular.	**
Lower involglume 1-9-nerved; upper involglume 3-nerved Both involglumes 1-nerved Leaf - margins eglandular; involglumes 1-	9. E. major 10. E. minor.
nerved. Spikele(s versatile, 1 in, or more long,	•
narrowly linear; branches of panicle solitary	11. E. tremula.

less whorled	,
Spikelets distichously spreading, secund, in a long simple terminal spike; keels of palea winged	•
1. Eragrostis ciliata, Necs, Agrost. Bras. (1829 (nomen mudum). Perennial; stems 1-2! ft. long, erec ascending, terete. Leaves linear-lanceolate, finely nous 2-6 by $\frac{1}{10-6}$ in., flat or convolute, smooth, glabrous; at the mouth; ligule of a few hairs. Panicle spicifo cylindric, compact; branches much shortened; rhachis the nodes. Spikelets $\frac{1}{10-6}$ in. long, much compressed	t or generately ninate, spreading, sheaths, hearded rm, 2-3 by. In., finely hearded at

Spikelets 10 in. long, much compressed, 6-12-flowered.

Invol.-glumes ovate, acute, hyaline, ciliate; floral glumes 10-15 in. long,

broadly ovate, cuspidately acuminate, subhyaline, very minutely scaberulous, the margins ciliate and the nerves prominent; palea shorter than its glume with ciliate keels. Grain ovoid to ellipsoid, $\frac{1}{10}$ in. long, terete. Fl. B. I. v. 7, p. 313; Dalz. & Gibs. p. 298; Prain, Beng. Pl. p. 1220. Poa ciliata, Roxb. Fl. Ind. ed. Wallich, v. 1 (1820) p. 336.

GUJARAT: Domas near Surat, Dalzell & Gibson.

This plant has been included on the authority of Dalzell & Gibson in their 'Bombay Flora.' I have seen no specimens from Bombay, nor does Woodrow include the plant in his list in the 'Bombay Journal of Natural History.' Dalzell's description of the plant is accurate.—Distrib. India (Chota Nagpur, W. Peninsula); Cochinchina.

2. Eragrostis aspera, Nees, Fl. Afr. Austr. (1841) p. 408. Annual; stems 8-20 in. high (excluding the panicle), stout, suberect, usually tuited, smooth and shining; nodes glabrous. Leaves 8-18 by $\frac{1}{6-\frac{1}{4}}$ in., linear, flat, glabrous; sheaths bearded at the mouth, otherwise glabrous; ligule a fringe of long hairs. Panicle lax, open, thyrsiform, oblong to obovate-oblong, 8-20 by 4-6 in.; rhachis terete, scaberulous, hearded at the nodes; branches solitary or falsely whorled, capillary, loosely and repeatedly divided from near the base; pedicels longer than the spikelets, very slender. Pedicels scattered, linear-oblong, $\frac{1}{5}$ by $\frac{1}{25}$ in., erect, 4-16-flowered; rhachilla very slender, breaking up. Invol.-glumes subequal, oblong, obtuse, $\frac{1}{25}$ in. long, 1-nerved; floral glumes about $\frac{1}{16}$ in. long, obliquely ovate-oblong, with prominent nerves; palea obscurely and obtusely 3-lobed, the keels scabrid. Stamens 3; anthers $\frac{1}{50}$ in. long. Grain subglobose, about $\frac{1}{60}$ in. in diam. Fl. B. I. v. 7, p. 314; Lisboa, in Journ. Bomb. Nat. v. 7 (1893) p. 386; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441.

Konkan: Lisboa! Kanara: N. Kanara, Lisboa!—Distrib. India (S. India, W. Peninsula); Ceylon, Tropical and S. Africa, Islo of France.

3. Eragrostis ciliaris, Link, Hort. Reg. Berol. v. 1 (1827) p. 192. Var. brachystachya, Boiss. Fl. Orient. v. 5 (1881) p. 582. Stems 6-10 in. long, tufted, geniculately ascending, glabrous, smooth. Leaves 2-3 by $\frac{1}{20-12}$ in., linear, tapering to a fine point; sheaths striate, usually bearded at the mouth with long bairs; ligule a fringe of short hairs. Panicle short, $\frac{1}{2}-1\frac{1}{2}$ in. long, oblong, cylindric, appearing hairy from the long cilia of the palew; branches short, suberect. Spikelets $\frac{1}{10}$ in. long, crowded, 6-12-flowered, strongly compressed; rhachilla breaking up; pedicels very short. Invol.-glumes subequal, ovate-lanceolate, acute, reaching $\frac{1}{10}$ in. long; floral glumes $\frac{1}{20}$ in. long, oblong, subtruncate, mucronulate, spreading; palew equal to their glumes and falling with them, the keels with long rigid cilia. Stamens 3; anthers very short. Grain elongate-ovoid, about $\frac{1}{50}$ in. long. Fl. B. I. v. 7, p. 314; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441.—Flowers: Nov.

Dalzell without locality in Herb. Kew.! Gujarat: Baroda, Woodrow. Sind: Stocks!; Jemadar ka Landa near Karachi, Stocks!—Distrib. India (Upper Gangetic plain, W. Peninsula); Arabia, Tropical Africa.

4. Eragrostis tenella, Roem. & Schult. Syst. v. 2 (1817) p. 576. A very variable annual with slender densely tufted stems, of which the following varieties are found or said to be found in the Bombay Presidency.

Var. 1. plumosa, Stapf, in Hook. f. Fl. B. I. v. 7 (1896) p. 315. Stems tufted, sometimes reaching 15 in. high or more, and as well as the paniele eglandular. Paniele delicate, open, often flexuous; rhachis bearded at the nodes; pedicels distinct, often long. Spikelets 3-9-flowered, $\frac{1}{20}$ in. long. Invol.-glumes unequal, the lower distinctly shorter than the upper; floral glumes $\frac{1}{30}$ in. long; keels of the palea pectinately ciliate with long hairs; anthers minute. Grain ovoid, about $\frac{1}{30}$ in. long. Trim. Fl. Ceyl. v. 5, p. 291; Prain, Beng. Pl. p. 1220. Eragrostis plumosa (sp.), Link, Hort. Reg. Berol. v. 1 (1827) p. 192 (not of Boiss.); Lasboa, in Journ. Bomb. Nat. v. 7 (1893) p. 385; Watt, Dict. Econ. Prod. v. 3, p. 255. E. tenella, Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441.—Flowers: Nov. Venn. Woya; Bakrálu.

KONKAN: common, Lisboa. Deccan: Poona, Cooke!, Woodrow. Gujarat: Surat, Woodrow.-Distrib Throughout India; Ceylon.

Var. 2. riparia, Stapf, in Hook. f. Fl. B. I. v. 7 (1896) p. 315. Stems and panicle eglandular. Panicle delicate, contracted, very narrow, flaccid, 1-3 by \(\frac{1}{2}\)-\(\frac{1}{2}\) in., subcylindric; rhachis glabrous; branches very short, erect, smooth, glabrous. Spikelets crowded. Invol.-glumes unequal, the lower \(\frac{1}{2}\) shorter than the upper; floral glumes \(\frac{1}{25}\) in. long. Anthers about \(\frac{1}{105}\) in. long. Grain \(\frac{1}{65}\) in. long, ovoid. Prain, Beng. Pl. p. 1220. Evagrostis riparia (sp.), Steud. Syn. Gram. (1855) p. 265. Poa tenella, Roxb. Fl. Ind. v. 1 (1832) p. 337; Grah. Cat. p. 236. This has been included on the authority of Graham (l. c.), who, however, gives no habitat. I have seen no specimens from the Bombay Presidency.

Var. 3. viscosa, Stapf, in Hook, f. Fl. B. I. v. 7 (1896) p. 315. Stems and rhachis of the panicle more or less viscid. Panicle stiff, stouter and with firmer and more strongly nerved glumes than in vars, planosa and riparia, oblong to linear, 2-3 by \(\frac{1}{2}\)-1 in.; branches spreading, filiform, often very short; rhachis usually glabrous (rarely obscurely bearded at the nodes). Spikelets 5-20-flowered, often purplish. Invol.-glumes nearly equal or the lower very slightly shorter than the upper; floral glumes \(\frac{1}{2}\)_{\frac{1}{2}\]_{\text{in}} in, long. Anthers about \(\frac{1}{10}\)_{\text{in}} in long. Grain ovoid, \(\frac{1}{6}\)_{\text{o}}\]_{\text{o}} in, long. Trim. Fl. Ceyl. v. 5; p. 291; Prain, Beng. Pl. p. 1220. Eragrostis viscosa, Trin. in Mém. Acad. Pétersb. sér. 6, v. 1 (1831) p. 397; Dalz. & Gibs. p. 298; Lishoa, in Journ. Bomb. Nat. v. 7 (1893) p. 386. Poa viscosa, Reta. Obs. fasc. 4 (1786) p. 20; Roxb. Fl. Ind. v. 1 (1832) p. 336; Grah. Cat. p. 236.

Konkun Malabar Hill (Bombay), Graham, Dalzell & Gibson, Lishea; Chompiti (Bombay), Lishoa. The viscid substance on the plant has a balsamic odor (Dalzell & Gibson).—Distrib. India (southern districts); Ceylon, Tropical and S. Africa.

5. Eragrostis interrupta, Beauv. Agrost. (1812) p. 71 (not of Roem. & Schult. nor of Trin.). Var. Kænigii, Stapf, ia Hook. f. Fl. B. I. v. 7 (1896) p. 316. A tall glabrous annual or perennial grass; stem erect, 1-3 ft. high or more, smooth and polished; nodes glabrous. Leaves 3-10 in. long, narrow, flat; sheaths glabrous, close; ligule a fimbriate membrane. Paniele erect, 6-18 in. long, contracted; branches filiform, often distant, 2 or more proceeding from the same level and giving the paniele a verticillate appearance. Spikelets small, \(\frac{1}{2}\frac{1}{2}\) in. long, usually 6-14-flowered, smooth, often tinged with red, pedicellate; rhachilla articulate between the flowering glumes, glabrous, di-articulating from above downwards. Invol.-glumes subequal, about \(\frac{1}{2}\text{0}\) in.

long, ovate-oblong, obtuse, hyaline, 1-nerved; floral glumes about $\frac{1}{30}$ m. long, ovate-oblong, obtuse; palea linear-oblong, with smooth or slightly scaberulous keels. Stamens 2; authers small. Gram obovoid. Trim. Fl. Ceyl. v. 5, p. 292; Woodr. m Journ. Bomb. Nat. v. 13 (1901) p. 441; Pram, Beng. Pl. p. 1220. Eragrostis Kæmju, Link, Hort. Reg. Bot. Berol. v. 2 (1833) p. 294 in syn. Eragrostis nutans, Nees, ex Wight, Cat. (1833) n. 1776, et ex Steud. Nom. ed. 2, part 1 (1840) p. 563; Dalz. & Gibs. p. 297; Lisboa, in Journ. Bomb. Nat. v. 7 (1893) p. 381; Watt, Dict. Econ. Prod. v. 3, p. 255.—Flowers: Nov. Vern. Chiksi.

6. Eragrostis amabilis, Wight & Arn. ev Necs, in Hook. & Arn. Bot. Beech. Voy. (1841) p. 251 (not of Linn.). Annual, glabious; stems 6-18 in. long, tufted, slender, erect or geniculately ascending, leafy chiefly at the base; internodes long. Leaves 3-6 by $\frac{1}{10}$ in, narrowed from a broad subcordate base to an acute tip, smooth; sheaths smooth, glabious; ligule 0 or obscure. Panicle oblong or ovoid, 2-4 in. long, sparingly branched; rhachis and nodes glabrous. Spikelets $\frac{1}{6}$ - $\frac{1}{4}$ in. long, compressed, ovoid elliptic or oblong, 20-50-flowered, shortly pedicellate, often purple; rhachilla tough, internodes very short. Glumes elegantly distichous, spreading, keeled; invol-glumes subequal or the upper slightly longer than the lower, $\frac{1}{25}$ $\frac{1}{16}$ in. long, ovate, acute, 1-nerved; floral glumes broadly ovate or suborbicular, mucronulate, $\frac{1}{12}$ in. long, punctulate; palea shorter than its glume and deciduous with it. Stamens 3; antheis minute. Grain oboyoid or ellipsoid, laterally compressed, about $\frac{1}{30}$ in. long, orange-brown, smooth. Fl. B. I. v. 7, p. 317; Trim. Fl. Ceyl. v 5, p 293; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441; Prain, Beng. Pl. p 1220. Enagrostis unioloides, Nees, ex Steud Syn Gram. (1855) p 264. Lisbon, in Journ. Bomb. Nat. v. 7 (1893) p. 383. Poa unioloides, Retz. 7. Eragrostis gangetica, Steud. Syn. Gram. (1855) p. 266. Perennial; stems tufted, 1-3 tt. long, stout, smooth, shining, simple or branched, suberect. Leaves few, 2-8 in. long, very narrow, convolute, rigid, quite smooth, glaucous, linear, tapering to a fine point, sheaths glabrous except the mouth which is sometimes bearded; ligule a minutely ciliolate rim. Panicle oblong, 2-6 in. long, nodding; branches solitary, rather distant, often long, suberect or the lower spreading; ihachis glabrous; pedicels of spikelets short. Spikelets \(\frac{1}{6}\)-\frac{1}{6}\)-\frac{1}{1}\) in long, linear to linear-oblong, 10-30-flowered; rhachilla tough, glabrous, persistent, the internodes short. Lower invol.-glume \(\frac{1}{16}\) in long, ovate-oblong, acute, 1-nerved; upper slightly larger, 1-nerved; floral glumes broadly ovate, subacute, reaching to nearly \(\frac{1}{10}\) in long, palea deciduous, slightly shorter than its glume, with scabernlous keels,

Stamens 3; anthers about $\frac{1}{15}$ in, long, yellow. Grain oblong, about $\frac{1}{12}$ in, long, brown. Trim. Fl. Ceyl. v. 5, p. 293; Stapf, in Dyer, Fl. Capen. v. 7 (1900) p. 617; Prain, Beng. Pl. p. 1221. Eragrostis elegantula, Stapf, in Hook. f. Fl. B. I. v. 7 (1896) p. 318 (not of Nees); Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441. E. Brownei, Nees, ex Wight, Cat. n. 1780; Watt, Dict. Econ. Prod. v. 3, p. 253.— Flowers: Dec.-Apr.

DECCAY: Borkas, Máwal (Poona districts), Woodrow.—Distrib. Throughout India; Ceylon.

8. Eragrostis stenophylla, Hochst, ex Miq. Analect. Bot. Ind. part 2 (1851) p. 27. Perennial; stems densely tufted, 12-18 in, high, erect or geniculately ascending, simple or branched; upper internodes long. Leaves 3-5 in. long, very narrow, strict, rather stiff, usually convolute, smooth, quite flat, glabrous, not glaucous; sheaths smooth; ligule a narrow membranous line. Panicle ovate, or oblong, or sublinear, subcreet or nodding; branches rather distant, alternate, obliquely spreading when ripe, much divided upwards; rhachis slender, smooth; pedicels of spikelets filiform. Spikelets 1-1 in. long, linear-oblong, 20-30-flowered; rhachila zig-zag. Lower invol.-glume in long, ovate-oblong, subscute; upper invol.-glume slightly longer, both hyaline, 1-nerved; floral glumes broadly ovate, subacute, about 7 in. long, with smooth keels; palea linear-oblong, caducous with the glumes, the keels Stamens 3; anthers minute. Grain globose or globosely ellipsoid, 10 in. long, reddish-brown, smooth. Fl. B. I. v. 7, p. 318; Trim. Fl. Ceyl. v. 5, p. 291; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441; Prain, Beng. Pl. p. 1221. Eragrostis Brownei, Nees, in Wight, (at. (1833) n. 1780 (partly); Watt, Diet. Econ. Prod. v. 3, p. 253.

Kouku: Malwan, Woodrow Dicess Borkas, Mawal (Poona districts), Woodrow. —Distrib. More or less throughout India; Ceylon, Tropical Asia and Africa.

9. Eragrostis major, Host, Gram. Austr. v. 4 (1809) p. 14, t. 24. Annual; stems 1-3 ft. high, usually stout and branched, leafy, erect or geniculately ascending, smooth, polished. Leaves reaching 8 by 1 in., narrowed to a fine point, flat, smooth, flaceid, glandular along the margins; sheaths sparingly bearded; ligulo a ciliolate ridge. Panicle 2-8 in. long, erect, oblong or ovate-oblong, open or sometimes conuncted, usually stiff; rhachis strict, rather stout, smooth; branches spreading or subcreet, capillary, stiff or flexuous, again branching from near the base, the branchlets short, capillary. Spikelets longer than their pedicels, usually crowded, orate and 1-1 in. long with 6-8 glumes, to linear-oblong rather narrowed upwards, and 1-1 in, long or more with many (up to 60) glumes, olive-grey or yellowish; rhachilla tough, rig-rag, the internodes short, smooth. Invol.-glumes orate, acute, with scabrid keels; lower smaller than the upper, 1 (sometimes 3)-nerved; upper slightly larger than the lower, 3-norved; floral glumes broadly ovate, acute, sometimes apiculate, 17 in. long, strongly nerved; palea obovate, much curved, shorter than its glume, with ciliolate keels. Stamens 3; anthers of in. long. Grain globose, in in diam., microscopically rugulose, reddish-brown. Fl. B. I. v. 7, p. 320; Trim. Fl. Coyl. v. 5, p. 297; Woodr. in Journ. Bomb. Nat. v. 13 (1901) v. 4-11; Prain, Bong. Pl. p. 1221. Eragnostis megastachya, Link, Hort.

Reg. Berol. v. 1 (1827) p. 187; Lisboa, in Journ. Bomb. Nat. v. 7 (1893) p. 382; Watt, Dict. Econ. Prod. v. 3, p. 254.—Flowers: Nov.—Jan.

DECCAN: Poona, Jacquemont, 349!, Woodrow. S. M. Country: Badami, Woodrow! Gujarat: Morvi (Kathiawar), Woodrow. Sind: Woodrow.—Distrib. More or less throughout India; Ceylon, westwards to S. Europe, tropical and subtropical Asia.

10. Eragrostis minor, Host, Gram. Austr. v. 4 (1809) p. 15 (in note) et in Pl. Austriac. v. 1 (1827) p. 135. Annual; stems 6-18 in. high, densely tufted, slender. Leaves $1\frac{1}{2}$ -6 by $\frac{1}{10}$ - $\frac{1}{3}$ in., linear, acute, usually glandular along the margins, flat; sheaths shortly bearded at the mouth; ligule a pubescent ridge. Panicle oblong or ovate, rather stiff, 2-6 in. long; rhachis glabrous; branches spreading when mature. Spikelets linear to ovate, $\frac{1}{4}$ by $\frac{1}{20}$ in., up to 12-flowered, pale green to purplish- or olive-grey; pedicels shorter than the spikelets, except the terminal ones; rhachilla tough. Invol.-glumes subequal or the upper slightly larger, about $\frac{1}{20}$ in. long, ovate, acute, 1-nerved; floral glumes about 16 in. long, ovate, acute, strongly nerved; palea obovate-oblong, about $\frac{10}{25}$ in. long, shorter than the persistent glumes, the keels scabrid or slightly ciliolate. Stamens 3; anthers about $\frac{1}{100}$ in. long. Grain in long or more, dorsally rounded or slightly flattened. Fl. B. I. v. 7, p. 321; Woodr. in Journ. Bomb. Nut. v. 13 (1901) p. 441; Prain, Beng. Pl. p. 1221.—Flowers: Nov.

Not very plentiful in the Bombay Presidency. Konkan: Bombay, Lambert! Decgan: Poona, Jacquemont, 350!; Nasik, Lisboa. Gujarat: Godra, Woodrow; Panch Maháls, Woodrow.—Distrib. More or less throughout India (plentiful in N. India); S. and Central Europe, N. Asia, N. Zealand, Philippines.

11. Eragrostis tremula, Hochst. ex Steud. Syn. Gram. (1855) p. 269. Annual; stems densely tufted, subcrect, 6-24 in. long. Leaves 2-5 by $\frac{1}{12}$ - $\frac{1}{6}$ in., linear-lanceolate, tapering to a fine point; sheaths bearded at the mouth; ligule a minutely hairy line. Panicle large, ovate, very diffuse; branches solitary, filiform; pedicels very slender, from ½ the length of the spikelets to longer than them; rhachis glabrous or bearded at the nodes. Spikelets 1 in. or more long, linear, narrower upwards, from 10-60-flowered. Invol.-glumes subequal, \frac{1}{20}-1 in. long, subobtuse, thin, 1-nerved; rhachilla tough, glabrous; floral glumes closely set, broadly ovate, subobtuse, $\frac{1}{16}$ $\frac{1}{12}$ in long, with strong nerves; palea obovate-oblong, slightly shorter than its glume, persistent, with scabrid keels. Stamens 3; anthers minute. Grain scarcely $\frac{1}{50}$ in. in diam., globose or nearly so. Fl. B. I. v. 7, p. 320; Lisboa, in Journ. Bomb. Nat. v. 7 (1893) p. 382; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441: Prain, Beng. Pl. p. 1221. Eragrostis multiflora, Trin. in Mém. Acad. Pétersh. sér. 6, v. 1 (1831) p. 401; Dalz. & Gibs. p. 298. E. rhachitricha, Hochst. ex Miq. Analect. Bot. Ind. part 2 (1851) p. 25; Watt, Dict. Econ. Prod. v. 3, p. 256.—Flowers: Nov.

Deccan: Lanoli, Lisboa. Gujarat: Woodrow; Gogo (Kathiawar), Dalzell & Gibson, Woodrow.—Distrib. India (Paujab, Bengal, Birma, W. Peninsula); Afghanistan, Tropical Africa.

12. Eragrostis tenuifolia, Hochst. in Flora, v. 24, part 1 (1841), Intelligenz. p. 20 (nomen nudum). Perennial; stem 2-3 ft. high, erect, slender, branched. Leaves long, very narrow; mouth of sheath naked.

Panicle 3-6 in. long, oblong to ovate, very open; rhachis glabrous; branches solitary or 2-nate, distant. Spikelets $\frac{1}{4}$ in. long or less, linear, 5-15-flowered. Invol.-glumes very unequal; lower minute, hyaline; upper remote from and larger than the lower, about $\frac{1}{36}$ in. long, ovate, subacute, usually nerveless; floral glumes $\frac{1}{12}$ in. long, ovate, subacute or apiculate; palea shorter than its glume, strongly curved, persistent, with scabrid keels. Stamens 3; anthers $\frac{1}{25}$ in. long. Grain $\frac{1}{12}$ in. dong, obovoid-oblong, slightly compressed, dorsally grooved. Fl. B. I. v. 7, p. 322; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441; Prain, Beng. Pl. p. 1221.

S. M. Country: Belgnum, Ritchie!-Distrib. India (W. Peninsula); Tropical Africa.

13. Eragrostis pilosa, Beauv. Agrost. (1812) p. 71. Annual; stems 6-24 in. high, tuited, erect or geniculately ascending, slender, flaccid. Leaves usually short and narrow (rarely elongate), generally convolute; sheaths appressed, glabrous, bearded at the month; ligule a softly hairy ridge. Paniele 2-6 in. long, erect or inclined, oblong to pyramidal, open or contracted; rhachis glabrous or hairy, filiform; branches fascicled or whorled, capillary, much divided. Spikelets scattered (not fascicled), \(\frac{1}{8} - \frac{1}{5}\) by \(\frac{3}{10} - \frac{1}{26}\) in., linear, 5-12-flowered, often purpli-h; pedicels longer or shorter than the spikelets; rhachilla tough, smooth, flexuous. Glumes all hyaline; invol.-glumes very unequal; lower ovate, nerveless; upper much larger, ovate-lanceolate, acuminate, 1-nerved; floral glumes \(\frac{1}{16} - \frac{1}{16}\) in. long; palea subpersistent, the keels scaberulous or nearly smooth. Grain ellipsoid, \(\frac{1}{1-\frac{1}{25}}\) in. long, laterally apiculate at the base. Fl. B. L. v. 7, p. 323; Lisbon, in Journ. Bomb. Nat. v. 7 (1893) p. 381; Trim. Fl. Ceyl. v. 5, p. 296; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441; Prain, Beng. Pl. p. 1221; Watt, Diet, Econ. Prod. v. 3, p. 255.

Dicens: Waghoti, Mawal (Poona districts), Woodrow, 91; Poona, Cooket; Nasik, Lisboa S. M. Cockerr: Dharwar, Woodrow, Sind: Woodrow,—District, Throughout India, Ceylon, S. Europe and most warm countries.

14. Eragrostis cynosuroides, Beauv. Agrost. (1812) p. 71 & p. 162. Perennial, tall, branched from the base; rootstock stout, creeping; stolons very stout, covered with shining sheaths; stems 1-3 ft. high, tufted, smooth, erect, stout. Leaves many, the basal fascicled, reaching sometimes 20 in. long and 3 in. broad at the base, rigid, acuminate, with filiform tips and hispid margins; sheaths glabrous; ligulo a hairy line. Panicle 6-18 by 1-11 in., strict, erect, narrowly pyramidal or columnar, often interrupted; rhachis puberulous; branches many, short, scarcely reaching 1 in. long, crowded, clothed from the base with sessile imbricating spikelets. Spikelets sessile, secund, 2-scriate and crowded, deflexed, pale brown, rather shining, 1 in. long, up to 30-flowered; rhachilla tough. Invol.-glumes very unequal; lower to in. long; upper 16 in. long, obtuse; floral glumes 16-11 in. long, orate, acute, coriaceous; palea shorter than its glume, subcoriaceous, with minutely scabrid keels. Stamens 3; anthers 30 in. long. Grain 10 in long, obliquely ovoid, laterally compressed, obscurely 3-gonous. It. B. I. v. 7, p. 324; Dalz. & Gibs. p. 298; Lisbon, in Journ. Bomb. Nat. v. 7 (1893) p. 387; Woodr. in Journ. Bomb. Nat. v. 13 (1901)

p. 441; Prain, Beng. Pl. p. 1221; Watt, Diet. Econ. Prod. v. 3, p. 253. Poa cynosuroides, Retz. Obs. fase. 4 (1786) p. 20; Grah. Cat. p. 236.—Flowers: Dec. Venn. Darbha; Kusha.

Decens: Nasik, Lisbon, Gefarat: Lisbon; Mandri (Kathiawar), Woodrow, Sind: Hyderabad, Woodrow, District. Throughout India in hot and dry places; Nubia, Egypt, Syria.

15. Eragrostis bifaria, Wight, &x Stend. Nom. ed. 2, part 1 (1840) p. 562. Perennial; stems 1-3 ft. high, densely tufted, erect, simple, subcompressed, glabrous, clothed at the base with the soft fibres of old sheaths. Leaves 2-4 in. long, narrow, linear, acute, rigid, smooth; sheaths glabrous, keeled; ligule a pubescent line. Spikelets secund, distichously spreading in a long simple terminal spike 10-12 in. long. Spikelets avoid to oblong, 15-20-flowered, \{-\} in. long (rarely linear, reaching \(\frac{7}{3}\) in. long and up to 40-flowered), laterally compressed, olive-grey or -green. Invol.-glumes strongly 1-nerved and keeled; lower invol.-glume \(\frac{1}{3}\) in. long, acutely acuminate, with scaberulous keel; upper invol.-glume \(\frac{1}{3}\) in. long, with stout rounded keel; floral glumes broadly ovate, subacute, \(\frac{1}{3}\) in. long; palea slightly shorter than its glume, with winged keels, the wings \(\frac{1}{100}\) in. wide, ciliolate. Stamens 3: anthers \(\frac{1}{3}\) in. long. Fl. B. I. v. 7, p. 325; Lisboa, in Journ. Bomb. Nat. v. 7 (1893) p. 387; Woodr. in Journ. Bomb. Nat. v. 13 (1901). p. 441.—Flowers: Aug.

Deceys: Khandala, Woolrow. S. M. Coustry: Belgaum, Ritchic,—Distuin, India (W. Peninsula); Tropical Africa.

52. HALOPYRUM, Stapf.

A tall stout perennial glabrous grass with a branching creeping sheathed rootstock. Leaves narrow, rigid, convolute. Spikelets large, many-flowered, sessile or shortly pedicellate on the short alternate branches of an elongate paniele, ovoid, strongly laterally compressed, not jointed on their pedicels, nor are the pedicels jointed on the branches; rhachilla articulate at the base and between the flowering glumes, silkily hairy. Glumes many, closely distichously imbricate, dorsally rounded, coriaceous, keeled; invol.-glumes subequal, ovate-lanceolate, acuminate or apiculate; lower invol.-glume 1-3-nerved; upper invol.-glume 5-nerved; floral glumes 6-10, rather shorter than the involucral, mucronulate, 3-nerved; palea as long as the glume, subacute, 2-keeled. Lodicules 2, obcordate. Stamens 3. Styles short, free; stigmas elongate. Grain ellipsoid, compressed, deeply hollowed anticously, free.—Distrib. Coasts of India and Ceylon, Arabia, Tropical Africa; species 1.

1. Halopyrum mucronatum, Stapf, in Hook. Icon, Pl. v. 25, t. 2148 (1896). Rootstock sending up hard woody stems 12-18 in. high and as thick as a crow-quill, smooth, shining, with strict vermiform roots, the branches often fascicled and clothed at the base with pale coriaceous shining mucronate sheaths. Leaves 8-12 by $\frac{1}{6}-\frac{1}{6}$ in., convolute (rarely flat), very narrow, glaucous, coriaceous, striate, quite smooth; sheaths tereto, appressed, striate, hard, with villous mouth; lighly a few hairs. Panielo 12-16 in. long, erect or nodding; rhachis and branches quite smooth, angular, wiry. Spikelets $\frac{1}{2}-\frac{6}{6}$ in. long, flat,

sessile or shortly pedicellate, 10-15-flowered, smooth, white or pale yellowish; rhachilla very short, the hairs half as long as the glumes. Lower invol.-glume \(\frac{1}{2}\) in. long, scarcely longer than the lowest flowering glume, ovate-lanceolate, apiculate; upper invol.-glume \(\frac{1}{2}\) in. long, strongly 5-nerved. Fl. B. I. v. 7, p. 328; Trim. Fl. Ceyl. v. 5, p. 299; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 441.—Flowers: Nov.

GUJARAT: Porbandar (Kathiawar), Bhiva! SIND: Stocks!-Distrib. Ceylon, Arabia, East Tropical Africa.

53. DIPLACHNE, Beauv.

Tall tufted perennial (?) grasses; stems erect or ascending, stout or slender, simple or sparingly branched. Leaves flat or convolute, narrow, Spikelets few- or many-flowered, sessile, 1-seriate on the slender spike-thke branches of a contracted subsimple erect panicle, not articulate at the base, strongly laterally compressed; rhachilla articulate between the flowering glumes, not produced beyond the uppermost neuter. Involglumes unequal, membranous, 1-nerved, obtuse, persistent; floral-glumes rather longer, elliptic-oblong, 1-3-nerved, the tip 2-4-toothed, mucronate or awned; palea linear. Lodicules 2, broadly cuneate. Stamens 3; anthers short. Styles short, distinct, with distant bases and short plumose laterally exerted stigmas. Grain oblong, stipitate, concave-convex, free in the glumes,—Distrais. Species about 20, in warm regions.

1. Diplachne fusca, Beauv. Agrost. (1812) p. 163. Stems tufted, 2-4 ft. high, stout, erect or geniculately ascending, simple or branched (sometimes proliferously), torete, polished, with long internodes. Leaves 0-10 by for in., flat or convolute, strict, erect, smooth, finely acuminate; sheaths smooth, the mouth truncate (not nuricled); ligule oblong, membranous, lacerate. Panicle 6-12 in. long, erect, narrowly oblong; rhachis smooth; branches spike-like, the lower 1-4 in. long. Spikelets erect, rather distant, 1-1 in. long, linear-oblong, 4-10-flowered; rhachilla slender; pedicels short. Lower invol.-glume 1 in. long, oblong-lancoolato; upper invol.-glume nearly 1 in. long, ovate-oblong, subacute, broader than the lower; floral glumes & in, long (including mucro), elliptic, thinly coriaceous, 3-nerved, the tip 2-toothed, mucronato by the produced midrib; palea oblong, obtuse, the keels silkily hairy. Anthers 1 in. long. Fl. B. I. v. 7, p. 329; Trim. Fl. Ceyl. v. 5, p. 300; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 441; Prain, Beng. Pl. p. 1225.

Konkan: Matunga near Bombay in rice-fields, Woodrow, 10!—Distrit. India (upper Gangetic plam, Bengal, W. Peninsula); Coylon, Egypt, Tropical Asia, Africa, and Australia.

54. GRACILEA, Kon.

Small tufted grasses. Leaves short. Spikelets 2-flowered, collected in turbinate fascicles which are secund, sessile and articulate on a slender spike. Spikelets not articulate at the base; rhachilla usually produced beyond the upper glume, filiform, scaberulous; callus 0. Glumes 4; invol.-glumes elongate-subulate, rigid, ciliate at the base and ending in rigid scabrid awns, persistent, collateral at base and laterally attached to base of spikelet; lower without hyaline margins;

the upper with rather wide ones, lower floral glume 2-sexual, chartaceous, ovate-oblong, cymbitorm, shortly awned, 3-nerved, the paler as long as the glume, 2 cuspidite and with scaberulous keels, the lodicules minute, cuneiform, truncate, upper floral glume like the lower, but much smaller, bicuspidate, male; sometimes an imperfect flower of 2 empty glumes at the end of the rhachilla. Stamens 3; anthers of 2-sexual flowers large, of male flowers small. Styles tree; stigmas slender, with short simple hairs, laterally exserted. Grain linear-oblong, free within the glumes.—Distrib. Species 2, Indian and African.

1. Gracilea Royleana, Hook f. in Fl. B. I. v. 7 (1896) p. 284. Annual; stems 3-8 in. high, densely tufted, very slender. Leaves 1-2 in. long, scarcely reaching $\frac{1}{15}$ in. broad, flat or convolute, linear-lanceolate, acutely pointed, glabrous or nearly so, the margins chlate; sheaths with a few long scattered hairs; ligule a hairy ridge. Spikes filiform, $\frac{1}{2}$ -2 in. long, flexuous, often recurved; thachis 3-gonous, smooth. Clusters of spikelets $\frac{1}{4}$ - $\frac{1}{3}$ in. long (including the awns), green or purple; awns of invol.-glumes longer than the glumes, awn of floral glumes short. Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 440; Prain, Beng. Pl. p. 1226. Melanocenchris Royleana, Nees, in Proc. Linn. Soc. v. 1 (1841) p. 95 (nomen nudum); Lisbot, in Journ. Bomb. Nat. v. 7 (1893) p. 370. M. Jacquemontii, Jaub. & Spich, Illustr. Pl. Or v. 4 (1850–1853) p. 36, t. 325. M. Rothiana, Dalz. & Gibs. Bo. Fl. p. 297 (not of Nees).

Konkan: Law', Woodlow Decen near Poons, Jacquemont, 383' S M Country. Belgaum, Stocks', Ritchie, 831'—Distrib India (Behar, Ruput in a, W Peniusula), Socotra, Nubia

VAR. plumosa, Hook f. Fl. B. I. (l. c) p. 284. Clusters of spikelet-larger, ½ in. long, including the awns. Melanocenth is plumosa, Jaub. & Spach, Illustr. Pl. Or. v. 4 (1850-1853) p. 37.

SIND, Stocks, 646', Jemadar ka Landa near Karachi, Stocks, 646'-Distrib. India (the Panjab), Arubia, Abyssinia

55. MICROCHLOA, R. Br.

Slender usually perennial grasses. Leaves narrow, often subsetaceous; ligule a minutely chate rim. Spikelets 1-flowered, small, sessile, umlateral, crowded on the flattened rhachs of a solitary terminal slender curved spike, alternately 2-senate from near the margins of the rhachs or in a single row; rhachilla disarticulating above, the invol-glumes more or less produced. Floret hermaphrodite. Glumes 3, involglumes subpersistent, strongly 1-nerved. flattened on the back or keeled, subequal; floral glume small, oblong, hyaline, awnless; palea nearly equalling the glume, 2-keeled. Lodicules 2, cuieate, glabrous. Stamens 3; anthers linear. Styles distinct; stigmas plumose, laterally exserted. Grain oblong, glabrous, free within the glumes.—Distinib. Species 7, one widely distributed throughout the Tropics, 3 in Africa, 3 in Australia.

1 Microchloa setacea, R. Br. Prodr. (1810) p. 208. Perennial; stems tutted, 2-6 (rarely reaching 10) in. high, very slender, branched or almost simple, compressed below, glabrous, smooth. Leaves \(\frac{1}{2}-1\frac{1}{2}\) in.

long, crowded at the base, subsetaceous with an acute or callous point, plicate, firm, the lower often curved, usually glabrous. Spike solitary, 1-3 in. (rarely reaching 6 in.) long; very slender, usually curved, often purplish; rhachis minutely ciliate. Spikelets 1-flowered, dorsally compressed, in a single row, $T_2 = \frac{1}{5}$ in. long, erect glabrous. Invol.-glumes subequal, lanceolate-oblong, acute or acuminate; floral glume up to T_3 in. long, abruptly and shortly acuminate, sometimes mucronulate, hairy along the nerves; palea ciliate on the nerves. Anthers about T_3 in. long. Grain oblong, subfusiform, T_3 in. long, smooth. Fl. B. I. v. 7, p. 283; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 440; Prain, Beng. Pl. p. 1226. Rotthodlia setacea, Roxb. Fl. Ind. v. I (1832) p. 357; Cor. Pl. v. 2, t. 132.—Flowers: Aug.

S. M Country : Dharwar, Woodrow,

Usually a very small plant growing on old walls. It rarely exceeds 3 inches high, though occasionally, under favorable conditions, it grows higher.—Distrib. Tropics of the Old and New World.

56. CYNODON, Pers.

Perennial glabrous grasses; stems creeping, rooting at the nodes and counting from them fascicles of barren shoots and flowering stems. Spikes 2 6, in terminal umbels. Spikelets 1-flowered, laterally compressed, sessile, imbricate, alternately 2-seriate and unilateral on a slender keeled rhachis; rhachilla disarticulating above the invol.-glumes, produced or not beyond the floral glume. Floret hermaphrodite. Invol.-glumes narrow, keeled, acute or subulato-mucronate, the upper usually deciduous with the floral glume, the lower subpersistent; floral glume exceeding the invol.-glumes, navicular, firmly membranous 3-nerved, awnless, the keel ciliate; palea somewhat shorter than the glume, 2-keeled. Lodicules 2, minute, obovate-cuncate, glabrous Stamens 3. Ovary glabrous; styles distinct, slightly shorter than the plumose stigmas. Grain oblong, subterete, free within the glumes.—Distrib. Species 2, of which 1 occurs in S. Africa, the other almost cosmopolian.

1. Cynodon dactylon, Pers. Syn. v. 1 (1805) p. 85. Stem slonder prostrate, widely creeping, forming matted tufts, with slender erec or ascending flowering branches 3-12 in. high. Leaves \(\frac{3}{4}-4\) by \(\frac{1}{2}\)0\(\frac{1}{2}\) in. narrowly linear or lanceolate, finely acute to pungent, more or les glaucous, soft, smooth, usually conspicuously distichous in the barrer shoots and at the base of the stems; sheaths tight, glabrous or hairy sometimes bearded at the mouth; ligule a very fine ciliato rim. Spike 2-6, radia ing from the top of a slender peduncle, 1-2 in. long, green or purplish; rhachis slender, compressed or angled, scaberulous. Spike lets \(\frac{1}{15}-\frac{1}{10}\) in. long; rhachilla produced, very slender, equalling \(\frac{1}{2}\) th length of the spikelet. Invol.-glumes lanceolate, acute to subulate mucronulate, the lower \(\frac{1}{25}-\frac{1}{10}\) in. long, the upper slightly longer; flora glume obliquely oblong to semiovate, about \(\frac{1}{12}\) in. long. Anther oblong, \(\frac{1}{25}\) in. long. Grain \(\frac{1}{2}\)1 in. long. It. B. f. v. 7, p. 288 Dalz. & Gibs. p. 297; Trim. Fl. Ceyl. v. 5, p. 274; Lisboa, in Journ Bomb. Nat. v. 7 (1893) p. 365; Woodr. in Journ. Bomb. Nat. v. 1 (1901) p. 440; Prain, Beng. Pl. p. 1227; Watt, Diet. Econ. Proc

v. 2, p. 678. Panicum dactylon, Linn. Sp. Pl. (1753) p. 58; Grah. Cat. p. 236.—Vern. Hariáli.

The well-known Hariali grass of the Deccan, extensively used as fodder in the Bombay Presidency.—Distrin. Throughout India, Birma, and Ceylon, ascending to 5000 ft. in the Himalayas; most warm countries.

57. CHLORIS, Sw.

Annual or perennial grasses. Leaves flat or convolute. Spikes solitary or several, in terminal umbels or short racemes, erect or stellately spreading. Spikelets of 2-4 florets (1 only or rarely more fertile), sessile, crowded, unilateral, 2-seriate on a slender rhachis; rhachilla disarticulating above the invol-glumes, more or less produced; lowest floret hermaphrodite, the second male or barren (rarely fertile), the following if present barren, often minute (some occasionally fertile in C. tenella). Involucral glumes 2, persistent, narrow, keeled, membranous, 1-nerved, acute, mucronate or the upper awned. HERMA-PHRODITH PLORET: floral glume narrow or broad, 3-nerved, acute or obtuse, minutely 2-toothed, usually awned from below the apex, often ciliate; palea almost equalling the glume, 2-keeled. Lodicules 2, minute. Stamens 3. Ovary glabrous; styles distinct, short; stigmas laterally exserted. MALE FLORET: glume and palea as in the hermaphrodite flower but smaller and glabrous. RUDIMENTARY PLORETS glabrous, awned or awnless, small to minute, usually without a trace of a palea.—Distrib. Species 40-45, in tropical and subtropical regions of both hemispheres.

Annual; spike solitary; spikelets cuneate, 3-awned; glumes 5-6; glume of hermaphrodite floret cuneate, the upper margin naked

Perennal; spikes 1-3; spikelets obconic, 4-awned, glumes 5; glume of hermaphrodite floret broadly ovate, with broad hyaline margins, hirsuit all over

Perennial; spikes 4-6, in terminal whorls; spikelets narrowly fusiform; glumes 4, the uppermost uninte on the produced rhachilla; glume of hermaphrodite floret oblong-lanceolate.

Perennial; spikes 5-20 in a truncate fascicle; spikelets 3-awned; margins of glume of hermaphrodite floret densely bearded above the middle, not hyaline

1. C. tenella,

2. C villosa.

3. C. incompleta.

4. C. barbata.

1. Chloris tenella, Roxb. Fl. Ind. v. 1 (1832) p. 329. Annual, very slender; stems 10-18 in. long, weak, slender, branched from the base. Leaves 3-8 by $\frac{1}{8}-\frac{1}{4}$ in., flaccid, linear-lanceolate, finely acuminate, the margins more or less ciliate towards the base; sheaths glabrous; ligule large, membranous, truncate. Spike solitary, 1-2 in. long, erect, flat. Spikelets large, reaching 1 in. long, cuneate, bifarious, 3-awned. Glumes 5 or 6; lower invol.-glume in long, strongly 1-nerved; upper invol.-glume longer and broader, with a strong midnerve which is produced into a short awn; glume of hermaphrodite floret 1 in. long, broadly cuneate, the upper margin truncated, naked, and with a scaberulous awn \frac{1}{6} in. long from the back below the apex, the palea elliptic with ciliate margins, and the callus densely hairy, the next or second floral glume smaller but similar, with a similar palea, the others still smaller fan-shaped awned. Sometimes one or more of the normally infertile glumes are found to be fertile, at other times all are barren; both forms may be found among the specimens in Herb. Kew. Fl. B. I. v. 7, p. 290; Dalz. & Gibs. p. 296; Lishoa, in Journ. Bomb. Nat. v. 7 (1893) p. 368; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 440.

DECCAN: Bijapur, Woodrow. Gusunat: Surat on the city walls, Dalzell! Sist: Jennadar ka Landa near Karachi, Stocks!—Distrib. India (W. Peninsula); Arabia, Abyssinia.

2. Chloris villosa, Pers. Syn. v. 1 (1805) p. 87. Perennial, stout; stems 6-10 in. long from a densely tufted stout woody base, clothed with equitant leat-sheaths. Leaves 1-3 by 1 -10 in., linear, acute, flat, convolute or twisted, rigid; ligule obscure. Spikes 1-3, erect, pale yellow, 11-21 by 3-1 in. Spikelets in long, obcome, with 4 unequal awns. Glumes 5; lower involugium in long (including a short awn), oblong-lanceolate, hyaline; upper invol.glume h in. long, oblong, hyaline, 2-toothed at the tip and shortly awned; glume of the hermaphrodite floret & in. long, broadly ovate or suborbicular, concave, with an awn & in. long or more, and broad hyalino margins bounded by the lateral nerves, hirsute all over with long silky hairs which are much longer than the glume, the palea elliptic-oborate with ciliate margins, hyaline; the next glume (4th) barren, about I as long, also hirsute, the next (5th) small, cuneate, the 6th reduced to an awn. Fl. B. I. v. 7, p. 291; Woodr, in Jonen. Bomb. Nat. v. 13 (1901) p. 440. Chloris tetrapogon, Beauv. Agrost. (1812) p. 158. Tetrapogon villosus, Desf. Fl. Atlant. v. 2 (1798) p. 389, t. 255.

Sind: Stocks, 611'-Distain. India (Panjah, Rajputani), westward to the Canaries.

3. Chloris incompleta, Rath, Nov. Pl. Sp. (1821) p. 60. Perennial; stems procumbent, or erect when growing amongst bushes, reaching a height of 5 ft., ending in a very long naked pedancle. Leaves 6-12 by 1-1 in., narrowed into a fine point, flat, glabrous or slightly hairy; sheaths long, smooth, the mouth hairy; ligule of long hairs. Spikes 4-6, in terminal whorls, 4-9 in. long; rhachis filiform, scabrid. Spikelets in. long (excluding the awns), narrowly fusiform, imbricating, erect, closely appressed; rhachilla slender, bearing To in. from its base a futt of hairs, a little above which is a barren glume terminated by a long awn reaching in. long. Glumes 4; lower invol.-glume 10 in. long, lanceolate, acute; upper invol.-glume 1 in. long (excluding awn), narrowly lanceolate, membranous, 2-toothed at the apex, with a strong midneric which is produced into an awn $\frac{1}{26}$ in. long; floral glume of fertile floret as long as the upper invol.-glume, oblong-lanceolate, 2-toothed at the apex, with an awn in long; palea as long as the glume, acuminate; callus bearded; fourth glume small, rudimentary. Sir J. Hooker (Fl. Ceyl. v. 5, p. 275) describes the barren 4th glume as a swelling of the rhachilla which it much resembles. Fl. B. I. v. 7, p. 290; Trim. Fl. Ceyl. v. 5, p. 275; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 440; Prain, Beng. Pl. p. 1227. Chloris digitata, Stend. Syn. Gram. (1855) p. 207; Lisboa, in Journ. Bomb. Nat. v. 7 (1893) p. 369: Melica digitata, Roxb. Fl. Ind. v. 1 (1832) p. 326; Grah. Cat. p. 236.—Flowers: Feb.

Konkan: Thana, Lisboa. Decen: Nasik, Lisboa. Kinna: (N. Kanara), Woodrou. - Distan. Throughout the plains of India, Ceylon, Afghanistan, China.

v. 2. p. 678. Panicum dactylon, Linn. Sp. Pl. (1753) p. 58; Grah. Cat. p. 236.—Vnrn. Hariáli.

The well-known Hariali grass of the Deccan, extensively used as fodder in the Bombay Presidency.—Distrin. Throughout India, Birma, and Ceylon, ascending to 5000 ft, in the Himalayas; most warm countries.

57. CHLORIS, Sw.

Annual or perennial grasses. Leaves flat or convolute. solitary or several, in terminal umbels or short racemes, erect or stellately spreading. Spikelets of 2-4 florets (1 only or rarely more fertile), sessile, crowded, unilateral, 2-seriate on a slender rhachis; rhachilla disarticulating above the invol.-glumes, more or less produced; lowest floret hermaphrodite, the second male or barren (rarely fertile), the following if present barren, often minute (some occasionally fertile in C. tenella). Involucral glumes 2, persistent, narrow, keeled, membranous, 1-nerved, acute, mucronate or the upper awned. Herma-PHRODITE FLORET: floral glume narrow or broad, 3-nerved, acute or obtuse, minutely 2-toothed, usually awned from below the apex, often ciliate; palea almost equalling the glume, 2-keeled. Lodicules 2, minute. Stamens 3. Ovary glabrous; styles distinct, short; stigmas laterally exserted. Male florer: glume and palea as in the hermaphrodite flower but smaller and glabrous. RUDIMENTARY FLORETS glabrous, awned or awnless, small to minute, usually without a trace of a palea.—Distrib. Species 40-45, in tropical and subtropical regions of both hemispheres.

Annual; spike solitary; spikelets cuneate, 3-awned; glumes 5-6; glume of hermaphrodite floret cuneate, the upper margin naked

Perennial; spikes 1-3; spikelets obconic, 4-awned; glumes 5; glume of hermaphrodite floret broadly ovate, with broad hyaline margins, hirsute all over

Perennial; spikes 4-6, in terminal whorls; spikelets narrowly fusiform; glumes 4, the uppermost minute on the produced rhachilla; glume of hermaphrodite floret oblong-lanceolate.

Perennial; spikes 5-20 in a truncite fascicle, spikelets 3-awned; margins of glume of hermaphrodite floret densely bearded above the middle, not hyaline

- 1. C. tenella.
- 2. C. villosa.
- 3. C. incompleta.
- 4. C. barbata.
- 1. Chloris tenella, Roxb. Fl. Ind. v. 1 (1832) p. 329. Annual, very slender; stems 10-18 in. long, weak, slender, branched from the base. Leaves 3-8 by $\frac{1}{8}$ - $\frac{1}{4}$ in., flaccid, linear-lanceolate, finely acuminate, the margins more or less ciliate towards the base; sheaths glabrous; ligule large, membranous, truncate. Spike solitary, 1-2 in. long, erect, flat. Spikelets large, reaching 1 in. long, cuneate, bifarious, 3-awned. Glumes 5 or 6; lower invol.-glume $\frac{1}{6}$ in. long, strongly 1-nerved; upper invol.-glume longer and broader, with a strong midnerve which is produced into a short awn; glume of hermaphrodite floret 1 in. long, broadly cuneate, the upper margin truncated, naked, and with a scaberulous awn \frac{1}{6} in, long from the back below the apex, the palea elliptic with ciliate margins, and the callus densely hairy, the next or second floral glume smaller but similar, with a similar palea, the others still smaller fan-shaped awned. Sometimes one or more of the normally infertile glumes are found to be fertile, at other times all are barren; both forms may be found among the specimens in

1. Tripogon pauperculus (by misprint pauperulus), Stapf, in Hook. Icon. Pl. t. 2442 (1896). Dwarf, 2-2½ in. high, annual, glabrons; stems capillary, densely tufted, leafy to the tip. Leaves setaceous, acute, ½-1 in. long, involute; sheaths, the lowest lax, the uppermost close, striate; ligule membranous, ovate, obtuse. Spikelets 2-3, remote (distant more than their own length from each other), or solitary at the apex of the stems, ½ in. long (excluding the awns). Lower invol.-glume ¼ in. long, symmetrical, narrowly lanceolate, 1-nerved, very acute; upper invol.-glume ¼ in. long, lanceolate, cuspidately aminate; floral glumes 4-1, with one or two empty above them, ½ in. long (excluding the awn), linear-oblong, 3-nerved, the lateral lobes with capillary awns; median awn geniculate, twisted below the knee, nearly ½ in. long; palea oblong with ciliolate keels. Anthers 3, minute, subglobose. Grain narrowly linear, cylindric. Fl. B. I. v. 7, p. 285; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 440.—Flowers: Sept.

Konkin: Stocks! Diccin: on the crest, of the Western Ghuts (1800 ft.), 8 miles S. of Lanch, on Ficus glomerata, in company with mosses and Utricularia orbiculata, Woodraw, 25!; on rocks near Karli (Poona districts), Woodraw!—Distrib. India (W. Peninsula).

2. Tripogon capillatus, Jaub. & Spach, Illustr. Pl. Or. v. 4 (1850-53) p. 47, t. 332. Whole plant 6-18 in. high; stems densely tufted, erect or geniculately ascending, subfiliform, smooth. Leaves rigid, green, convolute, the radical leaves very short or reduced to sheaths, the cauline erect, elongate, 6-8 by & in., narrowly linear, finely pointed; sheaths glabrous, striate; ligule reduced to a ridge. Spikes 5-12 in. long, filiform or capillary, flexuous. Spikelets 3-4-flowered, distant (\frac{1}{2}\) in. apart or more) along the rhachis of the spike, with many slender long awns. Invol.-glumes lanceolate, thinly membranous; lower invol. glume \frac{1}{16}\) in. long, cuspidately acuminate; upper invol.-glume \frac{1}{2}\) in. long (including a short awn); floral glume \frac{1}{2}\) in. long, ovate-lanceolate, 2-cleft at the apex, the lobes slender, shortly awned, the median awn reaching \frac{1}{2}\) ii. long or more; palea as long as its glume, marrow, oblanceolate-oblong, hyaline. Anthers \frac{1}{16}\) iii. long. Fl. B. L. v. 7, p. 285; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 440; Prain, Beng. Pl. p. 1229.—Flowers: Sept.

Konhan: Stocks!, Law!; on trees at Matheran, Woodrow, 17!, Lisboa. Deceas: on trees about Poona, Jacquemont, 580! S. M. Counter: Belgaum, on trees on Samboti Hill, Ritchie, 866!—Distain, India (Bellur, W. Peninsula).

3. Tripogon Lishoæ, Stapf, in Kow Bull. (1892) p. 84. Perennial, 2-3 ft. high; stem stout or slender. Leaves 12-24 by $\frac{1}{4}-\frac{1}{2}$ in., rigid, quite smooth, flat or convolute; sheaths glabrous; ligule obsolete. Spikes 6-10 in. long, narrow. Spikelets usually densely crowded, $\frac{1}{4}-\frac{1}{2}$ in. long, 5-12-flowered. Glumes coriaceous; invol.-glumes very unequal; lower invol.-glume $\frac{1}{1}$ in. long, 'lanceolate, acute; upper invol.-glume $\frac{1}{6}$ in. long, with a single tooth or unequally 2-toothed at the apex; floral glumes $\frac{1}{6}$ in. long, ovate, shortly 2-toothed at the apex; the lobes not awned, but with a slender awn about $\frac{1}{3}$ in. long from the sinus; palea oblong, obtuse, shortly 2-fid. Grain narrowly oblong, terete, glabrous. Fl. B. I. v. 7, p. 286; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 440.

Lisboa without locality in Herb. Kew.! Konnan: Stocket, Law! Decean: Kach between Poona and Limeli, Jacquemont, 581!--Distrib. India (Rajputana).

4. Tripogon Jacquemontii, Stapf, in Kew Bull. (1892) p. 85. Perennial, 1-2 ft. high. Leaves filiform, 2-8 in. long, convolute, glabrous. Spikes 4-8 in. long, narrow. Spikelets \(\frac{1}{3}-\frac{3}{4}\) in. long, narrow, oblong, 10-20-flowered. Glumes subcoriaceous, the uppermost empty; invol.-glumes very dissimilar; lower invol.-glume \(\frac{1}{6}\) in. long, acute, with a large projecting blunt tooth or lobe at one side extending \(\frac{1}{2}\) way up; upper invol.-glume \(\frac{1}{6}\) in. long, lanceolate-oblong, acute; floral glume \(\frac{1}{6}\) in. long, elliptic, shortly 2-fid at the apex, without lateral awns but with a median awn \(\frac{1}{2}\) in. long. Grain narrowly oblong, terete, glabrous. Fl. B. I. v. \(\frac{7}{6}\), p. 286; Lisboa, in Journ. Bomb. Nat. v. 7 (1893) p. 371; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 440.

Konkan: Bombay districts without precise locality, Lisheat; Matheran, Woodrow, 16: Drecan: Woodrow, 79:: Poona, Jacquemont, 353!, Woodrow!; Sholapur, Pinvill!; near Ahmedingar, Mis Shatvek!—Distrib. India (Bengal, Central India, W. Peninsula).

59. ELEUSINE, Gærtn.

Annual or percanial grasses. Leaves long or short. Spikelets 3-12-flowered (flowers all perfect except the terminal), sessile, 2-3-seriate and secund, forming digitate capitate or whorled spikes laterally compressed not jointed at the base; rhachilla continuous between the flowering glumes. Glumes few or many, keeled: invol.-glumes shorter than the floral ones, subequal or unequal, persistent; lower invol.-glume ovate or lanceolate; upper invol.-glume lanceolate, acute or acuminate, or broadly ovate or didymous, with a short stout recurved awn; floral glumes like the involucral, 3-nerved; palea complicate, strongly 2-keeled. Lodicules 2, cuncate. Stamens 3; anthers short. Styles short, free; stigmas slender, laterally exserted. Grain small, free; pericarp hyaline, loose. Seed rugose.—Distrib. Species about 7, in most warm countries.

1. Eleusine indica, Garta. Fract. v. 1 (1788) p. 8. Annual, erect; stem 1-2 ft. high, tufted, slightly compressed, glabrous; roots of strong fibres. Leaves distichous, flat or folded, as long as the stem, $\frac{1}{10} - \frac{1}{10}$ in. broad, linear, glabrous or sparsely hairy, with nearly smooth margins; sheaths compressed, the mouth not anxieled but often with a few hairs; ligule a thin slightly hairy membrane. Spikes 2-7 or more, 2-5 inlong, with sometimes one or two detached spikes below the umbel, digitate, subsercet or slightly recurved, the axils hairy and glandular; rhachis flattened. Spikelets pointing forward at an acute angle with the rhachis of the spike, variable in size, $\frac{1}{10} - \frac{1}{10}$ in. long, 3-6-flowered, glabrous. Invol.-glumes unequal, membranous; lower $\frac{1}{10}$ in. long, ovate-oblong, acute, 1-nerved; upper $\frac{1}{10}$ in. long, ovate-oblong, subacute, very shortly apiculate, with 3-7 green nerves; floral glumes gibbously ovate-oblong, obtuse, $\frac{1}{10}$ in. long; palea shorter than the glume, oblong-lanceolate, subacute. Authers $\frac{1}{10}$ in. long. Grain oblong, obtusely

trigonous, obliquely striate, reddish-brown. Fl. B. I. v. 7, p. 293; Grah. Cat. p. 235; Trim. Fl. Ceyl. v. 5, p. 277; Lisboa, in Journ. Bomb. Nat. v. 7 (1893) p. 375; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 440; Prain, Beng. Pl. p. 1229; Watt, Diet. Econ. Prod. v. 3, p. 241.—Flowers: Jan. Veen. Mahar-nachni.

Throughout the Presidency, Lishon. Dicens: Poona, Woodrow. - Disput. Throughout the plants of India; Ceylon, Tropics of the Old World.

2. Eleusine flagellifera, Necs, in Linnæa, v. 16 (1842) p. 220. Perenmal, prostrate, problerously branched, glaucous; stems smooth, stiff, widely spreading, rooting at the distant thickened leafy nodes and souding up slender branches; internodes 4-8 in, long.' Leaves ½-1½ by ½-½ in., linear-lanceolate, acummate, rigid, distant, flat or fortuous, recurved, the upper very short; sheaths glabrous; ligule a hairy line. Spikes 3-6, digitate, ½-1½ by ½-½ in.; rhachis slender, flexuous, pubescent. Spikelets imbricate, subsessile or very shortly pedicellate, 4-6-flowored, ½-½ in, long. Lower invol-glume rather less than ½ in, long, ovate, acute, membranous; upper invol.-glume ¼ in, long, lanceolate, aristate, coriaceous, with broad membranous margins; floral glumes ½ in, long, ovate, acute, apiculate, chartaceous, 3-nerved, the midnerve compound, the margins membranous, hairy below; palea oblong with ciliate keels. Anthers ¼ in, long. II. B. I. v. 7, p. 294; Duthie, Fodd. Grass, N. Ind. p. 57; Lasboa, in Journ. Bomb. Nat. v. 7 (1893) p. 377; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 440; Watt, Diet. Econ. Prod. v. 3, p. 211.

Dicens: Peona, Liston, Khundesh, Liston, Sinn: Dalzell!, Stocks, 765!—Distrib. India (Panjab, W. Peninsulu); Afghanistan, N. Africa.

3. Eleusine ægyptiaca, Desf. Fl. Atlant. v. 1 (1798) p. 85 (agyptia). Annual of variable habit, 1 12 ft. high: stems sometimes prostrate, rooting from the proliferously branched nodes, geniculately ascending, compressed, glabrous, smooth. Leaves linear, 1-5 by 1,-I in , tapering to a fine point, flat, glaucous, glabrous or hairy or hispidly ciliate with bulbous-based hairs; ligule a slightly ciliolate line. Spikes 2-6, digitately radiating, 1-11 in. long; rhachis trigonous or dorsally flattened, rigid, often excurrent into a pungent mucro. Spikelets many, 3-5-flowered, spreading at right angles to the chachis, up to 1 in. long. Glumes divariente; lower invol.-glume ovate, acute, 12 in. long; upper invol. glame 1 in. long (excluding the awn), suborbicular, the midnervo produced into a usually curved awn often as long as or sometimes longer than the glume; floral glumes gibbously ovate, up to 1/2 in. long, mucronate or awned; palea rather shorter than its glume, ovate-oblong, obtuse or 2-fid. Anthers about 10 in. long. Grain subglobose, reddish, very rugose, $\frac{1}{15}$ in. in diam. Fl. B. I. v. 7, p. 295; Grab. Cat. p. 235; Trim. Fl. Ceyl. v. 5, p. 279; Lisboa, in Journ. Bomb. Nat. v. 7 (1893) p. 374; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 440; Prain, Beng. Pl. p. 1229; Watt, Diet. Econ. Prod. v. 3, p. 236. Dactyloctenium wyyptiacum, Willd. Enum. Hort. Berol. (1809). p. 1029; Dalz. & Gibs. p. 297.—Flowers: Sept.-Nov.

Korkay Ratingiri Woodrow, 41! Decean: Poona, Jacquemont, 399! and 4861; Sharanpur, near Nasik, Woodrow, S. M. Coustar: Badami, Woodrow, 12! Sixustocks, W3!!—Distrib. Widely spread throughout tropical and subtropical regions.

4. Eleusine aristata, Ehrenb. ex Boiss. Fl. Orient. v. 5 (1881) Perennial, slender, prostrate, proliferously branched; stem smooth, stiff, widely spreading, rooting at the distant thickened woody leafy nodes and sending up very slender branches 4-12 in. long; internodes 2-4 in. long. Leaves 1-4 by $\frac{1}{16}$ $\frac{1}{10}$ in., acuminate or pungent, glaucous, sparsely hairy, and the margins ciliate with bulbous-based hairs; sheaths glabrous or sparsely hairy; ligule obsolete. Spikes 3 or more, $\frac{1}{4}$ in, long, spreading or decurved, bearded at the base; rhachis excurrent into a pungent point. Spikelets about 1 in. long (including the awas). Lower invol.-glume 1 in. long, ovate, acute or apiculate, 1-nerved, with ciliate keel; upper invol.-glume 1 in. long (including an awn $\frac{1}{40}$ in. long), suborbicular; floral glumes nearly $\frac{1}{6}$ in. long, broadly ovate, acute, cuspidate, glabrous, keeled, membranous, with a strong midnerve and weak lateral nerves; palea broad, the keels scaberulous. Anthers $\frac{1}{20}$ $\frac{1}{12}$ in. long. Grain ovoid, rugose. Fl. B. I. v. 7, p. 296; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 440. Eleusine sindica, Duthie, Fodd. Grass. N. Ind. (1888) p. 58; Lisbon, in Journ. Bomb. Nat. v. 7 (1893) p. 377. Dactyloctenium sindicum, Boiss. Diag. sér. 2, fasc. 4 (1859) p. 131.

Konkan: Ratnagiri, Woodrow. Gujarat: Ahmedabad, Woodrow. Sind: Stocks, 637!; Mundgiro, Stocks, 637!—Distrib. India (Panjáb, Rajputana, W. Peninsula); Beluchistan, Afghanistan, Arabia, Nubia.

Eleusine coracana, Gærtn. Fruct. v. 1 (1788) p. 8, t. 1. Stem 2-5 ft. high, often as thick as the thumb; leaves broad; spikes stout, in. broad and reaching 6 in. long; grain globose. Only known in cultivation; very like Eleusine indica, from which it has probably originated. It is extensively grown in the hilly districts of the Bombay Presidency, and the grain is largely consumed by the poorer classes. Fl. B. I. v. 7, p. 294; Grah. Cat. p. 235; Dalz. & Gibs. Suppl. p. 97; Lisbon, in Journ. Bomb. Nat. v. 7 (1893) p. 373; Prain, Beng. Pl. p. 1229; Watt, Diet. Econ. Prod. v. 3, p. 237.—Vern. Nachni; Nagli.

60. DINEBRA, Jacq.

An annual leafy grass. Leaves flat. Spikelets 2-3-flowered, 2-seriate, secund and imbricating on short slender spreading or deflexed spikes collected in narrow pyramidal racemes, not jointed at the base; rhachilla slender, jointed at the base, produced beyond the flowering glumes and bearing an imperfect glume. Glumes 4-5; invol.-glumes persistent, much longer than the floral, lanceolate, awned, 1-nerved, keeled; lower invol.-glume shorter than the upper; floral glumes small, broadly ovate, subacute, hyaline, 1-nerved; palea hyaline, shorter than the glume, linear-oblong, obtuse, with finely ciliolate keels. Lodicules 2, minute. Stamens 3; anthers minute, didymous. Styles free, short; stigmas exserted at the apex of the glume, shortly penicillate. Grain narrowly ovoid, obscurely trigonous.—Distrib. India, W. Peninsula, Ceylon, Afghanistan, and westward to Senegal.

1. Dinebra arabica, Jacq. Fragm. (1809) p. 77. Stems 1-3 ft. high, tufted, stout or slender, erect or geniculately ascending, leafy

throughout; nodes glabrous. Leaves 3-8 by $\frac{1}{6}-\frac{1}{5}$ in., linear, finely acuminate, flaccid, glabrous or sparsely hairy, contracted at the insertion; sheaths thin, loose, glabrous; ligule a narrow lacerate membrane. Spikes $\frac{1}{2}-\frac{1}{2}$ in. long, racemosely arranged along the axis of an inflorescence 4-12 in. long, alternate, single or in fascicles of 2-3 together; rhachis dorsally flattened, ventrally trigonous. Spikelets $\frac{1}{5}$ in. long (including the awns), alternate, sessile. Invol.-glames lanceolate, hyaline, keeled, with slightly recurved minutely scaberulous awns, the lower invol.-glume shorter than the upper; floral glumes reaching $\frac{1}{10}$ in. long, ovate-oblong, subacute, white. Anthers $\frac{1}{10}$ in. long. Grain ellipsoid-oblong, trigonous, $\frac{1}{10}$ in. long, pale brown. Fl. B. I. v. 7, p. 297; Trim. Fl. Ceyl. v. 5, p. 280; Duthie, Fodd. Grass. N. Ind. p. 55; Lisboa, in Journ. Bomb. Nat. v. 7 (1893) p. 372; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 440; Prain, Beng. Pl. p. 1230; Watt, Dict. Econ. Prod. v. 3, p. 113. Leptochloa calycina, Kunth, Revis. Gram. v. 1 (1829) p. 91; Dalz. & Gibs. p. 296.—Flowers: Aug.

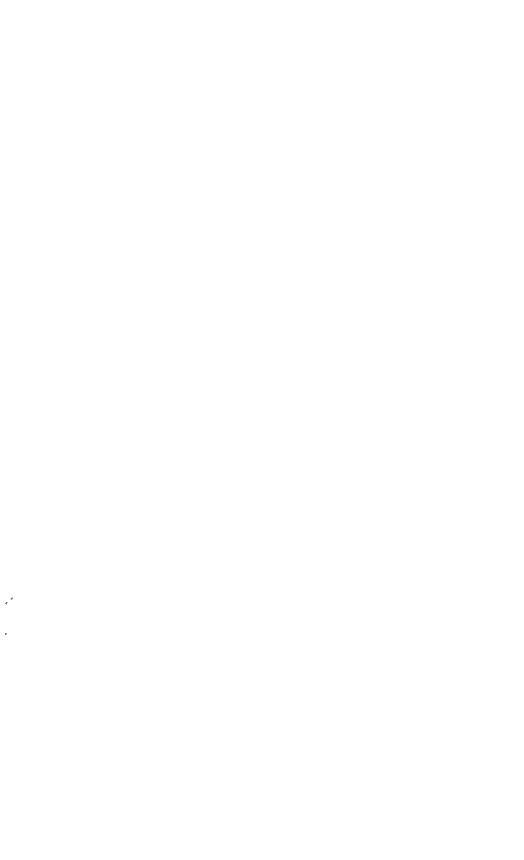

Konkan: Law!, Stocket Diccan; Poona, Woodrow, Gujarat; banks of the Tapti above Surat, Dalzell & Gilson; Surat, Woodrow, Morvi (Kathiawar), Woodrow, —Distrib. India (W. Peninsula); Ceylon, Afghanistan, and westward to Senegal.

61. ENNEAPOGON, Desv.

Perennial grasses. Leaves narrow, often convolute; ligules reduced to a line of hairs. Spikelets 3-flowered, in contracted or spike-like panicles; rhachilla disarticulating above the glumes; lowest floret hermaphrodite, the intermediate male or barren, the uppermost rudimentary. Invol.-glumes persistent, membranous, acute, obtuse or minutely truncate, 3-9-nerved. Hermaphrodith truncate; glume very broad, much shorter (excluding the awns) than the invol.-glumes, 9-nerved, 9-awned, the awns subulate, equal or subequal, plumose, ciliate, or scaberulous; callus minute, short; palea ovate-oblong, 2-keeled. Lodicules 2, minute, cuneate, fleshy. Stamens 3. Ovary glabrous; styles distinct, short; stigmas laterally exserted, plumose, Grain oblong. Intermediate trough like the lower, but the floral glume shorter, glabrous, the ovary rudimentary or suppressed. Uppermost property rudimentary or reduced to a tuft of hairs.—Distrib. Species about 6, in the dry warm regions of the Old World and in Australia; 1 species in Western N. America.

1. Enneapogon elegans, T. Cooke. Stem 3-18 in. high, slender, wiry, erect or ascending from a subwoody often thickened base; nodes often tomentose. Leaves \(\frac{1}{2}-5 \) in. long, usually convolute, pungently pointed, more or less softly pubescent; sheaths puberulous; ligule a line of hairs. Paniele 1-3 in. long; branches very short; rhachis villous. Spikelets with their awns up to \(\frac{1}{2} \) in. long or more, sessile and pedicellate, softly tomentose, nearly white. Lower invol.-glume \(\frac{1}{2} \) in. long, lanceolate, acute, 5-7-nerved; upper invol.-glume \(\frac{1}{2} \) in. long, lanceolate, acute, 7-nerved; glume of hermaphrodite floret orbicular below, cleft above into 9 subulate awn-like lobes which are plumose in the lower half; palea ovate, 2-keeled, the keels pubescent. Pappophorum elegans, Nees, in Wight, Cat. n. 1771 (1833); Fl. B. I. v. 7, p. 301; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 440.

Sian : Karachi district, Woodrow. - Distrib. India (Peshawar, Birma, W. Peninsula).

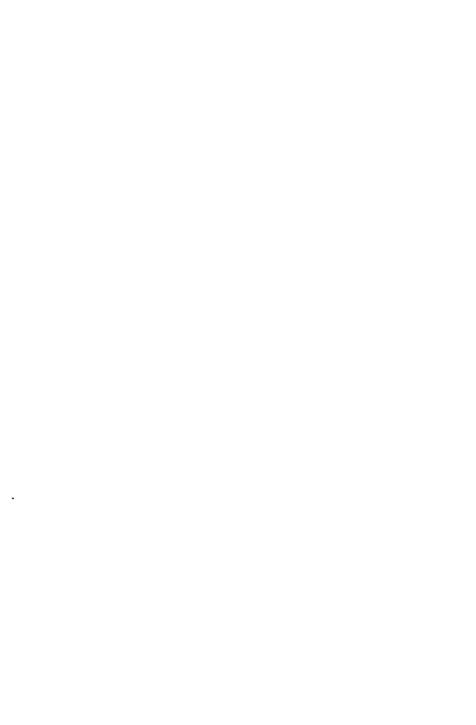

1. Leersia hexandra, Sw. Prod. Veg. Ind. Occ. (1797) p. 131. Perennial; stems rooting in the mud, with floating flexuous branches several feet long, sending up creet or ascending slender leafy branches 2-4 ft. high, usually slender and weak, smooth, striate; nodes hairy with deflexed hairs. Leaves 3-8 by $\frac{1}{3}$ - $\frac{1}{3}$ in., linear, tapering to a fine point, suberect, rather rigid, nearly glubrous, with scaberulous margins. base narrow; sheaths nearly smooth, glabrous, the margins eciliate: ligale short, obliquely truncate or 2-lobed, membranous. 2-4 in. long, pedunculate, oblong, laxly branched, narrow; rhachis filiform; branches filiform, flexuous, angular, smooth. Spikelets nearly ; in. long. Floral glume nearly ; in. long, evate-oblong, somewhat bont-shaped, acute, shortly mucronate, strongly keeled, ciliate on the keel and margins, 5-nerved, the lateral nerves forming a thickened margin; palea as long as the glume, linear-lanceolate, subacute. Fl. B. I. v. 7, p. 94; Trim. Fl. Ceyl. v. 5, p. 184; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 435; Prain, Beng. Pl. p. 1185; Watt, Diet. Econ. Prod. v. 4, p. 619. Leersia ciliata, Roxb. Fl. Ind. v. 2 (1832) p. 207 .-Flowers: Oct.

S. M. Couviny Londa, Gammie ex Woodrow.—Distrin. More or less throughout India, Coylon, Africa, America, Australia.

64. ORYZA, Linn.

Tall annual or perennial grasses. Leaves long, narrow, flat. Spikelets 1-flowered, loosely arranged on the branches of an elongate paniele, disarticulating above the 2 lowest glumes. Glumes 5; the 2 lower invol.-glumes below the articulation of the spikelet minute, scale-like (rarely absent): the 2 next invol.-glumes above the articulation of the spikelet subulate; floral glume solitary, dimidiate-oblong, coriaceous or chartaceous, 5-9-nerved, awnless or with a short or long straight terminal awn; palea linear or lanceolate, as long as the glume, 3-5-nerved, coriaceous, with membranous margins. Lodicules 2, entire or 2-lobed. Stamens 6; anthers linear. Style short, free; stigmas laterally exserted from the glume. Grain narrowly oblong, compressed, closely covered by or adnate to the glume and the palea.—Distrib. Species 5 or 6, tropical.

1. Oryza coarctata, Roxb. Fl. Ind. v. 2 (1832) p. 206. Stem 4-6 ft. high, erect from a stout creeping rhizome, smooth, hard and polished. Leaves 6-15 by \(\frac{1}{2}\) in., coriaceous, linear, caudate-acuminate, with spinulose margins; sheaths glabrous, polished, reticulate like basket-work; ligule very narrow, fringed with short hairs. Panicles 4-8 in. long, spike-like; rhachis and branches trigonous, stiff, smooth. Spikelets reaching \(\frac{5}{2}\) in. long (including the awn). Glumes 5, the outer (below the articulation of the spikelet) consisting of 2 opposite minute appressed rounded or truncate thick scales, one attached lower than the other; the 2 glumes above the articulation of the spikelet subulate, the lower of the pair \(\frac{1}{10}\) in., the upper \(\frac{1}{3}\) in. long. Floral glume solitary, \(\frac{5}{2}\) in. long, lanceolate, boat-shaped, rounded and with a large projecting wing on the back, cuspidate with a stout hard glabrous whife awn about \(\frac{1}{3}\) in. long, 7-9-nerved, the lateral nerve forming a thickened margin to the glume. Palea (upper floral glume of some authors) \(\frac{1}{2}\) in.

Journ. Bomb. Nat. v. 13 (1901) p. 141; Prain, Beng. Pl. p. 1217. Melica diandra, Roxb. Fl. Ind. v. 1 (1832) p. 327; Grah. Cat. p. 236.—Flowers: Oct.

KANABA: Kadgal (N. Kanara). -- Distatu. India (Himalayas, Khasia Hills, Gentral India, Birma); Ceylon, Malaya, China, Polynesia, Tropical Africa.

66. ELYTROPHORUS, Beauv.

An annual, erect, glabrous grass. Leaves very narrow, flat. Inflorescence of globose clusters of minute sessile spikelets crowded together in long continuous or interrupted catkin-like spikes (rarely on the short spike-like branches of a very contracted raceme). Spikelets short (many imperfect or reduced to empty glumes), strongly laterally compressed, not articulate at the base, 4-6-flowered; rhachilla very short, articulate at the base and between the flowering glumes, but not beyond the upper. Invol.-glumes subequal, lanceolate, aristately acuminate, hyaline, 1-nerved, glabrous or citiate, keeled; floral glumes rather longer, with a long awn, 3-nerved, with ciliate margins, the uppermost neuter; palea shorter than the glume, very broad, truncately 3-lobed, the lobes ciliate, keels distant, winged, smooth. Lodicules 2, obliquely oblong. Stamens 1-3; anthers minute. Styles free, long: stigmatic hairs very short. Grain minute, fusiform or narrowly oblong; pericarp loose at both ends .- DISTRIB. Tropical Asia, Africa, and Australia.

1. Elytrophorus articulatus, Beanv. Agrost. (1812) p. 67. Annual, 6-24 in. high; stems erect from a densely fibrous root, as thick as a crow-quill or less. Leaves longer or shorter than the stem, linear, acute, $\frac{1}{16}-\frac{1}{6}$ in. broad, smooth, flaccid, base narrow; sheaths membranous, loose; ligule small, membranous, lacerate. Inflorescence 6-12 in. long, often longer than the rest of the plant. Spikelets $\frac{1}{6}$ in. long (including awns), as broad as long. Lower invol.-glume $\frac{1}{10}$ inlong; upper invol.-glume $\frac{1}{8}$ in. long; floral glume (including awn) $\frac{1}{6}$ in. long, ovate-lanceolate; palea $\frac{1}{10}$ in. long, broadly oblong, truncately 3-lobed. Fl. B. I. v. 7, p. 306; Trim. Fl. Ceyl. v. 5, p. 288; Duthie, Fodd. Grass. N. India, p. 61; Lisboa, in Journ. Bomb. Nat. v. 7 (1893) p. 379; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441; Prain, Beng. Pl. p. 1218.—Flowers: Nov.—Feb. Vens. Jangli-rdla.

Konkun: Law!, Kalyan, Woodrow. S. M. Counter: Londa, Woodrow. Greener: Godra, Woodrow. District. More or less throughout India; Ceylon, Tropical Asia, Africa, and Australia.

67. ÆLUROPUS, Trin.

Low much-branched very rigid perennial leafy grasses. Leaves distichous, short, strict, usually convolute, coriaceous, pungent. Spikelets 6-many-flowered, minute, sessile, densely crowded in terminal villous heads, laterally compressed, not articulate at the base; rhachilla obscurely jointed at the base, not produced beyond the upper glume; internodes very short. Glumes many, oblong, membranous, apiculate, the margins and tips broadly hyaline. Invol.-glumes unequal, persistent; lower invol.-glume narrowly oblong, 1-3-nerved; upper invol.-

1. Oropetium Thomæum, Trin. Fund. Agrost. (1820) p. 98. Whole plant 2-3 in. high, forming hard tufts with capillary root-fibres; stems compressed. Leaves shorter or longer than the stems, erect or curved, filiform, acute, coriaceous, striate, sparsely ciliate with long hairs; sheaths membranous, compressed; ligule an creet lacerate membrane. Spikes 1-1} by 30 in., erect, straight or slightly curved; rhachis undulating, 4-gonous. Spikelets reaching 40 in. long, acute, 1-flowered. Lower invol.-glume minute, hyaline; upper invol.-glume 15 in. long, linear-lanceolate, rigid, recurved in fruit; floral glume 10 in. long, semicircular in profile, 2-fid, hyaline; callus bearded. Authers 20 in. long. Grain 30 in. long, somewhat fusiform, reddishbrown. Fl. B. I. v. 7, p. 366; Dalz. & Gibs. p. 300; Trim. Fl. Ceyl. v. 5, p. 271; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441; Prain, Beng. Pl. p. 1231.

On old walls, Lalzell & Gibson. Dicces: Poons, Woodrow; Junnar near Poons, Woodrow - Distrin. Throughout the plains of India; Ceylon.

69, BAMBUSA, Schreb.

Shrubs or trees usually large and caspitose (rarely climbing); stemsheaths broad, the blade often triangular. Leaves shortly petiolate, not tessellate by nervules but sometimes so by pellucid glands; sheaths variously auricled. Spikelets 1-flowered, usually arranged in a large leafless panicle bearing heads or spiciform branches, or in leafy panicles, or in paniculate spikes. Lower glumes 1-1, empty or bubblerous; flowering glumes ovate-lanceolate, the uppermost imperfect; palea 2-kceled. Lodicules 2 or 3, membranous, ciliate, rarely obsolete. Stamens 6, free. Ovary oblong or obovoid, with a hairy tip; styles short or long; stigmas 2-3. Grain oblong or linear-oblong, furrowed on one side; pericarp thin, adherent to the seed.—Distrib. Species about 50, Eastern Asia, 1 in Australia.

1. Bambusa arundinacea, Willd. Sp. Pl. v. 2 (1799) p. 245. Thorny; stems many, tutted on a stout rootstock, 80-100 ft. high by 6-7 in. in diam., usually graceful and curving; nodes prominent (the lowest rooting), the lower emitting horizontal, almost naked shoots armed at the nodes with 2-3 stout recurved spines sometimes 1 in. or more long; internodes up to 18 in. long; walls 1-2 in. thick; stemsheaths coviaceous, variable in shape, up to 12-15 by 9-12 in., striate, with rounded tip and plaited margins, when young orange-yellow streaked with green or red and thickly ciliate with golden hairs, blado up to 4 in. long, triangular, acuminato, glabrous outside, densely hirsuto inside, the margins decurrent, thickly ciliate; ligule narrow, entire or fringed with pale hairs. Leaves up to 7-8 by 1 in., linear or linearlanceolate, tip stiff, glabrous or puberulous beneath, one or more margins scabrous, base rounded, ciliate, midrib narrow, nerves 4-6 with 7-9 intermodiate and a few transverse pollucid glands; leaf-sheath ending in a thick callus and shortly bristly auriele; ligule short. Inflorescence an enormous paniele often occupying the whole stem; branchlets bearing loose clusters of pale, suberect, lanceolate, acute, glabrous spikelets 3-1 by 1 in. Invol.-glumes 2 or 0, ovate-lanceolate, acute or mucronate, 1-1 in long, many-nerved, empty; floral glumes 3-7, the uppermost

narrow, elongate, conical, 1-3-flowered, the uppermost usually fertile. Invol.-glumes 1-3, empty; floral glumes ovate, elongate, mucronate. Palea of lower florets 2-keeled, of upper florets convolute with obscure or obsolete keel. Lodicules 0. Stamens 6; filaments connate in an ultimately elongated membranous tube. Ovary ovoid; style slender; stigmas 1-3, more or less plumose. Grain elongate, beaked, grooved, smooth.—Distrib. Species 9, of which 8 are found in 8. India, Birma, and Malaya, the remaining 1 a native of Tropical Africa.

Spikelets 1-flowered, style glabrous; anthers bristly-apiculate. 1. O. monosligma. Spikelets 2 flowered; style hairy, anthers acute, not apiculate. 2. O. Stocksii.

1. Oxytenanthera monostigma, Bedd. For. Man. in Flor. Sylvat. (1873) p. ccxxxiii, et Icon, Pl. Ind. Or. (1874) p. 56, t. 234. A mediumsized bamboo; stems 10-15 ft. high by about 1 in. in diam., solid, covered with soft pale yellow velvety tomentum; nodes not very prominent; internodes long; stem-sheaths 6-9 in. long by 3 in. broad at the base, narrowed to the 2-lobed tip; blade in the sinus imperfect, about 3 in. long, linear-lanceolate, striate; ligule long, fimbriate. Leaves variable, pale green, 6-8 by 11 in., linear-lanceolate, acuminate, unequally rounded at the base into a flat petiole, ending above in a setaceous twisted point, glabrous or nearly so above, sparsely hairy and pale beneath; midrib below yellow, shining; nerves 7-12; leaf-sheaths striate; ligule often in. long, acute or rounded. Panicle large, terminal, of spicate branches bearing dense globular often large heads of spikelets up to 2½ in. in diam. Spikelets 1-1 in. long, less than 1 in. broad, 1-flowered, with a long spinous apiculation, very numerous, the fertile and sterile about equal in numbers. Invol.-glumes 2-3, mucronate, empty; floral glume long, narrow, linear-lanceolate, convolute, with a long mucro; palea shorter than its glume, concave, not keeled, obtuse. Stamens exserted; anthers long, bristly-apiculate, the bristle somewhat hairy at the tip. Style long, glabrous; stigma at length curved, thickened. Grain narrow, linear-oblong, grooved, tipped with the conic style-base. Fl. B. J. v. 7, p. 402; Gamble, Bamb. Brit. Ind. (1896) p. 74, t. 65; Talb. Trees, Bomb. ed. 2, p. 347; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 442.—Very. Choua.

Konkan: Ghâts, Tallot, Woodrow, Decean: Sâkhar-Puthâr bill noar Lanoli, Woodrow; Sattara Ghâts, Brandis; Mahableshwar, Fagan; Poona districts, Wroughton; Ahmedingar, Wilkins. S. M. Countur: Ritchie, 820. Kanana: N. Kunara, Woodrow, Talbot.—Distrib. India (W. Peninsula).

2. Okytenanthera Stocksii, Munro, in Trans. Linn. Soc. v. 26 (1868) p. 130. A slender bamboo; stems 30 ft. high by 1-1½ in, in diam., grey-green, covered when young with a white or grey deciduous tomentum; nodes with a softly pubescent ring; internodes 6-12 in. long; stem-sheaths 6-9 in. long by 3-7 in. wide at the base, tapering upwards to a concavely truncate top, appressedly brown-hairy on the back, ciliate on the margins; blade imperfect, subulate, acuminate, rounded at the base and again expanded into a rounded, waved, long-fringed auxiele on the top of the sheath; ligule \(\frac{1}{2}\) in. long, deeply imbriate, conspicuous. Leaves 4-8 by \(\frac{3}{4} - \frac{3}{4}\) in., rounded or attenuate at the base into a very short petiole \(\frac{1}{10}\) in. long, the top ending in a setaceous point, glabrous or nearly so above, glabrous or hairy below, with scabrous margins; midrib narrow; nerves 5-6; leaf-sheaths

striate, glabrous or at first pubescent; ligule long, dentate. Panicle large, of spicate heads reaching 1 in. in diam., with many closely packed spinous spikelets, the heads supported by rounded chaffy bracts. Spikelets \$\frac{3}{2}-\frac{1}{2}\$ in. long, narrow, glabrous, mucronate, many fertile mixed with a few sterile. Invol.-glumes 2, ovate, mucronate, 5-7-nerved, then 2 hermaphrodite florets; floral glumes ovate, subacute, with a strong mucro from the back; palea of the lower floret as long as the floret, 5-nerved between the 2 ciliate keels, obtuse, that of the upper short, acute. Ovary ovoid, hairy; style long, hairy; stigma simple, plumose. Fl. B. I. v. 7, p. 403: Bedd. For. Man. in Flor. Sylvat. pp. cexxxiii; Gamble, Bamb. Brit. Ind. (1896) p. 75, t. 66; Talb. Trees, Bomb. ed. 2, p. 348; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 442.

—Flowers: Nov. Vern. Chivari; Konda.

KONRAN: Stocks. Decean: Panchgani (planted), Woodrow. KANARA: Kumpta, Talbot; commonly cultivated along the coast; rare in the Ghát forests of N. Kanara, Talbot.—Distrib. India (W. Peninsula).

71. DENDROCALAMUS, Nees.

Arborescent unarmed bamboos with densely branching rootstocks. Leaves shortly petiolate, the transverse nervules represented by pellucid glands. Spikelets in globose clusters on the long branches of a compound panicle, ovoid, 2-6-flowered. Invol.-glumes 2-3, empty, ovate, acute, many-nerved; floral glumes like the empty; palea of lower florets keeled, of the upper dorsally rounded, eciliate. Lodicules rare. Stamens 6; filaments free. Ovary hairy above, often depressed; stigma usually simple. Grain small; pericarp coriaceous or crustaceous.—Distrib. Species 16; South-eastern Asia.

1. Dendrocalamus strictus, Necs, in Linnara, v. 9 (1834) p. 476. A deciduous densely tufted bamboo with strong stems 20-50 ft. high by 1-3 in. in diam., which are solid or only with a small eavity. glaucous-green when young, dull green or yellowish when old; nodes swollen, the lower often rooting; internodes 12-18 in, long; upper branches decurved; stem-sheaths variable, the lower 3-12 in. long, covered on the back with golden-brown stiff hairs (or in dry localities sometimes glabrous), striate, rounded on the top, ciliate on the margins, very slightly auricled, the imperfect blade triangular-subulate, hairy on both sides, especially so within; ligule narrow. Leaves 1-2 in. long in dry localities, up to 10 in. long in moist ones, 1-11 in. broad. rounded suddenly at the base into a short petiole, gradually narrowed upwards into an acuminate twisted point, rough and often hairy above, softly hairy beneath, with scabrous margins; nerves 3-6 pairs, with interposed pellucid glands; leaf-sheaths. striate, hairy, callus prominent, auricle short, ciliate with a few wavy deciduous hairs; ligule narrow, serrate. Inflorescence a large branching panicle of dense globular heads about 1 in. in diam., 12-2 in. apart; rhachis rounded, smooth. Spikelets usually hairy, spinescent, the fertile intermixed with many sterile smaller ones, $\frac{1}{3}$ by $\frac{1}{10}$ in., with 2-3 fertile florets. Involglames 2 or more, ovate, spinescent, many-nerved; floral glumes ovate, ending in a sharp spine, surrounded by ciliate tufts of hairs; palea. ovate or obovate, emarginate, the lower ones 2-keeled, the uppermost keelless, 6-8 nerved. Stamens long-exserted; anthers yellow, shortly apiculate. Ovary stipitate, turbinate; style long; stigma simple, plumose. Grain in long, ovoid to subglobose, brown, shining, hairy above, beaked with the persistent style-base. Fl. B. I. v. 7, p. 404; Bedd. Flor. Sylvat. t. 325, et For. Man. p. cexxxv; Gamble, Bamb. Brit. Ind. (1896) p. 78, tt. 68, 69; Talb. Trees, Bomb. ed. 2, p. 347; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 442; Prain, Beng. Pl. p. 1231; Watt, Diet. Econ. Prod. v. 3, p. 72. Bambusa stricta, Roxb. Hort. Beng. (1814) p. 25; Dalz. & Gibs. p. 299.—Vinn. Kania báns; Més.

Throughout the Presidency in deciduous forests, Talbot. Konean: planted, Woodrow. Decean: rocky hills, Gamble. Guaran: Panch Mahals, Woodrow. — Discrib. Throughout India; Java. This bamboo is known as the "male bamboo."

Dendrocalamus giganteus, Munro, in Trans. Linn. Soc. v. 26 (1868) p. 150. A gigantic bamboo sometimes grown in gardens, a native of the Malay Peninsula and Penang. It is perhaps the largest bamboo known, the stems reaching 100 ft. high with a diameter of 8-10 in, Stem-sheaths very large, 20 in. long and about as broad at the base, the imperfect blade 5-15 in. long and reaching 3! in. broad. Leaves up to 20 by 4 in., cuspidately acuminate; lignle broad, fimbriate, sometimes cleft in the middle. Inflorescence a very large panicle with slender curved branches. Spikelots \(\frac{1}{2} - \frac{3}{6}\) by \(\frac{1}{3}\) in., many-flowered, ovate, acute, spiny. Anthers \(\frac{1}{2} - \frac{3}{2}\) in. long, acuminate at the tip. Fl. B. I. v. 7, p. 406; Gamble, Bamb. Brit. Ind. (1896) p. 87, t. 76; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 412.—Distrib. Malay Peninsula; Penang.

72. OCHLANDRA, Thw.

Shrabby gregarious reed-like bamboos; stems small, thin-walled, erect; internodes rather long; stem-sheaths thin, persistent, auricles small. Leaves small to moderate-sized, linear or oblong-lanceolate, neuminate, shortly petiolate; leaf-sheaths striate, fringed; ligule usually short. Inflorescence a terminal spike or spike-like panicle on a leafy branchlet; spikelets verticillate, partly fertile, partly sterile. Spikelets 1-flowered, often very large. Invol.-glumes 2-6, variable, usually mucronate, empty; floral glume similar to the transfer of the transfer Palea membranous, not keeled. conspicuous, variable, usually appressed to the filaments. Stamons many, from 6 to 120; anthers large, narrow, usually apiculate. Ovary narrow; style elongate; stigmas 4-6, plumose or papillose. Grain large or very large, evoid, long-beaked, supported by the persistent glumes; pericarp very thick, fleshy.—Distrib. India (W. Peninsula), Ceylon, Malay Peninsula; species 7.

1. Ochlandra Talboti, Brandis, Ind. Trees (1906) p. 684. Stems numerous in dense clumps, slender, $\frac{1}{2}-\frac{1}{4}$ in. in diam., hollow, sometimes scandent; nodes thickened, shining, glabrous. Leaves glabrous, pale, lanceolate, long-acuminate, 8-12 by $1\frac{1}{2}-2\frac{1}{2}$ in., on a petiole $\frac{1}{4}$ in, long;

leaf-sheaths glabrous, the bristles at the mouth early deciduous; ligule bearded. Spikelets in half whorls on a terminal erect spike 4-8 in. long, glabrous or with a few soft hairs at the tips of the glumes, the fertile spikelets few, 1½ in. long. Invol.-glumes 3-6, empty. Lodicules 6, linear, nerved. Stamens 25-40; anthers ½ in. long, minutely apiculate; filaments long, slender. Ovary prolonged into a slender style 1½ in. long; stigmas 5, papillose (Talbot). Grain ovoid, 2-3 by ½ in., narrowed into a long beak, supported by 4 persistent glumes. Flowered in 1896 in N. Kanara and had not been seen in thower for many years till then in that district. Ochlandra Rheedei var. sivagiriana, Talbot, Trees, Bomb. p. 348 (not of Gamble). O. stridula, Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 442 (not of Thwaites).—VLRN. Huda.

KANARA: Talbot.

This bamboo has been identified with O Rheeder var. sitaginiana and with O. stridula, both of which plants flower annually, while this flowers at long intervals according to Mr. Talbot.—Distrin. India, W. Peninsula.

The following non-indigenous plants not belonging to any of the foregoing genera are grown for ornament or for economic use:—

Zea Mays, Linn. Sp. Pl. (1753) p. 971. The well-known Maize or Indian Corn, a tall stout annual monocious grass, a native of America, is cultivated widely to afford a forage for cattle. It is not very largely cultivated for flour in the Bombay Presidency, though on the Panch Maháls it ranks as a staple. It is grown widely for use as a vegetable, the unripe cobs being boiled or roasted. Fl. B. I. v. 7, p. 102; Grah. Cat. p. 240; Dalz. & Gibs. Suppl. p. 100; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 436; Prain, Beug. Pl. p. 1209; Watt, Dict. Econ. Prod. v. 6, part 4, p. 327.—Vern. Buta; Maha.

Avena sativa, Linn. Sp. Pl. (1753) p. 79. The common Oat, so well known and largely used as food for horses in Europe, is rarely cultivated in the Bombay Presidency. It has been grown in Hyderabad (Sind), but has not been found as good for horse-feeding as the Gram (Cicer arietinum). Fl. B. I. v. 7, p. 275; Dalz. & Gibs. Suppl. p. 97; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 440; Prain, Beng. Pl. p. 1217; Watt, Dict. Econ. Prod. v. 1, p. 356.—Venn. Jai.

Arundo Donax, Linn. Sp. Pl. (1753) p. S1. A native of the Lower Himalayas, the Panjáb, Naga, Nilgiri and Kurg Hills, extending to Europe and N. Africa, is often grown as an ornamental grass in clumps in large gardens or on lawns. It is a tall grass 6-10 ft. high, with flowers in large erect thyrsiform decompound panicles 1-2 ft. long. A variegated variety is also grown. Fl. B. I. v. 7, p. 302; Woodr. Gard. in Ind. ed. 5 (1889) p. 548; Journ. Bomb. Nat. v. 13 (1901) p. 410; Prain, Beng. Pl. p. 1218; Watt, Dict. Econ. Prod. v. 1, p. 336.

Triticum satirum, Lam. Flor. Fr. ed. 1, v. 3 (1778) p. 625. Wheat, widely cultivated, but nowhere found wild. Duthie, Fodd. Grass. N. 1nd. (1888) p. 68; Watt, Diet. Econ. Prod. v. 6, part 4, p. 89.

Triticum cestivum, Linn. Sp. Pl. (1753) p. 85; Roxb. Fl. Ind. v. 1. p. 359; Grah. Cat. p. 234; Dalz. & Gibs. Suppl. p. 97. T. vulgare. Villars, Hist. Pl. Dauph. v. 2 (1787) p. 153; Hook. f. Fl. B. I. v. 7. p. 367; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441; Prain, Beng. Pl. p. 1231.—Venn. Gahu; Ghui. The specific name satirum is 9 years prior to that of vulgare.

As is not uncommon in the case of plants under cultivation for a long period, under varying conditions of climate and soil, many varieties or forms exist, of which the two following are those chiefly cultivated

in the Bombay Presidency:—

VAR. spelta. Covered-Grain Wheat; Spelt Wheat. An inferior hard red wheat, the grain covered with a husk of indurated glumes, cultivated widely in the Bombay Presidency. Triticum Spelta (sp.), Linn. Sp. Pl. (1753) p. 86; Woodr, in Journ. Bomb. Nat. v. 13 (1901) p. 411 (Speltum).-Venn. Khapala; Jod-Gahu.

VAR. pilosa. Cultivated widely. The outer glumes are covered with much soft tomentum (Dalzell & Gibson). Triticum pilosum (sp.), Dalz. & Gibs. Bo. Fl. (1861), Suppl. p. 97; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441.—Vern. Bakshi; Kala-Kusali; Kahno.

Hordeum vulgare, Linn. Sp. Pl. (1753) p. 84. Barley. Annual, 2-3 ft. high, supposed by De Caudolle to have originated in Western temperate Asia. It is extensively cultivated in N. India, less extensively in the Bombay Presidency, where it is grown chiefly in Gujarat and Sind, less commonly in the Deccan. Fl. B. I. v. 7, p. 371; Prain, Beng. Pl. p. 1231; Watt, Diet. Econ. Prod. v. 4, p. 274. The three following varieties are cultivated:-

VAR. hexastichon, Aitch. Cat. Pb. & Sind Pl. (1869) p. 171. The most commonly cultivated kind. Spikelets in 6 rows. Fl. B. I. v. 7, p. 371; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441; Watt, Dict. Econ. Prod. v. 4, p. 275. Hordeum hexastichon (sp.), Linn. Sp. Pl. (1753) p. 85; Grah. Cat. p. 234; Dalz. & Gibs. Suppl. p. 96. VERN. Salu; Jau.

VAR. distiction. Cultivated in Sind. Spikelets in 2 rows. Fl. B. I. v. 7, p. 371; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 441; Watt, Diet. Econ. Prodr. v. 4, p. 274. Hordeum distichen (sp.), Linn. Sp. Pl. (1753) p. 85.—Vern. Jau.

VAR. nudum, a beardless variety with spikelets in 2 rows and with the grain free from the palea, known as "Naked or Loose-grained Barley," is cultivated in Gujarat and Sind. Fl. B. I. v. 7, p. 372; Woodr. in Journ. Bomb. Nat. v. 13 (1901) p. 442. Hordeum nudum (sp.), Arduini, ex Schult. Mantiss. v. 2 (1824) p. 437. Hordeum gymnodistiction (var.), Duthie, Fodd. Grass. N. Ind. (1888) p. 70; Watt, Diet. Econ. Prod. v. 4 (1890) p. 274,--Vern. Ua; Ujan.
